It is consistent with the widest experience, that profits are invariably higher in colonies, and thinly-peopled countries, than in countries that have been long settled, and where the population is compatively dense: and that (referring to periods of average duration) their tendency is to fall in the progress of society. This sinking of profits in rich and populous countries was ascribed by Smith to the competition of capitalists. He supposed that when capital is augmented, its owners endeavoured to encroach on each other's employments; and that, in furtherance of their object, they were tempted to offer their goods at a lower price, and to give higher wages to their workmen ; which has a twofold influence in reducing profits. This theory was long universally assented to. It has been espoused by MM. Say, Sismondi, and Storch, by the Marquis Garnier, and, with some trifling modifications, by Malthus. But, notwithstanding the deference due to these authorities, it is easy to see that competition cannot bring about a general fall of profits. It prevents an individual, or set of individuals, from monopolizing a particular branch of industry, and reduces the rate of profit in different businesses nearly to the same level ; but this is its whole effect. It has no tendency to lessen the productiveness of industry, or to raise wages or taxation ; and unless it do one or other of these things, it cannot affect profits. So long as an individual, employing a capital of 1000 quarters, or L.1000, obtains from it a return of 1200 quarters, or L.1200, of which he has to pay 100 quarters, or L.100, as taxes, so long will his profits continue at ten per cent., whether he has the market to himself, or has 50,000 competitors. The increase of taxation, and the necessity under which a growing society is placed of resorting to soils of less fertility to obtain supplies of food, or of bringing them from greater distances, are the great causes of that reduction in the rate of profit which usually takes place in advanced periods. When the last lands taken into cultivation are fertile, there is a comparatively large amount of produce to be divided between capitalists and labourers ; and both profits and real wages may, consequently, be high. But with every successive diminution in the fertility of the soils to which recourse is had, the quantities of produce obtained by the same outlays of capital and labour necessarily diminish.[1] And this diminution will obviously operate to reduce the rate of profit—(1.), by lessening the quantity of produce to be divided between capitalists and labourers ; and (2.), by increasing the proportion falling to the share of the latter.

The influence of the decreasing productiveness of the soil, as well on the condition and fortunes of society, as on the rate of profit, is so very powerful, that we shall endeavour to exhibit its operation a little more in detail. It has been shown over and over again, that the principle of increase in the human race is so very strong, as not only to keep population steadily up to the means of subsistence, but to give it a tendency to exceed them. A peculiar combination of favourable circumstances sometimes makes capital increase faster than population, and wages are in consequence augmented. But such augmentation is rarely permanent, at least to the whole extent ; for the new stimulus it gives to population seldom fails, by proportioning the supply of labour to the increased demand, to reduce wages to their old level, or to one not much above it. If, therefore, it were possible to continue to employ additional capital with an equal return in raising raw produce, in manufacturing it when raised, and in conveying the raw and manufactured products from place to place, it is evident, if we suppose taxation to be invariable, that, speaking generally, the greatest increase of capital would not occasion any sensible fall in the rate of profit. So long as labour may be obtained at the same rate, and as its productive power is undiminished, so long will the profits of stock continue unaffected. It is evident, then, that the mere increase of capital has of itself no lasting influence over wages ; and it is the same thing, in so far as the rate of profit is concerned, whether one hundred or one thousand millions be employed in the cultivation of the soil, or in the manufactures and commerce of this or any other kingdom, provided the last million so employed be as productive, or yield as large a return, as the first. And this is invariably the case with manufactures and commerce. Inasmuch, too, as future Watts, Arkwrights, and Wedgwoods will no doubt arise, and as no limits can be assigned to the improvement of the arts, and of the skill and dexterity of workpeople, it may be confidently predicted that equal amounts of capital and labour employed in manufactures and commerce will continue to furnish increasing quantities of produce. But such is not the case with agriculture. Here, and here only, the bounty of nature is limited, and she deals out her gifts with a frugal and parsimonious hand,

> " Pater ipse COLENDI
> Haud facilem esse viam voluit."

Equal quantities of capital and labour do not always produce equal quantities of raw produce. The soil is of limited extent and limited fertility ; and this limitation is the real check—the insuperable obstacle, which prevents the means of subsistence, and consequently the inhabitants of all countries, from increasing in a geometrical proportion, until the space required for carrying on the operations of industry becomes deficient.

It may be observed, that while this decreasing productiveness of the soil lessens the produce to be divided between profits and wages, it increases the proportion thereof which goes to the latter. It is evidently impossible that the price of raw produce, which is the principal part of the subsistence of the labourer, should be progressively increased by forcing good or taking inferior lands into cultivation, without raising wages. Their rise is seldom indeed exactly coincident with a rise in the price of necessaries, but they can never be very far separated. The price of necessaries forms, in fact, the cost of producing labour. The labourer cannot work or continue his race if he be not supplied with the means of subsistence. And though a certain period of varying extent, according to the circumstances of the country at the time, must generally elapse, when necessaries are rising in price, before wages are augmented, such augmentation must, in all ordinary cases, be eventually brought about, if not to the whole, at least to some considerable extent.

---

[1] This supposes, of course, either that no improvements are made, or that their influence has been taken into account.

Without, however, dwelling on these considerations, and apart from the political revulsions which sometimes act injuriously on industry, it may be safely concluded that the decreasing fertility of the soil, or its inability to continue permanently to yield the same quantities of produce in return for the same outlays, is at bottom the great cause, the *causa causans*, of that fall of profits which uniformly takes place in the progress of society. Other causes may, and frequently do, conspire to bring about this result, but this only is necessary and inherent in the order of nature.

But though this cause of the reduction of profits be "of such magnitude and power as finally to overwhelm every other,"[1] its energy is at all times liable to be counteracted or facilitated by extrinsic circumstances. It is obvious, for example, that every improvement or discovery in husbandry which enables a greater quantity of produce to be obtained for the same expense, has an influence similar to what would result from an addition being made to the area of the superior lands, and may, for a lengthened period, raise the rate of profit or hinder its fall.

Had the inventive genius of man been limited in its powers, and had the various machines and implements used in agriculture, and the skill of the husbandman, speedily attained to perfection, the rise in the price of raw produce, and the fall of profits consequent to the increase of population, would have been so apparent as to force themselves on the attention of every one. When, in such a state of things, it became necessary to resort to poorer soils to raise additional quantities of food, a corresponding increase of labour would have been required; for, supposing the perfection of art to be attained, nothing except greater exertion can overcome fresh obstacles. Not only, therefore, would additional labour have been required for the production of a greater quantity of food, but it would have been required in the precise proportion in which the difficulty of its production was increased; so that, had the arts continued stationary, the price of corn and other raw products would have varied directly with every variation in the qualities of the soils successively brought under tillage.

But the circumstances which really regulate the value of raw produce are extremely different. It is true, indeed, that even in those societies that are most rapidly improving, it has, as previously shown, a constant tendency to rise; for the rise of profits consequent to every invention, by occasioning a greater demand for labour, gives a fresh stimulus to population; and thus, by increasing the demand for food, again inevitably forces the cultivation of poorer soils, and raises prices. But these effects of this great law of nature, from whose all-pervading influence the utmost efforts of human ingenuity cannot enable man to escape, are rendered far less palpable and obvious, and sometimes, indeed, are entirely defeated by means of improvements. After inferior soils are cultivated, more labour is required to raise the same quantities of food; but as the powers of the labourer, and the implements he employs, are gradually improved, a smaller number of work-people is required, in proportion to the work to be performed, than if no improvements had taken place. The tendency to an increase in the price of raw produce is countervailed by an opposite tendency. The productive energies of the earth gradually diminish, and we are compelled to resort to less fruitful soils; but the productive energies of the labour employed in their tillage are as constantly augmented by the discoveries and inventions that are always being made. Two opposite and continually acting principles are thus set in motion. From the operation of fixed and permanent causes, the increasing sterility of the soil is pretty sure, in the long run, to overmatch the improvements that occur in machinery and agriculture, so that prices experience a corresponding rise, and profits a corresponding fall. Occasionally, however, these improvements more than compensate, during lengthened periods, for the deterioration in the quality of the soils successively cultivated, and a fall of prices and rise of profits take place, until the renewed pressure of population once more forces the cultivation of still poorer lands.

In so far as the general principle is concerned, the previous reasoning is applicable alike to the commercial world and to a single nation. It is plain, however, that the fall of profits, and the check to the progress of society, originating in the necessity of resorting to poorer soils, will be earlier and more severely felt in improving countries which exclude foreign corn from their markets, than in those which maintain an unfettered intercourse with their neighbours. When a great manufacturing and commercial country deals with all the world on fair and liberal principles, she avails herself of the various capacities of production which Providence has given to different countries; and besides obtaining supplies of food at the cheapest rate at which they can be raised, the numberless markets to which she can resort prevents her from feeling any very injurious consequences from the occasional failure of her own harvests, or from deficiencies in one or a few of the sources whence she draws her foreign supplies; so that in this way she goes far to secure for herself constant plenty, and, what is of hardly less importance, constant steadiness of price. Such a nation has the foundations of her greatness established on a broad and solid basis; for they rest, not on the productive powers of her own soil only, but on those of all the countries of the world. And supposing her not to be involved to an unusual degree in war, or subjected to comparatively heavy taxes, her profits would not be reduced, nor would she get clogged in her progress, until the increase of population forced the cultivation of inferior soils in the countries whence she was in the custom of importing corn. And even then she would not be surpassed by her neighbours; her progress being retarded by a cause which equally affected them, her relative power would not be impaired; and should new markets be opened or new discoveries made, in any quarter of the world, she would reap her full share of the advantage, and be renovated and strengthened for a new career of exertion.

But the case is very different when foreign raw produce is excluded from the markets of a nation which has made an unusual progress in commerce and manufactures, and whose population is therefore comparatively dense. A government which prevents its subjects from exchanging their manufactured goods for the corn of more fertile or less densely-peopled countries, compels them to a premature resort to poor soils at home; and profits being consequently reduced, the country is made to approach the stationary state at a period when, had the legislature acted on more enlarged principles, she might have been advancing with the same rapidity as before in the career of improvement.

It is needless, however, to dwell on these circumstances, or to show the influence of restrictions on the trade in raw produce in aggravating the evils of scarcity, and occasioning fluctuations of price. These and other important correlative matters are discussed in the article CORN LAWS AND CORN TRADE in this work. In it the reader will find the history as well as the principles and practical operation of the late Corn Laws, treated of at considerable length.

PART IV.

CONSUMPTION OF WEALTH.

Having in the previous parts endeavoured to explain the means by which labour is facilitated, and wealth produced, and to investigate the laws which regulate its distribution among the various classes of society, we come now to the *fourth* and last division of the science, or to that which treats of the CONSUMPTION of Wealth.

Definition of Consumption.—Consumption the end of Production.—Test of Advantageous and Disadvantageous Consumption.—Error of Dr Smith's Opinions with respect to Unproductive Consumption.—Error of those who contend, that to facilitate Production, it is necessary to encourage Consumption.—Cause of Gluts.—Consumption of Government.—Conclusion.

Definition of consumption.

It was formerly seen, that by production in this science, is not meant the production of matter, that being the prerogative of Omnipotence, but the giving to matter such a shape as might fit it for ministering to our wants and enjoyments. In like manner, by consumption is not meant the consumption or annihilation of matter, that being as impossible as its creation, but *the consumption or annihilation of the qualities which render commodities useful and desirable.* To consume the products of art or industry, is to deprive them of the utility, and consequently of the value, communicated to them by labour. And hence we are not to measure consumption by the magnitude, weight, or number of the products consumed, but exclusively by their value. Large consumption is the destruction of large value, however small the bulk in which it may happen to be compressed.

Consumption the end of production.

Consumption, in the sense in which the word is used by political economists, is synonymous with use. We produce commodities only that they may be used or consumed. Consumption is the end and object of human industry ; production is merely a means to attain that end. It matters nothing in this respect whether commodities are of the class called durable or perishable. The bread that is baked in the morning may be made use of in the course of the day ; whereas the use of other articles may extend over weeks, or months, or even many years. But, however widely they may differ in their qualities, and whether they are employed to satisfy the urgent wants, to increase the riches, or to gratify the social or the selfish passions of their possessors, they are all destined to be used or consumed ; to be made serviceable in some way, or for some purpose or other.

Test of advantageous consumption.

But though commodities are produced only to be consumed, we must not fall into the error of supposing that all consumption is equally advantageous to the individual or the society. If a gentleman employ a set of labourers to build him a house the one summer, and to pull it down the next, the wages paid them while they are engaged in this futile occupation are evidently lost to their employer and the public ; whereas had he employed them in husbandry or manufactures he would most likely have obtained products equal to, or more valuable than, their wages. The value of the return, or the advantage obtained from consumption, is the true test whether it is advantageous or disadvantageous, or as it is more commonly termed, productive or unproductive. Commodities are consumed productively when the advantage or benefit, whether material or otherwise, accruing in consequence to their possessors, exceeds their value ; and they are consumed unproductively when such advantage or benefit is less than their value. The prosperity and decay of nations depends on this balance. If, in given periods, the commodities produced in a country exceed those consumed in it, the means of increasing its capital are provided, and its population will increase, or the actual numbers be better accommodated, or both. If the consumption in such periods fully equals the reproduction, the stock or capital of the nation not being increased, society will be at a stand. And if the consumption exceed the reproduction, every succeeding period will see the society worse supplied ; its prosperity and population will evidently decline, and pauperism will gradually spread itself over the country.

It is impossible, however, to fix on any standard by a comparison with which even a tolerable approximation may be obtained of the value or advantage of different kinds of consumption. This is a point on which the sentiments of no two individuals ever exactly coincide. The opinions of each always depend more or less on the situation in which he is placed. A rich man is inclined to give a greater extension to the limits of advantageous consumption than a man of middling fortune ; and the latter than he who is poor. And it is a truism to say that a man's expenses should always bear some proportion to his fortune and condition in society ; and that what might be proper and advantageous expenditure in one case, might be exceedingly improper and indeed absurd in another. Hence it is quite impracticable to frame any system of rules with regard to expenditure applicable to all individuals ; and were it practicable, there is no ground for thinking that they would be of the smallest utility. The public interest requires that the national capital should, if possible, be constantly kept on the increase ; or, which is the same thing, that the consumption of any given period should become the means of reproducing a greater value. But it has been sufficiently proved that this desirable result cannot, under any circumstances, be brought about by a system of *surveillance* and restriction. Industry and frugality never have been, and never will be, promoted by such means. To render a man industrious, secure him the peaceable enjoyment of the fruits of his industry :—to wean him from extravagance, and make him frugal and parsimonious, allow him to reap all the disadvantage of the one line of conduct, and all the advantage of the other. The poverty and loss of station that inevitably result from improvident and prodigal consumption are a sufficient security against its becoming injuriously prevalent. Wherever the public burdens are moderate, property protected, and industry free, the efforts of the body of the people to rise in the world and improve their condition occasion the continued increase of national wealth. It is idle to expect that all unproductive and unprofitable expenditure should ever be avoided ; but the experience of all tolerably well governed states proves, that the wealth which is productively expended, greatly exceeds that which is expended unproductively.

Luxury not disadvantageous.

It was long a prevalent opinion among moralists, that the production and consumption of luxuries was essentially unproductive. But this opinion is now almost universally abandoned. Unless, indeed, all comforts and enjoyments are to be proscribed, it is not possible to say where necessaries end and luxuries begin. But if we are to understand by necessaries such products only as are absolutely required for the support of human life, everything but wild fruits, roots, and water, must be deemed superfluous ; and in this view of the matter, it would follow that the peasantry of Ireland when they lived only on potatoes and butter-milk, had much more of the character of productive labourers than those of Britain! The mere statement of such a doctrine is sufficient for its refutation. Everything that stimulates exertion is advantageous. The mere necessaries of life may be obtained with comparatively little labour; and those savage and uncivilized hordes, who have no desire to possess its comforts, are proverbially indolent and dissipated. To make men industrious,—to make them shake off what seems to be their natural lethargy,—they must be inspired with a taste for the luxuries and enjoyments of civilized life. When this is done, their artificial wants become equally clamorous with those that are strictly necessary, and they increase exactly as the means of gratifying them increase. Wherever a taste for comforts and conveniences is generally diffused, the wants and desires of man become altogether illimitable. The gratification of one leads directly to the formation of another. In civilized societies, new products and new modes of enjoyment are constantly presenting themselves as motives to exertion, and as means for its reward. The operations of industry are prosecuted without intermission, and idleness, with its attendant train of evils, almost entirely disappear. "What," asks Paley, "can be less necessary, or less connected with the sustentation of human life, than the whole produce of the silk, lace, and plate manufactory? Yet what multitudes labour in the different branches of these arts! What can be imagined more capricious than the fondness for tobacco and snuff? Yet how many various occupations, and how many thousands in each, are set at work in administering to this frivolous gratification!" The stimulus given to industry by the desire to possess these articles renders their introduction advantageous. The earth is capable of furnishing food adequate for the support of a much greater number of human beings than can be profitably employed in its cultivation. But its owners will not part with their produce for nothing; or rather they will not raise what they can neither use themselves nor employ to buy what they want. As soon, however, as a taste for conveniences and luxuries is introduced, this difficulty is got over. The occupiers of the ground forthwith endeavour to raise from it the most that it can be made to produce, that they may exchange the surplus for the articles offered to them by manufacturers and merchants. And hence, though the latter have neither property in the soil, nor any concern in its cultivation, they are regularly and liberally supplied with its produce. In this way the quantity of necessaries, as well as of useful and agreeable products, is vastly increased by the introduction of a taste for luxuries; and while the people are infinitely better provided for, their numbers are greatly augmented.

So long, therefore, as the consumption of luxuries is confined within proper limits, it is quite unexceptionable. But when it exceeds these limits, that is, when it is greater than the consumers can afford, it becomes injurious. The injury, however, would be quite as great if they consumed an equivalent amount of necessaries. The mischief consists in the cost or value of the articles consumed exceeding the means of the consumers, and not in their belonging to this or that description or species of articles. But, except in cases where credit has been obtained through fraudulent representations, this is a fault which may be safely left to be dealt with by those concerned. The poverty and degradation that are sure to result from reckless consumption is a sufficient guarantee against its being carried to an injurious extent. To attempt to lessen it by proscribing luxury, is like attempting to enrich a country by taking away some of the most powerful motives to production.

Smith's criterion of productive and unproductive consumption.

Adam Smith has given another criterion of productive and unproductive consumption. But though exceedingly ingenious, and supported with his usual ability, his opinions on this point appear to rest on no solid foundation. He divides society into two great classes. The *first* consists of those who fix, or, as he terms it, "realize their labour in some particular subject, or vendible commodity, which lasts for some time at least after that labour is past;" the *second*, of those whose labour leaves nothing in existence after the moment of exertion, but perishes in the act of performance. The former are said by Smith to be *productive*, the latter *unproductive* labourers. Not that, in making this distinction, he meant to undervalue the services rendered by the latter, or to deny that they are frequently indispensable. But he contends that, how advantageous soever, these services not having any results of a fixed and transferable character, add nothing to the wealth of a country; and that, consequently, the labour of those by whom they have been rendered has been unproductively expended. To avoid, however, all chance of misrepresentation, we shall give Smith's opinions in his own words.

"There is one sort of labour," says he, "which adds to the value of the subject upon which it is bestowed; there is another which has no such effect. The former, as it produces a value, may be called productive, the latter unproductive labour. Thus the labour of a manufacturer adds generally to the value of the materials which he works upon, that of his own maintenance, and of his master's profit. The labour of a menial servant, on the contrary, adds to the value of nothing. Though the manufacturer has his wages advanced to him by his master, he in reality costs him no expense, the value of those wages being generally restored, together with a profit, in the improved value of the subject upon which his labour is bestowed. But the maintenance of a menial servant never is restored. A man grows rich by employing a multitude of manufacturers; he grows poor by maintaining a multitude of menial servants. The labour of the latter, however, has its value, and deserves its reward, as well as that of the former. But the labour of the manufacturers fixes and realizes itself in some particular subject, or vendible commodity, which lasts for some time at least after that labour is past. It is, as it were, a certain quantity of labour stocked and stored up, to be employed, if necessary, upon some other occasion. That subject, or, what is the same thing, the price of that subject, can afterwards, if necessary, put into motion a quantity of labour equal to that which had originally produced it. The labour of the menial servant, on the contrary, does not fix or realize itself in any particular subject or vendible commodity. His services generally perish in the very instant of their performance, and seldom leave any trace or value behind them for which an equal quantity of service could afterwards be procured.

"The labour of some of the most respectable orders in the society is, like that of menial servants, unproductive of any value, and does not fix or realize itself in any permanent subject or vendible commodity, which endures after that labour is past, and for which an equal quantity of labour could afterwards be procured. The sovereign, for example, with all the officers both of justice and war who serve under him, the whole army and navy, are unproductive labourers. They are the servants of the public, and are maintained by a part of the annual produce of the industry of other people. Their service, how honourable, how necessary, or how useful soever, produces nothing for which an equal quantity of service can afterwards be procured. This protection, security, and defence of the commonwealth, the effect of their labour this year, will not purchase its protection, security, and defence for the year to come. In the same class must be reckoned some both of the gravest and most important, and some of the most frivolous professions: churchmen, lawyers, physicians, men of letters of all kinds; players, buffoons, musicians, opera-singers, opera-dancers, &c. The labour of the meanest of these has a certain value, regulated by the very same principles which regulate that of every other sort of labour; and that of the noblest and most useful produces nothing which could afterwards purchase or produce an equal quantity of labour. Like the declamation of the actor, the harangue of the orator, or the tune of the musician, the work of all of them perishes in the very instant of its production." (*Wealth of Nations*, p. 146.)

Smith's distinction between the different classes of society shown to be ill-founded.

It will not, we think, be very difficult to show the fallacy of the distinction which Smith has endeavoured to establish in the paragraphs now quoted, between the labour, and consequently also the consumption of the different classes of society. To begin with the case of the menial servant:—His labour is said to be unproductive, because it is not realized in a vendible commodity, whereas the labour of the manufacturer is productive, because it is so realized. But of what, may we ask, is the labour of the manufacturer really productive? Does it not consist of comforts and conveniences required for the use and accommodation of society? The manufacturer is not a producer of matter, but of utility only. And is it not obvious that the menial servant is also a producer of utility? If the labour expended in converting the wool when in the fleece into a coat be, as no one doubts, productive, then surely the labour expended in cleaning and brushing the coat, and rendering it fit to be worn, must be so too. And if the husbandman who raises corn, beef, and other articles of provision, be a productive labourer, why is the menial servant who performs the indispensable task of dressing these articles, and fitting them to be used, to be stigmatized as unproductive? It is clear there is no substantial difference between their employments—that they are either both productive, or both unproductive. To have a fire, it is quite as necessary that coals should be brought from the cellar to the stove, as that they should be brought from the bottom of the mine to the surface of the earth. And if it be said that the labour of the miner is productive, must we not say as much of that of the servant employed to make and mend the fire? The whole of Smith's reasoning proceeds on a false hypothesis. He has made a distinction where there is none, and can be none. The end of all human exertion is the same—that is, to increase the sum of necessaries, comforts, and enjoyments; and it must be left to the judgment of every man to determine what portion of these he will have in the shape of services, and what in the shape of material products. A man is not more readily impoverished by maintaining menial servants than by indulging in any other species of expense. Doubtless he will be ruined if he keep more of them than he has occasion for, or can afford to pay; but his ruin will be equally certain if he purchase an excess of food or clothes, or engage a greater number of workpeople in his business than are required to carry it on, or his capital can employ. The keeping of two ploughmen when one only might suffice, is as improvident and wasteful as the keeping of two footmen to do the business of one. It is in the extravagant quantity or cost of the things or services we require, irrespective of anything else, that we must seek for the causes of impoverishment.

Case of the physician.

The same reasoning applies to all the instances mentioned by Smith. Take, for example, the case of the physician. He is classed, like the menial servant, among the unproductive labourers, because the bodies on which he exerts his art are not vendible or exchangeable. But if so, then it is plain that the veterinary surgeon who has charge of horses and dogs, will be entitled to rank in the productive class; and when the physician prescribes for and cures a slave, he also will become productive! Without, however, insisting on such self-contradictory statements, is it not clear that if the exertions of the physician conduce to health, and if he enable others to produce more than they could do without his assistance, he is, indirectly at all events if not directly, a productive labourer? Smith makes no scruple about admitting that a workman employed to repair a steam-engine should be enrolled in the productive class; and yet he would place a physician, who had been instrumental in saving the life of an Arkwright or a Watt among those that are unproductive! It is singular that he was not struck by such flagrant inconsistencies. And the errors into which he has fallen in treating this important branch of the science, set in a strong light the necessity of advancing with extreme caution, and of subjecting every theory, how ingenious soever it may appear when first stated, to a severe and patient examination.

The amusements furnished by players, singers, and so forth, come under the description of luxuries, and have the same effect on the public wealth as a taste for champagne, tobacco, tea, or other superfluities. They create new wants, and, by so doing, stimulate industry to procure the means of gratifying them. They are really, therefore, a means of production; and while they furnish fresh comforts and amusements, they add to the mass of useful products.

Public functionaries productive labourers.

The productiveness of the higher class of functionaries is still more obvious. Far, indeed, from being unproductive, they are, when they properly discharge the duties of their high station, the most productive labourers in a state. Smith says, that the results of their service, that is, to use his own words, "the protection, security, and defence of the commonwealth any one year, will not purchase its protection, security, and defence for the year to come." But this is plainly an error. He allows that the food and other articles produced by society in any given year, furnish in great part the means of producing its supplies of the same articles for the succeeding year. But without the security and protection afforded by government, these articles would either not exist at all, or their quantity would be very greatly diminished. How, then, is it possible to deny that those by whom this security is afforded are productively employed? Take the case of the labourers who construct fences: no one ever presumed to doubt that their labour is productive; and yet they do not contribute directly to the raising of corn or anything else. The object of their industry is to give security; to guard the fields that have been fertilized and planted from depredation, and to enable the husbandman to prosecute his employments without being distracted by the care of watching. But if those who defend a single corn field against the neighbouring crows and cattle, are justly said to be productive labourers, on what pretence shall we deny that title to the judges and magistrates, the soldiers and sailors, who protect every field in the empire?—to those to whose exertions we are indebted for our independence, and the free enjoyment of our property and privileges?

That much wealth has been unproductively consumed by the servants of the public, both in this and other countries it is impossible to doubt. But we are not to argue, from abuses extrinsic to a benefical institution, against the institution itself. If the public pay their servants excessive salaries, or employ more than are required for the purposes of good government and security, it is their own fault. Their conduct is similar to that of a manufacturer who should pay his labourers comparatively high wages, and employ more of them than he had occasion for. But though a state or an individual may act in this foolish and extravagant manner, it would be not a little rash thence to conclude that all public servants and all manufacturing labourers are unproductive! If the establishments which provide security and protection be formed on an extravagant scale, if there are more judges and magistrates, more soldiers or sailors, than are necessary, or if they receive larger salaries than would suffice to procure the services of others quite as competent to discharge their duties, let their numbers and their salaries be reduced. The excess, if there be any, is not a fault inherent in the nature of such establishments, but results entirely from the extravagant scale on which they are arranged.

Consumption ought not to be encouraged for the sake of stimulating production.

But, in showing that Smith was mistaken in calling the consumption of menial servants, lawyers, physicians, and public functionaries, unproductive, we must beware of falling into the opposite extreme, and of countenancing the erroneous and infinitely more dangerous doctrine of those who contend that consumption, even when most unproductive, should be encouraged as a means of stimulating production, and of increasing the demand for labour! The consumption of the classes mentioned by Smith is advantageous, because they render services in return, which those who employ them, and who are the only proper judges, consider of greater value than the wages they pay them. But the case would be totally different were government, capitalists, and others, to employ labourers not to profit by their services, but to stimulate production by their consumption. It is a fallacy to suppose, as many do, that production is encouraged by a wasteful consumption of the products of industry. A man is stimulated to produce when he finds a ready market for the produce of his labour—that is, when he can readily exchange it for other products. And hence the only legitimate encouragement of industry consists in the increase of production, and not in the increase of wasteful and improvident consumption. Every new article forms a new equivalent for, or means of purchasing some other article. It must always be remembered, that the mere existence of a demand, how intense soever it may be, cannot of itself be a means of encouraging production. "The sale of articles," to use the words of Paley, "depends upon the number, not of those who want, but of those who have something to offer in return for what they want; not of those who would consume, but of those who can buy; that is, upon the number of those who have the fruits of some other kind of industry to tender in exchange for what they stand in need of."[1] The more, therefore, that these fruits are increased, that is, the more industrious individuals become, their power to buy or to offer products of one sort or other in exchange for what they stand in need of, will be proportionally increased, and the market rendered so much the more extensive.

nproduc-
ve con-
mption
ot neces-
ry to pre-
ent gluts.

It was contended by Sismondi and Malthus, in opposition to this doctrine, that the productiveness of industry may be carried to excess, and that where it is peculiarly efficient a large unproductive consumption is necessary to prevent the overloading of the market. But if we attend to the motives which make men engage in industrial undertakings, we shall be satisfied that the apprehensions of these writers are unfounded, and that the greatest facility of production cannot occasion a permanent glut of the market, or require to be countervailed by means of unproductive expenditure. In exerting his productive powers, every man intends either to consume the produce himself, or to exchange it for such articles as he wishes to get from others. If he do the first,—if he consume the articles he produces, there is an end of the matter, and it is evident that no conceivable increase of such articles could occasion a glut: If he do the second, —if he bring them to market, and offer them in exchange for other things, then, and then only, there may be glut. But why? Not because there has been an excess of production, but because the proper things have not been produced. A., for example, wished to obtain silks, and he manufactured cottons, and offered them in exchange to the holders of silks. But the latter did not want cottons, but broad cloths. And hence the glut in this case (and what is true of it, is true of every other case) does not originate in over-production, but in the production of articles which were not wanted, instead of articles which were. Let this error be rectified, and the glut will disappear. Even on the very improbable supposition that the holders of silks are supplied with cloth and everything else which those who wished to trade with them had it in their power to offer, the principle for which we are contending would not be in any degree invalidated. Such parties as cannot get the articles they want by means of an exchange are not at their wits' end; but would forthwith turn their industry into other channels, and, instead of producing their equivalents, would set about directly producing the articles themselves, or substitutes that might be used in their stead. Production is never carried on except as a means to an end; and if it be rightly adapted to compass that end, it is contradictory to suppose it can be too great. Owing to miscalculations of one sort and another there is often an excess of one or of a few articles; but it is quite impossible that there should be an universal glut. For every surplus, on the one hand, there must be a corresponding deficiency on the other. The fault is not in producing too much, but in producing commodities which are not suited to those to whom we wish to sell them, or which we cannot ourselves make use of. If we attend to these two grand requisites, we may increase the power of production ten or twenty times, and yet be as free of all excess as if we diminished it in the same proportion. Unproductive consumption is not therefore required to prevent the overloading of the market; and though it were, no government would be justified in carrying it on for such a purpose.[2]

It must, however, be remembered, consistently with what has been previously advanced, that in deciding as to the character of the consumption or expenditure of wealth, we must look at its indirect and ultimate, as well as its direct and immediate effects. An expenditure which, if we take its immediate results only into account, we should pronounce improvident and unproductive, may yet be discovered, by looking at it in its different bearings, and in its remote influences, to be distinctly the reverse; and it is also true that cases frequently occur in which that expenditure which is ruinous to the individual may, by stimulating industry in others, be beneficial to the state.

Montesquieu has said, "*Si les riches ne dépensent pas beaucoup, les pauvres mourront de faim.*"[3] The truth of this proposition has, however, been disputed; and this is not to be wondered at, as it may be either true or false, according to the sense in which it is understood. If it be construed to mean that a rich man will be able continuously to employ a greater number of servants or labourers if he spend his revenue in luxurious accommodations than if he lay out a part of it on the improvement of his estate, or in accumulating a provision for his younger children, it is plainly erroneous. An increased demand for labour is the effect of an increased amount of capital; and as those who spend their whole incomes cannot amass capital, so neither can they employ a greater number of labourers. But the proposition advanced by Montesquieu should not be interpreted in this confined sense, or as being restricted to the direct influence of the demand of the rich for the services of the poor, but as also referring to and comprising its indirect influence over the demand of the middle classes and society in general for these services. And if we so interpret it, and suppose it to mean that the lavish expenditure and luxury of the great and affluent becomes a means of materially benefiting the poor, by exciting the emulation of others, who cannot expect, except through an increase of industry and economy, to be able to indulge in a similar scale of expense, it will, we apprehend, be found to be perfectly correct. To suppose, indeed, that the passion for luxurious gratifications should decline amongst the rich, and that men should, notwithstanding, continue equally industrious, is a contradiction. Riches are desirable only because they afford the means of obtaining these gratifications; and so powerful is the influence of a taste for them, that it may be doubted whether the extravagance which has ruined so many individuals has not been, by giving birth to new arts and new efforts of emulation and ingenuity, of material advantage to the public.

---

[1] *Moral Philosophy*, b. vi., cap. 11.

[2] M. Say was the first who showed in a satisfactory manner that effective demand depends upon production. (See his chapter *De Debouchés.*) But the principles from which his conclusions are drawn had been stated so early as 1752 in a tract of Dean Tucker, entitled *Queries on the late Naturalization Bill.* As this tract is now become of rare occurrence, we subjoin the queries referred to:—"Whether it is possible in the nature of things for all trades and professions to be overstocked? and whether, if you were to remove any proportional number from each calling, the remainder would not have the same grounds of complaint they had before?—Whether, in fact, any tradesman thinks there are too many of other occupations to become his customers; though narrow selfish views lead him to wish there were fewer of his own trade?—If a particular trade be at any time overstocked, will not the disease cure itself? that is, will not some persons take to other trades, and fewer young people be bred up to that which is least profitable? and whether any other remedy but this is not in fact curing one transient disorder by bringing on many which are dangerous, and will grow inveterate?—Whether it is not an infallible maxim that one man's labour creates employment for another?" p. 13. For a further demonstration of the same principle see Mill's *Commerce Defended*, p. 80.

[3] *Esprit de Loix*, liv. vii., cap. 4.

These remarks are not made in the view of countenancing extravagant expenditure, but to show that those who attempt to decide as to the influence, in a public point of view, of an outlay of wealth, without endeavouring to appreciate and weigh its remote as well as its immediate effects, must, when they are right in their conclusions, be so only through accident. But without insisting farther on this point, it is abundantly certain that there is nothing to fear from the improvidence of individuals. No people, as has been already observed, ever misses an opportunity to save and amass. In all tolerably well-governed countries the passion for accumulation has always had a decided ascendancy over the passion for expense.

The incomes of individuals being, in the vast majority of cases, the result of their own industry and frugality, they are fully conscious of the sacrifice which their expenditure compels them to make, and endeavour, with but few exceptions, to confine it within the narrowest limits. This, however, is but seldom the case with the consumption of governments and their servants. They do not consume their own wealth, but that of others; and this circumstance prevents them from being so much interested in its profitable outlay, or so much alive to the injurious consequences of wasteful expenditure, as their subjects. But, though more difficult to practise, economy on the part of governments is of infinitely greater importance than economy on the part of individuals. A private gentleman, being master of his own fortune, may dispose of it as he pleases. He may act on the erroneous principle of profusion being a virtue, or he may attempt to excite the emulation and industry of his fellow-citizens by the splendour of his equipages and the magnificence of his mode of living. But government can with propriety do none of these things. It is merely a trustee for the affairs of others, which it is bound to administer as economically as possible. Were the principle admitted, that money might be raised to excite industry and ingenuity by the pressure of taxation or the luxury of public functionaries, an avenue would be opened to every species of malversation. It is, indeed, pretty certain that no people would submit to be taxed for such purposes; but if they did, the flagrant abuses to which it would inevitably lead could hardly fail of ending either in revolution or in national poverty and degradation. Economy in expenditure is, upon all occasions, the first virtue of a government, and the most pressing of its duties.

Conclusion.

We have now seen how labour may be rendered most productive of wealth—how that wealth is distributed among the various classes of society—and how it may be most advantageously consumed. We have seen the indissoluble connection between private and public opulence; that whatever has any tendency to increase the former, must to the same extent increase the latter; and that SECURITY OF PROPERTY, FREEDOM OF INDUSTRY, AND MODERATION IN THE PUBLIC EXPENDITURE, are the only, as they are the certain means by which the various powers and resources of human talent and ingenuity may be called into action, and society made continually to advance in the career of wealth and civilization. Owing to the different dispositions and capacities of individuals, and the widely different circumstances under which they are placed, they will no doubt continue to exhibit in time to come, as they have done hitherto, great differences in their situation and conduct. But the adoption of a well-digested system of public economy is sure, notwithstanding, to conduce to their general well-being. While it adds to the numbers and wealth of the rich, it makes still greater additions to the numbers and wealth of the middle classes, and raises the poor more nearly to a level with the others. The latter, indeed, are now in possession of a vast number of conveniences and luxuries which formerly could not be commanded even by the richest lords. In a well-constituted society, all who pursue their occupations with diligence, perseverance, and economy, may reasonably expect to realize the advantages attached by Providence to such conduct. At all events, that is the only way in which their condition can be honourably, and therefore beneficially improved, and the public wealth augmented. It is by the spontaneous and unconstrained, but well-protected efforts of individuals to improve their condition and rise in the world that nations become rich and powerful. Their labour and their savings are at once the source and the measure of national opulence and public prosperity. They may be compared to the drops of dew, which invigorate and mature all vegetable nature. None of them has singly any perceptible influence; but we owe the foliage of summer and the fruits of autumn to their combined action. (J. R. M.)

POLL, a word used in ancient writings for the head. Hence *to poll* is either to vote, or to enter down the names of those persons who give their votes at an election.

POLLA, La, a town of Naples, in the province of Principato Citra, on a hill at the entrance of the beautiful, fertile, and populous Val di Diano, 10 miles N.N.W. of La Sala. It has a number of churches and monastic institutions; and there are manufactures of silk and coarse woollen cloth. The Negro, which is here a considerable river, suddenly disappears at the foot of the hill on which the town is built, and flows underground for 2 miles as far as Pertosa. Pop. 5000.

POLLEN. See Botany.

POLLAJUOLO, Antonio, an eminent goldsmith and painter, was born at Florence in 1426. Apprenticed in his youth to the famous goldsmith Lorenzo Ghiberti, he soon rose to the place that was suitable for the exercise of his genius. The exquisite touch of his chisel immediately marked him out among his fellow-pupils. In the fabrication of the celebrated bronze gates of San Giovanni he became his master's chief assistant, and surpassed all the other coadjutors in correct design and patient execution. His increasing excellence soon enabled him to open a shop for himself, and to take the first place in his profession. He established his reputation and immortalized his name by working in silver, for the altar of San Giovanni, a series of stories representing the "Feast of Herod" and the "Dance of Herodias' Daughter." Pollajuolo next became a competitor for the fame of a painter. Placing himself under the tuition of his younger brother Pietro, he acquired the art in a few months. Then applying himself to anatomy, a subject which no artist had ever studied before him, he became especially excellent in representing the action of the muscles. A work representing the martyrdom of St Sebastian, and called by Lanzi "one of the best pictures of the fifteenth century," still remains in the church of San Sebastiano de' Servi, to be a specimen of his artistic skill. Pollajuolo spent his last years in Rome, working in bronze the tomb of Sextus IV. He died in that city in 1498. Intimately associated with the name of Antonio Pollajuolo is that of his brother Pietro. Only two years his junior, Pietro instructed him in painting, assisted him in executing many of his pictures, died in the same year, and was buried in the same tomb in San Pietro in Vincoli. (See Lanzi's *History of Painting*, and Vasari's *Painters*, &c.)

POLLENZA, a town in the island of Majorca, on the north coast, 28 miles N.E. of Palma. The houses are well built, and the streets paved. There are a handsome church, a town-hall, hospital, prison, and schools. Black woollen cloth is made here, as well as some other articles; and there is some trade in oil and wine. The bay, 2 miles to the east, is large, and sheltered on all sides but the N.E. Pop. 6402.

POLLIO, Caius Asinius, a distinguished orator, poet, and historian of the Augustan age, was descended from a family of the Marrucini, and was born B.C. 76. He had consequently frequent opportunities during his youth of hearing Cicero, Cæsar, Hortensius, and the other great orators of his day. He attempted early to signalize himself by accusing C. Cato, B.C. 54, when in his twenty-second year, but the powerful influence of Pompey proved too great for him. He espoused Cæsar's party when a rupture took place between Pompey and Cæsar, joined his army in Cisalpine Gaul, accompanied him across the Rubicon, served with him in the campaign against Pompey at Pharsalia, B.C. 48, and fought at his side against the Pompeian party in Africa. On his return to Rome, he was created *prætorius*, B.C. 44; and shortly after was sent to Spain. March of the same year saw the death of Cæsar; and Asinius Pollio well-nigh lost his life in fighting against Sextus Pompey. He joined the triumvirate of Octavian, Antony, and Lepidus, and had assigned to him the difficult task of being administrator of Transpadane Gaul. It was at this juncture that he saved the property of the poet Virgil at Mantua from being confiscated. On his return to Rome, he became consul, and had the honour to have addressed to him the fourth Eclogue of Virgil. In 39 B.C. Antony sent him with a portion of his army to fight against the Parthini; and his success was the means of gaining him a triumph, and the eighth Eclogue of Virgil. From this time he seems to have withdrawn altogether from political life, and to have devoted himself to the study of literature. He lived to see Augustus fully established in his reign, when he died at his Tusculan villa, A.D. 4.

Asinius Pollio was the first to establish a public library at Rome. He was likewise the patron of Virgil and Horace (*Carmen* ii. 1), not to speak of other eminent poets and writers. None of Pollio's works have come down to us. Besides his speeches, he was author of a history of the civil wars, in seventeen volumes, besides tragedies, which have led his contemporaries and successors to class his name with those of Cicero, Virgil, and Sallust, as an orator, a poet, and a historian. The reader may consult Eckhard's *Commentatio de C. Asinio*, Jena, 1793; Thorbecke's *Commentatio de C. Asinii Pollionis Vita et Studiis*, Lugd. Batav., 1820; and Smith's *Dictionary of Biog. and Myth.*, London, 1851.

POLLOCKSHAWS, a burgh of barony and town of Scotland, in the county of Renfrew, on the White Cart, here crossed by an old bridge of two arches, 2½ miles S.W. of Glasgow. It consists of one long irregular street, and other smaller ones. The town has recently been much improved, and many good houses have been built. The Established Church and the Free Church have each two places of worship, and the United Presbyterians, Original Seceders, and Roman Catholics have one each. Pollockshaws contains also an old town-house, a bank, and several schools. The prosperity of the town depends chiefly on the cotton-spinning which is carried on here, and in which most of the inhabitants are employed. Silk and cotton are woven by hand and power looms; and bleaching, dyeing, and calico-printing are carried on in the town. Coal mines are worked and stone is quarried in the vicinity of Pollockshaws. Pop. (1851) 6086.

POLLOK, Robert, the author of *The Course of Time*, was born at Moorhouse, in the parish of Eaglesham in Renfrewshire, in 1798, and received his elementary education at the school of Mearns. His characteristic love of learning displayed itself when he was still a rough rustic boy, hoeing and weeding in his father's fields. From that time it was his chief ambition to train himself for being a literary man, and especially a poet. While preparing for the university at the parish school of Fenwick, he gave his days and nights to the Latin language and to English poetry. While studying at Glasgow college, between 1817 and 1822, he kept the great authors ever standing as models before his mind's eye. His master-passion assumed a more decided form when he had taken the degree of Master of Arts, and had become a theological student in the United Secession Church. He then produced those stories which were afterwards published together under the title of *Tales of the Covenanters*, and set himself to evolve by degrees the ambitious plan of a great poem. At length, in July 1826, just when he was on the eve of taking license as a preacher, his *Course of Time*, a poem written in blank verse, and consisting of ten books, was completed. The circumstances attending this work's appearance before the public were very favourable. Blackwood the publisher, to whom it was first sent, submitted the manuscript to the perusal of Professor Wilson. That genial critic discovered its merit immediately, and recommended that it should be printed. Accordingly, the book was published in March

Pollux ‖ Polna.

1827, and was at once received as a poem of no ordinary merit. It is true that, to a discriminating eye, the design appeared unwieldy, the execution unequal, the images confused, indistinct, and distorted, and the diction frequently mere empty turgidity. Yet there were many qualities which secured the approbation of a wide circle of readers. Those who were fond of religious verse were delighted to find so much deep piety and orthodox sentiment joined with such a fresh and vigorous genius. Those who indulged in general literature admired the bold and striking imagination, the touches of tender feeling, and the signs of a strong crude power which the author everywhere displayed. The consequence was, that the edition was sold rapidly; the poem was favourably treated by the reviews; and the new poet was even placed by some thorough-going admirers on a level with Dante and Milton. It soon appeared that poor Pollok had purchased fame with his precious life. As his reputation began to increase, his body began to sink. In the course of a few months symptoms of consumption, the effect of his intense mental toil, became apparent. Several eminent and rich patrons rose up to assist him; but their assistance was too late. As a last resource, it was determined to send him to the mild climate of Italy; but his death-stricken frame could not be carried any farther than Southampton. There, on a September morning, six months after the publication of his great poem, he breathed his last; and there a granite obelisk erected over his grave, and bearing an inscription by the late Dr John Brown of Edinburgh, still tells of his untimely fate. The Life of Pollok, by his brother, appeared at Edinburgh in 1843. The twenty-first edition of his *Course of Time*, beautifully illustrated, was also published by Blackwood in 1857.

POLLUX. See DIOSCURI.

POLLUX, *Julius*, a Greek writer of antiquity, was born at Naucrates, a town in Egypt, and flourished in the reign of the Emperor Commodus, A.D. 183. He was educated under the Sophists, and made great progress in grammatical and critical learning. Having taught rhetoric at Athens, he became so famous that he was made preceptor of the Emperor Commodus. He drew up for the use of the latter, and inscribed to him, whilst his father Marcus Antoninus was living, an *Onomasticon*, or Greek vocabulary, which he divided into ten books. It is extant, and contains a vast variety of synonymous words and phrases, ranged under the general classes of things. It was intended to facilitate the knowledge of the Greek language to the young prince; and it is still very useful to all who have a mind to be perfect in that tongue. The first edition of the *Onomasticon* was printed at Venice by Aldus in 1502, and a Latin version was afterwards published along with it; but there was no correct and handsome edition of this work till that of Amsterdam, 1706, in folio, by Lederlinus and Hemsterhusius. Lederlinus went through the first seven books, and corrected the text and the version, subjoining his own along with the notes of Salmasius, Vossius, Valesius, Jungermann, and Kuhnius. This was followed by the edition of W. Dindorf, Leipsic, 5 vols. 8vo, containing the works of previous commentators. The last edition is that of Bekker, Berlin, 1846, which contains only the Greek text. Pollux wrote nine other works, none of which remains. He lived to the age of fifty-eight. Philostratus and Lucian have both treated him with much contempt and ridicule. (Philostrat. *de Vit. Sophist.*, lib. ii.; and Lucian *in Rhetorum Præceptore.*)

POLNA, a town of Bohemia, in the circle of Czaslau, not far from the Moravian frontier, 31 miles S.S.E. of Czaslau. It contains a church and a princely palace. The manufacture of cloth is carried on; this, together with agriculture and mining, occupying the most of the inhabitants. Pop. 6000.

Polo.

POLO, MARCO, a celebrated traveller, was the son of a Venetian merchant, and was born about 1250, at a time when his father was absent in the East. He was approaching the age of manhood when his parent, Niccolo Polo, and his uncle, Maffio Polo, returned to Venice in 1269 with a long account of their many travels and adventures. They had repaired, in pursuit of commerce, to Bolgar, on the Volga, the seat of the khan of the Western Tartars. A fierce war in the neighbourhood had cut off their return, and had left them no alternative but to travel round the northern shore of the Caspian Sea, and take refuge in Bokhara. After residing there for three years, they had been persuaded, in 1264, by a Persian ambassador to accompany him to Kemenfu in Chinese Tartary, the court of Kublai, the grand khan. Taking their lives in their hands, they had passed through severe snow-storms and over flooded rivers to their destination, a place that had never been visited before by any European. The great potentate had received them with condescension and affability, had shown a deep interest in the institutions of the western nations, and had sent them back to Europe on an embassy to the Pope. The brothers Polo now resolved to take young Marco with them on their return. Accordingly, in 1272, the three set out from Acre, bearing letters and presents from the newly-elected supreme pontiff, Gregory X. A journey of three years and a half, over toilsome deserts and through dangerous defiles, brought them to Tai-yuen-foo, the city where the grand khan was then holding his court. They were welcomed with the most distinguished honours, and were immediately raised to places of dignity and trust. Marco soon found himself in the most favourable circumstances for obtaining correct and extensive information regarding the land of his sojourn. The natives, gratified with the easy manner in which he assumed their language and manners, admitted him into their society, and treated him as one of themselves. The khan himself was constantly sending him on confidential missions to the most distant parts of the empire. The government of the city of Yang-tchoo-foo was even entrusted to him for the space of three years. At the same time, he was encouraged by his sovereign employer to take notes of everything that seemed rare or remarkable. Marco Polo had been employed in this manner for seventeen years, when he and his companions set their minds upon returning home. Kublai was at first unwilling to gratify their request. A circumstance, however, soon occurred which compelled him to yield. A Persian embassy, who were charged with conducting home a bride to their native prince from the court of the khan, found that they could not proceed by land, on account of the prevalence of hostilities along their route. At the same time, it was evident that they could not journey by sea, except under the guidance of those who were more skilful in navigation than the natives. There was therefore no resource but to allow the three Europeans to depart, in order that they might pilot the ambassadors as far as the Persian Gulf. Accordingly, in 1295, after an absence of twenty-four years, they arrived in Venice, complete foreigners in dress, appearance, and language, and without a single home-bred feature to recall them to the remembrance even of their nearest relations. Marco Polo, however, during the rest of his life, was treated with great honour and respect by all classes of people. Many of his fellow-citizens repaired to his house to drink in his wonderful stories about the grand khan and the far-distant Cathay. Still more went to pay court to the priceless wealth which he had brought home with him, and to bask in the delicious atmosphere of luxury which he had spread around him. No less consideration was paid to him when he had been taken prisoner in a sea-fight, and consigned to a prison in Genoa. It soon became fashionable among the Genoese to visit the cell of the far-travelled Venetian. So often was he called upon to tell his adventures that he grew tired, and resolved to recount them once for all in a written narrative. Rusticien de Pise, a well-known mediæval writer, was employed to put the facts into a legible form; and in 1298 the manuscript was circulated, to the great delight and satisfaction of the traveller's numerous admirers. At length, after a lapse of four years, the public interest in his welfare became so great that he was released, and sent home to his native Venice to live to a good old age.

During the three centuries after Marco Polo's death, his narrative continued to be very popular in different countries. In fact the translations into various languages became so numerous that there is a difficulty of determining what tongue is the original, and what text is the most correct. Yet it seems to be ascertained that the original language was French, and that the best edition is that in Italian, by Count Baldelli, in 4 vols. 4to, Florence, 1827. The latest English translation of the Travels of Marco Polo is that of Marsden, edited by Thomas Wright, Esq., and published in Bohn's "Antiquarian Library," London, 1854.

POLOTZK, a town of European Russia, in the government of Vitebsk, on both sides of the Polota, at its confluence with the Düna, 60 miles W.N.W. of Vitebsk. It is surrounded by fortifications, and has a ruined castle and numerous churches and convents. The most remarkable building is the college and beautiful church that formerly belonged to the Jesuits, but now to the Piarists. An active trade is carried on in flour, hemp, and other produce of the country; and annual markets are held, which are much frequented. Polotzk is a very ancient town; it existed as early as the time of Rurik, the founder of the Russian power. Battles were fought here in July and October 1812 between the French and the Russians. On the former occasion the French were successful, and took possession of the town; but on the 20th of October it was stormed and retaken by the Russians. Pop. (1851) 11,131.

POLTAVA, or PULTAVA, a government of European Russia, lying between N. Lat. 48. 48. and 51. 4., E. Long. 30. 25. and 36; bounded on the N. by the government of Tchenigov, E. by those of Kursk and Charkov, S. by those of Ekaterinoslav and Kherson, and W. by that of Kiev; length, from N.W. to S.E., 212 miles; greatest breadth, 145 miles; area, 19,059 square miles. The whole surface consists of an extensive plain, sloping gradually from the N.E. towards the Dnieper, which forms the S.W. boundary of the government. Along the banks of this and the other rivers, its tributaries, in the country, there are a few hills, but these are the only interruptions to the monotonous flatness which prevails throughout the country. The principal affluents of the Dnieper in the government are the Sula, Psiol, Vorskla, and Orel, all flowing from the N.W. The Dnieper is navigable all along the frontier of Poltava; and the Sula and Psiol are likewise navigable during the spring. The whole of the arable and meadow land is very rich and fertile. A small part of the country is occupied by forests; and a much larger portion consists of grass-covered steppes. The government contained in 1849, 5,397,198 acres of arable land; 3,279,915 of meadow land; 1,640,467 of wood; and 1,006,685 of waste land. The quantity of corn produced in the same year was 40,883,029 bushels, and of potatoes 2,842,535 bushels. There were at the same time in the government 173,352 horses, 661,061 horned cattle, 1,704,294 sheep, 410,050 swine, and 3702 goats. The kinds of grain principally raised here are rye, oats, barley, wheat, buckwheat, and millet. Tobacco, linseed, rapeseed, peas, and other vegetables are grown, as well as many kinds of fruit. Bees are kept in large numbers; many farmers have more than 100 hives; and the honey that is produced is of very excellent quality. Hares and partridges are numerous; and fish abound in the rivers. The climate is mild and healthy; but the cold in winter is sometimes severe when the north wind prevails. The only mineral productions are clay, lime, chalk, and saltpetre. Neither manufactures nor commerce are extensively carried on. There were, however, in 1849, 166 manufactories, employing 8014 hands. Among the former there were 55 of saltpetre, 24 of tallow and candles, 22 of tiles, 18 of cloth, 17 of sugar, and 9 of leather. The principal articles of export are corn and other rural produce, tallow, horses, cattle, wool, hemp, and flax. The majority of the inhabitants belong to the Greek Church; there are, however, 24,354 Jews, and a few Protestants and Roman Catholics in the country. Education is very much neglected, though nominally under the charge of the university of Charkov. There were in 1854, besides a gymnasium and other superior schools, 89 village schools, with 99 teachers, and 3643 scholars. Pop. (1851) 1,668,694.

POLTAVA, the capital of the above government, stands on a hill near the confluence of the rivers Poltawka and Vorskla, 445 miles S.S.W. of Moscow. It is walled, and defended by a castle in the centre occupying the summit of the hill. The streets are broad and straight, and the houses are for the most part of wood, though some of them are of stone or brick. Near the middle is the fine Alexander Square, with a granite monument to Peter the Great, commemorative of his victory at Poltava in 1709. Among the public institutions of the town are a cathedral and numerous other churches, a convent, several schools, a museum of industry, a lunatic asylum, and other benevolent establishments. In the vicinity there are large saltpetre works and extensive plantations of cherry trees. There are here also tanneries and distilleries. Some trade is carried on in the produce of the country with Turkey and Germany. The town was besieged by Charles XII. in 1709; but Peter the Great, advancing to raise the siege, totally defeated the Swedish monarch in the vicinity. This decisive battle forced Charles to take refuge in Turkey, and securely established the power of Russia. An obelisk has been erected on the field of battle, near which high mass is annually performed. Pop. (1851) 20,071.

PÖLTEN, ST (contracted for *St Hippolyt*), a town of Lower Austria, capital of the circle of Ober Wienerwalde, on the left bank of the Trasen, 35 miles W. of Vienna. It contains a splendid cathedral, an episcopal palace, several schools, an hospital for the deaf-and-dumb, a town-hall, theatre, and ball-room. In the principal square in the town stands a triangular column in honour of the Trinity (*Dreifaltigkeitssäule*). St Pölten has potteries, glass-works, cotton factories, and paper-mills. Pop. 5800.

POLYÆNUS, the name of many famous men recorded by the ancient writers. Amongst them was Julius Polyænus, of whom we have some Greek epigrams extant in the first book of the *Anthologia*. The Polyænus whom it most concerns us to know about is the author of the eight books of the *Stratagems of Illustrious Commanders in War*. He was probably a Macedonian, and perhaps a soldier in the early part of his life; but of this there is no certainty. He was undoubtedly a rhetorician and a pleader of causes; and, from the dedication of his work to the emperors Antoninus and Verus, he appears to have lived towards the latter part of the second century. The Στρατηγήματα were published in Greek by Isaac Casaubon, with notes, 1589, in 12mo; but no good edition of them appeared till that of Pancratius Maasirtius, Leyden, published in 1690, in 8vo. This work was translated into English by R. Shepherd, London, 1793.

We have in this work the various stratagems employed by above three hundred captains and generals of armies, chiefly Greeks and barbarians, for the Romans seldom resorted to such arts; and, besides, Polyænus has shown that he was little acquainted with Roman affairs. A great number of these stratagems appear to us to be ridiculous or impracticable; and neither the generals nor common soldiers of our day would be found simple enough to be caught by them. Few of the latter order indeed are capable of reading Polyænus' *Stratagems;* and if they were, they would reap but little benefit from the book. It is useful, however, to such as study the Greek language and antiquity; for many things will be found in it illustrative of the customs and opinions of ancient times. The sixth and seventh books are both imperfect. Polyænus composed several other works besides the *Stratagemata.* Stobœus has produced some passages out of a book *De Republica Macedonum;* and Suidas mentions a piece concerning the Thebans. If death had not prevented him, he would have written Memorabilia of the Emperors Antoninus and Verus, which he promised to undertake in the Preface to his sixth book of *Stratagems.* Casaubon, in the Dedication of Polyænus to Mornæus, calls him an elegant, acute, and learned writer.

POLYBIUS, a celebrated Greek historian, was the son of Lycortas, a native of Megalopolis in Arcadia, who succeeded Philopœmen in the chief direction of the Achæan League. His father, therefore, must have been one of the most distinguished men of his time; and we find him accordingly taking part in the principal transactions of his country. The exact date of his birth is unknown, but it is generally believed that it took place between 210 and 200 B.C.; and his death was therefore not earlier than 129 B.C., as he lived to the advanced age of eighty-two. Plutarch tells us that the character of Polybius was formed under the eye of Philopœmen; and that at the funeral of that general he carried the urn which contained his ashes, 182 B.C. The following year he was, along with his father and the son of the celebrated Aratus, appointed as ambassador to return thanks to Ptolemy Epiphanes for the assistance which he had offered to the Achæans; but the death of that prince took place before the ambassadors left the Peloponnesus. In the war which arose between the Romans and Perseus, King of Macedonia, the opinion of Polybius and his father Lycortas was, that the Achæans should observe a strict neutrality; but they were overruled, and the Achæans were implicated in the ruin of Perseus. To break the spirit of the Achæans, and to prevent any further attempts at insurrection, more than a thousand of the principal citizens were sent to Rome, and afterwards dispersed throughout the different cities of Italy. Polybius was one of these exiles; but he was so far favoured that he was allowed to remain in Rome, where he resided for sixteen years, from 167 to 151 B.C. He became the intimate friend and instructor of Scipio the younger, at that time only eighteen years old, and who afterwards showed how much benefit he had derived from the care Polybius bestowed on his education. At last, through the influence of Scipio and Cato, the Senate was prevailed on to allow the Achæan exiles to return to their country; but of the original thousand only three hundred survived to enjoy the permission thus granted to them. Polybius seems now to have employed his time chiefly in travelling, with the view of acquiring more accurate notions of geography. He examined with great care and minuteness the passes of the Alps, that he might be enabled to give a correct account of the passage of Hannibal. He afterwards visited Gaul, Spain, and Africa, to which latter country he accompanied Scipio, 146 B.C., when that general took and destroyed Carthage. But the calamities of his own unhappy country called him away, and he hurried to the Peloponnesus, where his presence, however, was unable to save Corinth from the fate which had overtaken Carthage. He did all in his power to prevail on his countrymen to submit to a fate which they only made worse by resistance; and the Roman deputies felt such reliance on his good intentions, that they appointed him to the office of judge in all disputes that might arise in any part of the Peloponnesus. He gradually acquired the esteem of his countrymen, and many of the cities of Greece erected statues to his honour. He subsequently extended his travels into Egypt, which he visited in the reign of Ptolemy Physcon. Whether he was present with Scipio at the siege of Numantia, B.C. 134, we are nowhere told; but he left behind him a work on the subject. He also wrote a biographical sketch of Philopœmen, a work on *Military Tactics,* and another on the *Equatorial Regions.*

His principal work, however, was entitled *General History,* though it referred more particularly to a space of fifty-three years (from 220 to 168 B.C.), from the commencement of the second Punic war, where the historian Timæus, and Aratus of Sicyon, had stopped, to the defeat of Perseus, King of Macedonia, by the Romans. It was divided into forty books, of which we now only possess the first five entire, and rather long fragments of most of the others. The first two books are occupied with introductory matter, giving a sketch of the events that happened anterior to the second Punic war. He explains the causes which gave rise to the first Punic war, and then relates the various events which took place during the twenty-four years it lasted. He gives also some account of the contest which arose between the Carthaginians and their stipendiaries. The second book contains the wars of the Æolians, Illyrians, Achæans, the expeditions of the Romans against the Illyrians and Gauls, and the transactions of Antigonus, King of Macedonia, and Cleomenes, King of Sparta, occupying a period of seventeen years, from 237 B.C. to 220. The third book enters into what is more properly the subject of his history, and, after explaining what he considers to be the true causes of the second Punic war, follows the path of Hannibal's victories as far as the battle of Cannæ, 216 B.C. Yet it would appear that he was defective in method, as the fourth book carries us back to anterior events, which had happened in 220, 219, 218 B.C. After a sketch of the people of the East during the reign of Philip, son of Demetrius, King of Macedonia, of Ariarathes, King of Cappadocia, of Antiochus, King of Syria, and Ptolemy Philopater, King of Egypt, this book traces the history of wars and seditions in Greece. In the fifth book we have the victories of Philip, the wars in Syria between Antiochus and Ptolemy, and the confederated arms of Greece turned against Rome. It would be useless to give any detailed account of the fragments of the thirty-five books that have been preserved; but we know that the thirty-ninth book ended with the destruction of Corinth, 146 B.C. There have been many editions of this work, but the most critical is that of J. Schweighäuser, 8 vols. 8vo, Leipsic, 1789–1795. The last edition is that of Immanuel Bekker, Berlin, 1844, 2 vols. 8vo. It has been translated into English by Hampton, 1772, 2 vols. 4to; into French by Thuillier, 7 vols., Par. 1759, with numerous plates and critical annotations; into German by Chr. Seybold, Lemgo, 1779–1783, and by L. Storch, Prenzl. 1828.

POLYCARP, one of the most ancient fathers of the Christian Church, was born towards the end of the reign of Nero, probably at Smyrna, where he was educated at the expense of Calista, a noble matron distinguished alike by her piety and charity. He was unquestionably a disciple of St John the Evangelist, and he conversed familiarly with others of the apostles. When of a proper age, Bucolus ordained him a deacon and a catechist of his church; and upon his death he succeeded Bucolus in the bishopric, to which he is said to have been consecrated by St John, who also directed his Apocalypse, amongst others, to him, under the title of "the angel of the church of Smyrna." When the controversy about the observation of Easter began to run high between the eastern and western churches, he went to Rome to discourse with those who were of the opposite party. The Roman see was then occupied by Anicetus, with whom he had many conferences, which were carried on in the most amicable manner; and though neither of them could bring the other to embrace his opinion, they both retained their own sentiments without violating that charity which is the great law of religion.

Whilst at Rome he particularly opposed the heresies of Marcion and Valentinus. His conduct on this occasion is related by Irenæus, who informs us that when Polycarp passed Marcion in the street without speaking, Marcion said, "Polycarp, own us;" to which he replied with indignation, "I own thee to be the first-born of Satan." Irenæus adds, that when any heretical doctrines were spoken in his presence, he would stop his ears, and say, "Good God, to what times hast thou reserved me, that I should hear such things," and immediately left the place. He was accustomed to mention that St John, going into a bath at Ephesus, and finding in it Cerinthus the heretic, immediately started back without bathing, crying out, "Let us run away, lest the bath should fall upon us whilst Cerinthus, the enemy of truth, is in it." Polycarp governed the church of Smyrna with apostolic purity till he suffered martyrdom in the seventh year of Marcus Aurelius. The manner of his death is thus related:—The persecution waxing hot at Smyrna, and many having sealed their faith with their blood, the general cry was, "Away with the impious; let Polycarp be sought for." Upon this he privately withdrew into a neighbouring village, where he continued for some time praying day and night for the peace of the church. He was thus employed when one night he fell into a trance, and dreamed that his pillow took fire and was burned to ashes. When he awoke he told his friends the circumstance, and pronounced it a presage that he should be burned alive for the cause of Christ. Three days afterwards, in order to escape the incessant search after him, he retired into another village. His enemies, however, were at hand, and having seized upon two youths, one of whom they forced by stripes to confess, they were by these lads conducted to his lodging. He might have saved himself by getting into another house; but he submitted, saying, "The will of the Lord be done." He therefore came down from his bed-chamber, and saluting his persecutors with a serene and cheerful countenance, he ordered a table to be set before them with provisions, invited them to partake, and only requested for himself one hour for prayer; after which he was set upon an ass, and conducted towards Smyrna. On the road he met Herod, a justice of the province, and his father, who were the principal instigators of the persecution. Herod took him up into his chariot, and strenuously endeavoured to undermine his constancy; but having failed in the attempt, he thrust him out of the chariot with so much violence and indignation, that his thigh was bruised by the fall. When at the place of execution, there came, as is said, a voice from heaven, saying, "Polycarp, be strong, and quit thyself like a man." When before the tribunal, he was urged to swear by the genius of Cæsar. "Repent," said the proconsul, "and say with us, take away the godless." Upon this the martyr, looking round at the crowd with a severe and angry countenance, beckoned with his hand, and looking up to heaven, said with a sigh, in a very different tone from what they expected, "Take away the godless." At last, having confessed himself to be a Christian, the crier thrice proclaimed his confession, and the people shouted, "This is the great doctor of Asia, and the father of the Christians; this is the destroyer of our gods, who teaches men not to do sacrifice to or worship the deities." When the fire was prepared, Polycarp requested not to be nailed, as usual, but only tied to the stake; and after a short prayer, which he pronounced with a clear and audible voice, the executioner blew up the fire, which increasing to a mighty flame, "Behold a wonder seen by us, who were purposely reserved," says the relator, "that we might declare it to others; the flames, disposing themselves into the resemblance of an arch, like the sails of a ship swelled with the wind, gently encircled the body of the martyr, who stood all the while in the midst, not like roasted flesh, but like the gold or silver purified in the furnace, his body sending forth a delightful fragrance, which, like frankincense or some other costly spices, presented itself to our senses. The infidels, exasperated by the miracle, commanded a spearman to run him through with a sword; which he had no sooner done, than such a vast quantity of blood flowed from the wound as extinguished the fire, and then a dove was seen to fly from the wound, which some suppose to have been his soul, clothed in a visible shape at the time of its departure." The Christians endeavoured to carry off his body entire, but were not allowed by the irenarch of justice, who commanded it to be burned to ashes. The bones, however, were gathered up, and decently interred by the Christians.

Thus died Polycarp, on the seventh of the kalends of May, in the year 167. The amphitheatre on which he suffered was mostly remaining not many years ago; and his tomb, which is in a little chapel in the side of a mountain, on the south-east of the city, was solemnly visited by the Greeks on the festival day; whilst, for maintaining and repairing it, travellers were wont to throw a few aspers into an earthen pot which stands there for the purpose. He wrote some homilies and epistles, which are now lost, except that to the Philippians, which is a truly pious and Christian production, containing short and useful precepts and rules of life, which Jerome informs us was even in his time read in the public assemblies of the Asiatic churches. It is singularly useful in proving the authenticity of the books of the New Testament; for he has cited several passages and expressions from St Matthew, St Luke, the Acts, St Paul's Epistles to the Philippians, Ephesians, Galatians, Corinthians, Romans, Thessalonians, Colossians, the first Epistle to Timothy, first Epistle of St John, and first Epistle of Peter; and makes particular mention of St Paul's Epistle to the Ephesians. Indeed the whole of this epistle consists of phrases and sentiments taken from the New Testament. (See Halloix, *Illustr. Eccles. Orient. Scriptorum Vitæ;* Cave, *Apostolici, or the Lives, &c., of the Primitive Fathers;* Tillemont, *Memoirs,* vol. ii.; Lardner, *Credibility,* part ii.; Neander, *Hist. of the Church,* vol. i.; Milman, *Hist. of Christianity,* b. ii., c. 7.)

POLYCLETUS, one of the most celebrated statuaries of the ancient world, was named of Sicyon, probably by birth, and of Argos, probably by citizenship. This celebrated sculptor, architect, and artist is said to have been the pupil of the great Argive statuary Ageladas, where he had Phidias and Migron for his fellow-disciples. Of his personal history nothing is known. As an artist he stood at the head of the schools of Argos and Sicyon; and he was judged to have surpassed his great Athenian rival Phidias on one occasion (if only on one)—the famous competition of the Amazons. The essential difference between these artists lay in this, that Phidias was unsurpassed in making the images of the gods, Polycletus in those of men.

The praises heaped upon Polycletus by ancient critics are numerous, and of the very highest order. Pliny has recorded of him that he brought the art of statuary to perfection, and Cicero supports the judgment. Dionysius of Halicarnassus, Quintilian, Lucian, and the poets of the Anthology, are all loud in his praise; while Xenophon, Plato, and Lysippus speak of him in terms implying an equality with Phidias. As a toreutic artist, Pliny believed him to have perfected the art which Phidias had begun. As an architect, Polycletus designed the theatre, and the circular building which he raised in the sacred inclosure of Æsculapius at Epidaurus. The former Pausanias thought the best worth seeing of all the theatres, whether of the Greeks or of the Romans.

The work which he probably designed to be the greatest of all his performances was his statue of Hera in ivory and gold, in her temple between Argos and Mycenæ. It was doubtless meant to rival Phidias's chryselephantine statues of Athena and Zeus, which, in the judgment of Strabo (viii., p. 372), it equalled in beauty, though surpassed by them in costliness and size. The goddess was seated on a throne, her head crowned with a garland, on which were worked the Graces and the Hours,—the one hand holding the symbolical pomegranate, the other a sceptre surmounted by a cuckoo. The lower part of the figure was robed from the waist downwards. In short, she was the white-armed goddess of Homer, with beautiful eyes, a splendid robe, a queen-like figure, and seated on a golden throne. (See an excellent essay on this statue by Böttiger, *Andentungen*, pp. 122–128.)

POLYCRATES, a Greek tyrant, was celebrated for the uninterrupted course of success which characterized his life. With the aid of no more than fifteen armed men he seized the sovereignty of Samos, and held it for some time in conjunction with his brothers Pantagnotus and Syloson. He then managed to get rid of the one brother by assassination and of the other by banishment, and to retain the entire power for himself. This was only the preparation for a more vigorous and efficient system of policy. The city was strengthened, 100 fifty-oared galleys were manned, and 1000 archers were enlisted. His fleet scoured the seas, sweeping before it all opposition, capturing many of the islands in the neighbourhood, and taking some of the cities in the mainland. In fact, so invariable was his good fortune that Amasis, King of Egypt, looking upon him as the future victim of the joy-avenging Nemesis, broke off an alliance which had subsisted for some time between the two kingdoms. Polycrates, however, although standing alone against his enemies, continued to be as successful as ever. In vain did some malcontents among his subjects attempt to raise a general revolt. Incarcerating the women and children of the city, he threatened to set fire to the former if any more should join the insurrection. In vain did the rebels, repulsed from the town, return banded with the Spartans and Corinthians. A beleaguerment of forty days ended only in complete failure. The Samian tyrant was fast increasing in power; and no enterprise now was a fitting object for his ambition but the conquest of Ionia and of the islands in the Ægean Sea. Yet just at this crisis the bright career of Polycrates was doomed to be suddenly extinguished in darkness. Oroetes, the satrap of Sardis, for some reason unknown, allured him over to Magnesia by the promise of a large sum of money. No sooner had he set foot within that city than he was seized and crucified in 522 B.C. (See Herodotus, iii. 39–47, 54–56, 120–125.)

POLYDORE, Virgil. See Virgil.

POLYGAMY, a plurality of wives or husbands in the possession of one man or woman at the same time. Polygamy has found favour in Asia from time immemorial, and the Mohammedans adopted and confirmed it. Montesquieu holds that it is owing to the greater number of female births in the East; but this is by no means proved. Another more plausible reason may be found in the premature old age of the female sex in these countries. Niebuhr, in his *Travels in Arabia*, gives a curious piece of conversation which he had with an Arab on polygamy. Selden, in his *Uxor Hebraica*, has shown that a plurality of wives was allowed among the Hebrews. It has to be noticed, however, that polygamy was not countenanced by the Greeks or Romans. It is remarked by Tacitus in his *Germania*, that the Germans "alone, among all the barbarians, are content with a single wife." Bernardus Ochinus, general of the Order of the Capuchins, and afterwards a Protestant, published, about the middle of the sixteenth century, *Dialogues in favour of Polygamy*, which were replied to by Beza. About the close of the seventeenth century an artful treatise on polygamy was published at London by John Lyser, under the title *Polygamia Triumphatrix*, and assigned to "Theophilus Aletheus," which has been replied to by several writers. Bruce has introduced the argument, that in some parts of the world the proportion of female children is much superior to that of the male; and the Rev. W. Madan, in his *Thelyphthora*, has come forward more boldly in favour of polygamy than any other modern writer. In Christianity, polygamy receives no countenance; and in Christian countries it has been long since forbidden.

POLYGLOT, or Polyglott (πολὺς, *many*, γλῶττα, *a tongue*), a word generally applied to Bibles printed with the text represented in various languages. The idea of a Polyglot seems first to have occurred practically to Origen in the third century, who spent much time in forming the Old Testament into such a work. This is commonly known as the *Biblia Hexapla*, or the Bible in six columns, of which various imitations have been published since the invention of printing. The fragments of Origen which remain were published by Montfaucon, in 2 vols., Paris, 1714, under the title of *Hexaplorum Origenis quæ supersunt.* The principal Polyglots printed since the time of Origen are:—1. *The Complutensian Polyglot*, named from *Complutum*, the Latin name of Alcala de Henares in Spain. It was printed under the superintendence of Cardinal Ximenes in 1502-17, in four languages, comprehending 6 vols. folio. 2. *The Antwerp Polyglot*, printed by Christopher Plantin, under the editorship of Arias Montanus, and with the sanction of Philip II. of Spain. It was published at Antwerp in 8 folio vols., 1569–72. 3. *The Parisian Polyglot*, printed at Paris by Antony Vitre, and edited by Guido Michael Le Jay, 1628–45, 10 vols. folio. This splendid performance, besides containing all that is in the former two polyglots, has the addition of an Arabic version of the Old and New Testaments, a Syriac version of the Old Testament, and the Samaritan Pentateuch. 4. *The London Polyglot* was edited by Brian Walton, in 6 vols. folio. It was published between 1654–57. It consists occasionally of nine languages,—namely, Hebrew, Chaldee, Samaritan, Syriac, Arabic, Persian, Ethiopian, Greek, and Latin. Dr Edmund Castell, one of Walton's assistants, afterwards published a *Lexicon Heptaglotton*, 2 vols. folio, 1669, with grammars of all the languages prefixed. This work is by no means equal in appearance to the foregoing; but for solid usefulness it is greatly their superior. Its history is recorded at length in Archdeacon Todd's *Memoir of the Life and Writings of the Right Rev. Brian Walton, D.D., Lord Bishop of Chester*, 2 vols. 8vo, London, 1821. 5. *Bagster's Polyglot* was published by Bagster the bookseller in 1 vol. folio, London, 1831. The Old Testament is in eight languages and the New in nine,—viz., Hebrew, Greek, English, Latin, German, Italian, French, Spanish, and Syriac, the New Testament being given in the last language by way of appendix. Prefixed to the work are fifty pages of prolegomena in Latin, by Professor Lee of Cambridge. The entire volume presents a very attractive appearance. (On the entire subject of Polyglots the reader may consult Horne's *Introduction*, Butler's *Horæ Biblicæ*, and Clarke's *Bibliographical Dictionary*.)

POLYGNOTUS, a famous painter of Thasos, flourished about 422 years before the Christian era, and was the son and scholar of Aglaophon. He adorned one of the public porticos of Athens with his paintings, in which he had represented the most striking events of the Trojan war. The Athenians were so pleased with him that they offered to reward his labours with whatever he pleased to accept, but he declined the offer; and the Amphictyonic Council, which was composed of the representatives of the principal cities of Greece, ordered that Polygnotus should be maintained at the public expense wherever he went. Of the talents of

Polygnotus much honourable mention is made by many of the best authors of antiquity,—as Aristotle and Plutarch, Dionysius of Halicarnassus, Pliny, and others. Pausanias speaks of his pictures of the events of the Trojan war, and in his tenth book introduces a long description of other pictures by the same artist, painted also from Homer, in the temple at Delphi. The passage, however, gives but a confused and imperfect idea of the painter's performance. How much the art is indebted to this ancient master, what grace and softness he gave to the human countenance, what embellishments he added to the female figure and dress, are much more happily described by Pliny.

POLYGON (πολύς, *many*, γωνία, *an angle*), according to Euclid, is any plane rectilineal figure having more than four sides or angles; but geometers generally treat of the triangle and the quadrangle under polygons.

POLYHEDRON (πολύς, *many*, ἕδρα, *a seat*), in Solid Geometry, denotes a solid bounded by many faces or planes. When all the faces are regular the solid becomes a regular body.

POLYHISTOR, the surname of Alexander Cornelius, a native of Ephesus, or, according to some, of Cotyacum. The first part of his career was attended with misfortune. Enrolled in the forces of Mithridates the Great, he was taken prisoner in Greece by the army of Sylla, and was exposed for sale as a slave. Cornelius Lentulus bought him, and taking him to Rome, employed him as a *pædagogus*. In course of time, however, fortune began to smile upon the enslaved Alexander. His master liberated him; and Sylla is said to have bestowed upon him the Roman franchise. His varied and extensive learning, and the many miscellaneous works which he produced, secured for him the surname of *Polyhistor*, and introduced him to the notice of patrons. He was living in easy circumstances at his villa at Laurentum when he perished in a fire which consumed his household effects. A list of the works of Polyhistor is given in *De Historicis Græcis* of Vossius. But a part of a History of Judæa, found in Eusebius, and a few fragments of a History of Rome preserved in Servius, are the only remnants of his great and multifarious erudition.

POLYHYMNIA (Πολύμνια, contr. for Πολυΰμνια, *i.e., She of the many dreams*), one of the nine Muses. She was the goddess sometimes of the higher lyric poetry, sometimes of eloquence.

> "Nec Polyhymnia
> Lesboum refugit tendere barbiton." (Hor., *Od.* i. 1, 33.)

POLYNESIA.

Character- stic dis- inction.

POLYNESIA is a name given by several early writers on geography, but first, we believe, by De Barros, to the numerous islands scattered over the Pacific Ocean, or, as it was usually called, the Great South Sea. Modern writers have also given the name of *Micronesia* to the small chains or clusters of islands scattered over that part of the Pacific lying to the E. and S. of the Sandwich Islands, and to the N. of the equator, but this region may still be reckoned part of Polynesia, the name which is now applied by modern geographers to the *sixth* great division of the earth's surface. This division will probably appear on examination less arbitrary than some others; for whether we consider it in a political, physical, or moral point of view, the separation from America on the one hand, and from Australasia and the Asiatic islands on the other, is marked by very strong and distinct features. A considerable portion of the last, for instance, have ages ago been invaded and taken possession of by foreigners, and several parts of Australasia have more recently been colonized by Europeans. No colonies have yet been planted in Polynesia, with the exception of that on one of the Ladrone Islands by Spain, and the recent military occupation under the protectorate of France at Tahiti. Since the commencement of the present century, however, many of these islands have been visited by European missionaries, for the purpose of spreading amongst the natives the light of the gospel; and in most cases their efforts have been so far successful that they have established permanent settlements in these islands, and have instructed the natives, not only in the doctrines of the Christian religion, but in many useful mechanical arts and other improvements of civilized society. The inhabitants, excepting those of Tahiti with France, have no political connection with any of the other divisions of the earth, and but little exists between any two of its groups or separate islands, each being governed by its own chiefs, and confining its friendships or hostilities to some neighbouring group or island.

ysically nsidere

All geographical divisions are to a certain degree arbitrary; but if the islands south of the equator, and eastward from New Holland as far as the New Hebrides and New Zealand, be considered as included in Australasia, the boundary of Polynesia, physically considered, is almost as distinct as its political seclusion. If a line be drawn in a south-easterly direction along the eastern extremity of the Philippine Islands, Mindanao, Papua or New Guinea, New Ireland, and Solomon's Archipelago, and from thence continued southerly along the eastern shores of the New Hebrides and New Zealand, this line will mark with sufficient precision the separation of the Asiatic islands (mostly to the northward of the equator), and Australasia (to the southward of the equator) from Polynesia. The geological structure of the islands which constitute the first-mentioned divisions is also, generally speaking, essentially different, consisting chiefly of lofty mountains of primary or secondary formation, partaking of the same structure as those on the continent of Asia, with which some of them, indeed, may probably have once been connected, their rugged sides presenting as it were a broken barrier to the great Pacific; whereas Polynesia exhibits over a large part of its surface a series of low, flat islands, scarcely rising above the level of the sea, which, with the exception of the lofty groups of volcanic formation, are the labours of minute sea animals, and are usually distinguished by the name of *lagoon* or *coral* islands.

Morally considered.

In a moral point of view, the distinctive character of the Polynesians is as strongly marked as the physical structure of the islands which they inhabit. In the Eastern Archipelago, or the Asiatic islands, and in Australasia, two distinct races of men have been traced,—the *black* and the *brown*. In the archipelago, and more particularly in the Philippine Islands, a few individual families of the Negro race were discovered by the early European visitors; in New Guinea and the Papuan Islands the whole population appears to consist of this race. They differ in some respects from the Negroes of the western coast of Africa, resembling rather those which are found on the eastern coast, particularly in the hair, which is strongly twisted into small tufts, and very different from that of the Negro of Guinea.

Natives of Polynesia.

The only Negroes that have been discovered on any of the islands of Polynesia are the Fijians, who are of the same race as the inhabitants of that part of Australasia which some modern writers have called *Melanesia*, all the other inhabitants being of the *brown* race, and by some supposed to be derived from the same common stock to which the Tartars, the Chinese, the Japanese, and the Malays, owe their origin. In this opinion Sir William Jones, Dr Buchanan, Mr Marsden, and Sir Stamford Raffles to some extent concur. To whatever source the whole of these races may be traced, the Malays and the Polynesians present so many points of resemblance as to lead to the conclusion that they have been derived from the same parent stock. The several portions of this race which inhabit the different groups of the Pacific exhibit considerable variety in figure and colour; but are generally rather above the middle stature,[1] with frames well knit and robust. Their limbs are muscular and firm; their hands and feet small; their heads not unduly large nor disproportioned; the face sometimes exhibiting in a slight degree the triangular form of the Tartar races, though as frequently oval, occasionally with broad and well-shaped foreheads; the eyes black, not large, but placed horizontally, with somewhat straight and well-defined eyebrows. The nose is frequently small and broad, but occasionally aquiline and well formed, with nostrils open. The mouth is usually large, and the lower lip projecting; the teeth regular, perfectly white, and well set; and the hair is often coarse, black, and straight or curling. The chin is seldom projecting; but in some tribes the jaw is large, and broad at its junction below the ear, which produces a peculiar fulness, as seen in New Zealand and the Sandwich Islands.

Language.

Dispersed as the Polynesians are, and rarely and purely accidental as any communication between distant islands must be, there is strong evidence that the different dialects spoken, from the shores of India and Africa to those of America, are the derivatives of one common language, which, according to Marsden, still forms the primitive portion of the Malay language, mixed as it now is with Sanscrit and Arabic.

Although the dialects of Polynesia and Australasia bear some resemblance to each other, the resemblance is not so close as that which prevails between those of the former and the Asiatic Archipelago and Madagascar, which seem to have belonged to one language, designated by Marsden the Polynesian. The Asiatic source of the language is supposed to be indicated by the presence of Sanscrit words in all. Considering the state of civilization in which the people have been found, their language is remarkably comprehensive, clear, and exact, especially in its grammatical structure; and so philosophical as to convey the impression that it must have descended from a people possessing a higher degree of civilization than those by whom it is now spoken. The vowel sounds predominate; and the peculiarity in the Polynesian language, which expresses almost every syllable by a single vowel, or a consonant and vowel, and invariably terminates every word with a vowel, renders it, when spoken, remarkably euphonic, flowing, and easy. The softness of the language is also increased by the rejection, throughout all the dialects, with the exception of that spoken by the Samoans and Fijians, of all sibilants and sounds produced by double consonants.

Religion.

Not less remarkable is the general accordance of the Polynesians in manners, superstitions, and religious observances. The conversion of the Malays of the archipelago to Mohammedanism has nearly obliterated their ancient faith, but enough still remains on some of the Asiatic islands, and still more on the Asiatic continent, to trace the source whence the Polynesians have derived many of their religious opinions and practices.

General view of the islands.

These preliminary observations on the physical form, features, language, and religion of the Polynesians, are made with a view to indicate their common origin, and may be taken as a general description of the natives of the various groups of islands which are scattered over the surface of the vast Pacific Ocean. But though the language and mythological legends of the brown-complexioned and straight-haired races inhabiting Eastern Polynesia may be traced to the Asiatic archipelago, information has lately been collected among the Melanesians, or woolly-haired race inhabiting the Fijis and the islands of Australasia, from which it appears that their language bears a resemblance to some of the languages spoken in the interior of Southern Africa. It is worthy of notice also, that if the religion of the Polynesians was derived from Asia, it does not seem to have been limited to the islands of the vast area over which it has been spread; and without entering into a comparison of the mythology of the aboriginal inhabitants of South America, it is a singular fact, that massive relics met with in Polynesia, some evidently of high antiquity, and almost Cyclopean in their dimensions and structure, the ruins of their ancient temples and fortresses, bear a remarkable resemblance in form and size to the extensive pyramidal structures composed of successive terraces, and other buildings, found amongst the Peruvians by the discoverers of America.

The chief characteristic of the religion of the Polynesians seems to be a sort of hero-worship, their principal gods having been renowned men who still exercise an influence over the affairs of this world, appearing in the form of some living creature, through the medium of which they exert their power. With this is associated throughout the islands a firm belief in spirits or demons, and in sorcery.

The groups of Polynesia are exceedingly different in their extent, both as to number and size, as well as in their composition. Sometimes single islands are met with, surrounded by extensive reefs. These islands and reefs are dispersed, as already observed, over the whole of the Pacific Ocean, but chiefly between the thirtieth degree of northern and the thirtieth degree of southern latitude. The following classification will be found to embrace the greater part of those islands which are comprehended under the geographical division "Polynesia":—

Classifica tion of th islands.

In the Northern Hemisphere.—1. The Marian or Ladrone Islands; 2. The Carolinas, including the Pellew Islands; 3. The Marshall's Islands, and the Kingsmill group; 4. The Sandwich Islands; 5. The numerous reefs and coral islands scattered over the Northern Pacific, and designated Micronesia.

In the Southern Hemisphere.—1. The Fijis; 2. The Friendly Islands, including the group of the Tonga Islands; 3. The Navigators' Islands; 4. The Society Islands; 5. The Georgian Islands, including Tahiti and the Austral Islands; 6. The Marquesas; 7. Easter Island; 8. Pitcairn's Island; 9. The Mangareva Group; 10. The Paumotus, or Dangerous Archipelago.

IN THE NORTHERN HEMISPHERE.

Ladrones.

The *Ladrone Islands* were first discovered by Magelhaens on the 6th of March 1521. This name, by which they are generally known, was given to them by the Spaniards on account of the thievish disposition of the natives; and afterwards, when missionaries were first sent thither in 1668, under the patronage of Mary-Anne of Austria, queen of Philip, they took the name of Las Marianas, in honour of that lady. (See LADRONE ISLANDS.)

The expedition of Loyosa touched at the Ladrone Islands in 1526, and were received in the most friendly manner by the natives. They found no quadrupeds on the island, but plenty of excellent fruits, fish, and rice. The only birds were turtle-doves, of which the islanders appeared to be so fond that they kept them in cages, and taught them to speak. In 1565 the Ladrone Islands were again visited by Lopez de Legaspe, and, notwithstanding his anxiety to prevent quarrels, skirmishes took place, and one of the seamen who had strolled into the woods being found murdered, the Spaniards landed in force, set fire to their houses and canoes, wounded several of the natives, and hung upon the spot three wounded prisoners.

---

[1] The measurement of eleven natives of ten different races in Polynesia were taken during the progress of the United States exploring expedition under Commodore Wilkes in 1840: only one was so low as 5 feet 2 inches; one was 6 feet 10 inches; but the average was 5 feet 10 inches.

Visited by Cavendish; by Olivier Van Noort; by Spilbergen and the Nassau fleet.

In 1588 our countryman Cavendish came in sight of the Ladrones, and sailed along the coast of Guahan, from which a number of canoes came off with fruits and vegetables, which were exchanged for pieces of iron; but the natives became so troublesome that, in order to get rid of them, Cavendish ordered muskets to be fired at them. In 1600 Olivier Van Noort made the Ladrone Islands, and stopped near Guahan for two days, from which island above 200 canoes came off to the ships with fish, fruits, and rice to exchange for iron: fowls are mentioned, for the first time, in this voyage. In 1616 Spilbergen made the Ladrone Islands, and stopped two days to traffic with the natives for provisions of fruit, fowls, and fish, in exchange for bits of iron. In 1625 the fleet under Prince Maurice of Nassau refreshed at Guahan, and were supplied by 150 canoes, with immense quantities of cocoa-nuts, yams, bananas, rice, and fowls, which were of great service, as the scurvy had made such havoc among the crews that in some of the ships they had scarcely strength enough to manage the sails.

Of the Spanish Jesuits.

In the year 1668 the Spaniards established a mission on the island Guahan, consisting of P. Servitores and five other fathers, with several lay assistants, most of them natives of the Philippine Islands, and well acquainted with the Tagul language, the same as that spoken by the natives of the Ladrone Islands. For some time the chiefs of the islands behaved with great kindness to the Jesuits, and gave them ground for building a church. From this seat of the mission the fathers spread themselves amongst the other islands, where they were received with equal kindness. In short, P. Servitores says, that in the first year they had baptized more than 13,000 islanders, and instructed 20,000, in the eleven islands which they had visited. The imprudent zeal, however, of the missionaries ruined their cause by shocking the prejudices of the natives. These simple people took it into their heads that, as an infant had died shortly after being baptized, its death had been occasioned by that ceremony; and such was the terror of mothers on seeing a missionary approach, that they seized their children and ran off with them into the woods. This opinion gathered ground from the eagerness of the Jesuits to get hold of infants for the purpose of baptizing them, and more than one of these holy fathers fell martyrs to their imprudent zeal. Several murders ensued; and as the Spaniards had taken care to strengthen the mission with a body of troops well armed, with the obvious intention of taking possession of the Ladrones as an important outpost to the Philippine Islands, after a great number of the natives had been put to death, the rest submitted to the yoke of the Spaniards; though most of the missionaries suffered in the contest, and last of all Servitores, who was killed by the man to whom he had been the greatest benefactor, because the missionary insisted on baptizing his child. Thus, at the age of forty-five, this pious and good man, for such he appears to have been, fell by the hand of an assassin, after having, as we are told, "established the faith in thirteen islands, founded eight churches, established three seminaries for the instruction of youth, and baptized nearly 50,000 of the islanders." From this time constant revolts and massacres ensued, and the most inhuman cruelties were inflicted on the unhappy islanders; so that in 1681 the island of Guahan, which, on the first landing of the Spaniards, counted 40,000 inhabitants (some accounts make them more), had become so completely depopulated that it was found necessary to bring inhabitants from the northern islands to cultivate the soil.

Visited by he buca- ieers;

In the year 1685 the ship of John Eaton, the bucaneer, touched at Guahan, the crew of which quarrelled with the natives, and killed some of them. Having satisfied the Spanish governor that it was done in their own defence, "he gave us toleration," says Cowley in his narrative, "to kill them all if we could." . . . . "We took four of these infidels prisoners," continues the narrator, "and brought them on board, binding their hands behind them; but they had not been long there when three of them leaped overboard into the sea, swimming away from the ship with their hands tied behind them."

y Dam- ier;

In 1686 Dampier touched at Guahan, and states the number of natives not to exceed 100. He gives a particular description of their "flying proas," with their outriggers, which, he says, "sail the best of any boats in the world; adding that he tried the swiftness of one by his log, and that she ran 12 knots out before the half-minute glass was half out." "I believe," says Dampier, "she would run 24 miles an hour." Woodes Rogers, who visited the Ladrones in 1710, states it as his opinion that one of these proas would sail at the rate of 20 miles an hour.

y Anson.

In the month of August 1742, Commodore Anson anchored before the island of Tinian. It was deserted; but cattle to the number of at least 10,000, besides hogs and fowls, were running about wild. Cocoa-nuts in innummerable quantities, bread-fruit, oranges, limes, water-melons, and other tropical fruits, were in the greatest abundance. Though now deserted, Tinian, on the arrival of the Spaniards, is said to have contained 30,000 inhabitants. Ruins of buildings, consisting of pyramidal pillars of considerable dimensions, were met with in all parts of the island.

Visited by Byron;

Commodore Byron anchored in the year 1765 before Tinian, and found the island overgrown with large trees and underwood, amongst which were most of the tropical fruits.

by Kotzebue.

Lieutenant Kotzebue visited Guahan in 1817. No canoes nor proas, nor happy islanders, greeted his approach; the whole race of natives had long been extirpated. "We looked," he says, "in vain for a canoe or a man on the shore; and it almost seemed as if we were off an uninhabited island. The sight of this lovely country deeply affected me. Formerly these fertile valleys were the abode of a nation who passed their days in tranquil happiness; now only the beautiful palm groves remained to overshadow their graves; a deathlike silence everywhere prevailed." Soon, however, a person appeared from the Spanish governor, and piloted the ship into the harbour: and after this Kotzebue proceeded to the town of Agana, situated upon a beautiful plain some hundred paces from the shore, in the midst of fine palm groves, some of the houses being built of coral rock, others of bamboo. It had a church and a convent, and two fortresses,—one to protect the town from the seawards, and the other to keep the Indians in awe. The town contained about 200 houses and 1500 inhabitants, who derived their origin from Mexico and the Philippines. The population of the island is about 5000 souls. "There is but one man and his wife," says Kotzebue, "on the whole island of the original stock; with the death of these two people the race of the old Ladrones will be totally extinguished." "The present race," says Chamisso, "no longer know the sea, are no mariners, no swimmers; they have ceased to build boats. They now scarcely hollow out, without skill, the trunks of trees to fish within the breakers." All the other islands to the north of Guahan are entirely uninhabited, and overrun with wild cattle, hogs, and goats, which afford a supply to the American vessels trading to the Sandwich Islands and the N.W. coast of America. Indeed it was said that some of these people had been allowed to settle themselves in Agrigan, on condition of acknowledging their allegiance to Spain, and that they were peopling the island with natives kidnapped from the Sandwich Islands.

Carolinas.

The Carolinas, or Caroline Islands.—In 1686 a Spanish ship, being near the meridian of the Ladrones, fell in with an island, which her commander, Don Francisco Lazeano, named *La Carolina*, in honour of the King of Spain, Carlos II. This island has given the name to a very extensive chain spreading over a space of not less than 6 degrees of latitude and 25 degrees of longitude, the western extremity being the group of the Palaos or Pellew Islands, in Lat. 7. N., Long. 135. E.; and the easternmost island, that of Hogolen, in Lat. 9. N., Long. 155. E. The whole group, as far as is known, which however is very imperfectly, consists of at least 150 separate islands, besides various coral reefs with islets upon them. Yet, numerous as they are, being somewhat out of the direct and usual route of the Spaniards in their voyages from South America to the Philippines, they had the good fortune to escape any intimate connection with them,—a connection which has proved equally baneful to others, whether established by the cross or the sword, by their professions of friendship or avowals of hostility.

Some of these islands, and especially those towards the western extremity of the group, had been seen by various navigators long before that of Carolina was noticed and named by Lazeano. The Portuguese, Da Rocha, fell in with islands in 9. or 10. N. Lat. in 1526, which he named Sequeira, after his pilot; and in 1628 Saavedra, a Spaniard, in his passage to the Philippines, discovered islands in Lat. 11., which he named Los Reyes. In 1579, our countryman Drake saw some islands to which he gave the name of the Islands of Thieves, and which, from his description, have been supposed to be the Pellew Islands. In 1595 one of the islands, in about 6. N., was seen by Mendana; but two proas full of people, driven by the violence of the wind from a group of islands in the east as far as Samal, roused the attention of the College of Jesuits at Manilla, who made several unsuccessful attempts to establish missions on those islands, which the wrecked natives described to be thirty-two in number. In the year 1710 the two fathers, Duberron and Cortel, embarked in the San Trinidad with a crew of eighty-six men, to establish themselves on the Pellew Islands. They landed on Sonsorol, with the quartermaster and ensign of the troops, in all sixteen persons; but the ship was driven off by the current, and what became of the missionaries was never ascertained.

In the *Lettres Edifiantes et Curieuses* is a letter and chart from P. Juan Antonio Cantova, a missionary at Guahan, addressed to the King of Spain's confessor in 1722, in which is given a more particular account of the Carolinas than any which had been published.

English and American vessels, chiefly whalers, have for several years past resorted in great numbers to the Caroline Islands for water and refreshments, ten or twelve ships arriving, and two or three hundred sailors being on shore amongst the natives, at one island during a single season. Several white men, generally runaway sailors, also reside on the islands thus visited, and keep what are called accommodation-houses for the use of the officers and crews of vessels resorting to the shores. The effect of the large influx of foreigners of this class has been disastrous to the natives, who have learned to make and use intoxicating drink to such an extent that the drunkenness, debauchery, and disease attendant upon such practices are rapidly destroying the population. Within the last few years a small number of self-denying American missionaries with their wives, accompanied by some Christian natives of the Sandwich Islands, have established themselves on Ponape or Ascension Island, and Ualau or Strong's Island, two of the largest of the Caroline Islands. They have met with much discouragement from the influence of the heathen priests, the open hostility of the white men, and the recklessness and apathy of the people, as they see their race, under the destructive influence of vice and disease, rapidly melting away. In 1854 the smallpox appeared with frightful virulence among the people, and being ascribed to the prayers of the missionaries, exposed them to peril, while it deterred the natives for a time from submitting to vaccination or other means of preservation, which the medical missionary and his companions were anxious to apply. So fearful were the ravages of this visitation, that in the course of a few months more than half the entire number of one of the tribes on Ascension Island died. The safety of those who submitted to vaccination ultimately produced a re-action in favour of the missionaries, who still remain to continue their praiseworthy efforts.

Marshall's Islands.

To the N.E. of the Carolines is a large cluster of low coralline islands, discovered by Marshall and Gilbert in 1788, the northern portion being usually called Marshall's, and those to the south Gilbert's Islands. This cluster extends from 160. to 172. E. Long., and from 4. 35. to 12. N. Lat. These islands range, in two lines or chains running north and south, parallel to each other, and 60 or 100 miles apart. The western chain is called the Radick, and the eastern the Ralick chain, each comprising fifteen or sixteen islands, of which the chief part are said to be under the government of one chief. Milé or Mulgrave Island consists of twenty-four or thirty islets connected by a reef of coral, and inclosing a lagoon 12 or 15 miles across. The islets are each from half a mile to 6 miles in length, and about half a mile wide. Nearly all the islands are of similar formation. In some the soil, though scanty, supports vegetation, and bread-fruit and cocoa-nut trees, with a few bananas, are found there. The inhabitants are a finer race than the natives of the adjacent islands, having sharper features, long and curling hair, and more athletic frames. They accomplish long voyages in canoes made of bread-fruit planks. The men are partially clothed, and the women wear fine, beautifully-made mats, reaching from the waist to the feet. They are fond of ornaments. The lobe of their ears is pierced, and the aperture extended, by means of a pandanus leaf rolled up, until a man can pass his arm through it. These islanders have not had much intercourse with foreigners. During one of the early visits of shipping to their shores, a theft having been committed, a general attack was made upon the people, and many killed. Amongst these was the brother of the king, who, himself being wounded, was determined upon revenge. No white men reside upon the islands; but they have been visited by American missionaries, with a view to the ultimate conversion of the natives to Christianity.

The Kingsmill group.

These islands, sixteen in number, lie chiefly to the northward of the equator, though some are in the Southern Hemisphere. Hurd's Island is in 3. S. Lat., and the group extends to Makin, in 3. 20. N. They reach from 172. 57. to 176. E. Long. All are low coral islands, the highest land in the group being about 20 feet above the sea. Drummond's Island, one of the largest of the group, is said to be about 40 miles long, and less than half a mile wide. Several are 20 miles long, while few are more than half a mile across. There is usually a reef at some distance from the island, uniting the extremities of the island and inclosing a lagoon. Water is obtained by digging through the coral sand, but is brackish to the taste. The shallow soil is composed of coral sand and vegetable mould. Vegetation is scanty; but the bread-fruit, cocoa-nut, and a species of arum or taro, are cultivated with great care. The islands are populous. The natives, a fine race of people, bear a stronger resemblance to the Malays than many farther west. Their colour is darker than that of the Tahitians, and their faces exhibit great variety of form and expression. They have black glossy hair. Their features, according to the testimony of Commodore Wilkes, are small, but high and well marked; their eyes are large, black, and bright; nose straight or slightly aquiline, and rather wide at the base; mouth large, with moustache and slender beard, full lips, and small teeth. Both sexes are but slightly clothed,—the men wearing a girdle and a mat over the shoulder, the women a girdle of split leaves reaching to the knees. The women are guarded with great jealousy, separate houses being erected for their abode; and any man besides the husband or some near relative entering the house set apart for the woman, would be put to death or reduced to slavery. Wars appear to be frequent; and the natives use spears, with prongs at the point, armed with rows of sharks' teeth. They also manufacture a sort of defensive armour made of the twisted or braided fibre of the cocoa-nut husk, matted together about half an inch in thickness, so as to cover the limbs. Their helmets are made of the skin of the porcupine fish. The women go out to war as well as the men. Whales abound in the neighbourhood, and are occasionally stranded on the reefs or sandbanks among the islands. Excepting at one of the islands, there has been but little intercourse with shipping, but where this has taken place it has not improved the condition of the people. They manufacture a considerable quantity of cocoa-nut oil. In 1855 an American medical missionary, Dr Pierson, spent about six weeks amongst these islands. He reports them healthy, and estimates the population of the group at from 30,000 to 35,000.

Besides the clusters already noticed, there are numerous single islands, mostly of coral formation, spread over that portion of the Pacific designated Micronesia, which extends from 3. S. to 21. N. Lat., from 130. to 180. E. Long., and is estimated to contain a population of 200,000.

Sandwich Islands.

This fine group of islands in the northern Pacific had the good fortune to escape the visits of the old navigators, and the discovery of them was reserved for Captain Cook, who first touched at them in the year 1778. This distinguished navigator was received by all classes of the people with the liveliest demonstrations of astonishment and delight. Offerings and prayers in homage were presented to him by their priest in one of the temples near the bay in which his vessels anchored, and on the shore of which he subsequently fell by the dagger of a native in the year 1779. His bones were afterwards preserved by the priests, and continued to receive offerings and homage from the people until 1819, when the whole system of idolatry was abolished. A rude monument (the stump of a cocoa-nut) inscribed with his name, was the only memorial by which his countrymen have marked the spot where he fell. The name by which this group of islands is known was given by Captain Cook in honour of the Earl of Sandwich, first lord of the Admiralty at the time of their discovery.

The group consists of ten islands. The following table (from the *Polynesian*,[1] July 6, 1844) gives the extent and population of these islands. The population was supposed by their discoverers to amount, in 1779, to 400,000:—

Islands.	Length.	Breadth.	Square Miles.	Population as estimated in 1825.	Censns of 1832.	Census of 1836.
Hawaii	88	73	4000	85,000	45,792	39,364
Maui	48	30	620	20,000	35,062	24,199
Lanai	17	19	100	2,500	1,600	1.200
Molokai	40	7	190	3,500	6,000	6,000
Kahoolawe.	11	8	60	50	80	80
Oahu	46	25	530	20,000	29,755	27,809
Kauai	22	24	500	10,000	10,977	8,934
Niihau	20	7	90	1,000	1,047	993
Total...	292	193	6090	142,050	130,213	108,579

These islands are situated between Lat. 18. 54. and 22. 2. N., and between Long. 155. and 161. W. Hawaii, the largest, rises majestically in grand unbroken lines from the ocean, crowned with three massive mountain peaks, on two of which the snow lies for the greater part of the year. They are as follows:—

Mouna Roa (Long or High Mountain)...height 13,760 feet.
Mouna Kea (White Mountain) .... „ 13,953 „
Mouna Huararai (1687 toises) .... „ 11,067 „

The first two of these measurements are given by Commodore Wilkes, of the U.S. exploring expedition, and the latter by Kotzebue.

The whole group is of volcanic origin, and the entire substance of the islands is basalt or lava. Extensive craters crown the summits of the loftiest mountains, and amongst these the largest is Kirauea, on the east side of Hawaii, and about 4000 feet above the sea. This immense volcano, one of the largest yet discovered, was unknown to the civilized world until it was visited in 1823 by a party of missionaries, three Americans and one Englishman, of whose explorations an account was afterwards published. (*Tour through Hawaii*, by Rev. Wm. Ellis, author of *Polynesian Researches.*) At an elevation of 4000 feet above the level of the sea these travellers found, in the midst of a plain many miles in circumference, and 300 feet below the summits of the walls of volcanic rock around, a vast oval crater 9 miles in circumference, with perpendicular sides 1000 feet deep, covered at the bottom with a lake of liquid lava, at one end red and boiling. Around the edge, or from the midst of this fiery lake, fifty-one conical craters sent forth jets of lava or smoke and flame. From the ledge projecting round the crater, 300 or 400 feet above the burning mass, it appeared as if the lava had recently risen to this height in the vast furnace, and had then flowed out through a subterranean channel towards the sea, where some miles of the coast had been filled up with liquid lava not many weeks before. Immense banks of finely-crystallized sulphur, as well as smaller craters, were discovered in the vicinity. Two years afterwards this wonder of the Pacific was visited by Captain Lord Byron and the officers of H.M.S. Blonde, and in the year 1840 by the commander and a number of officers of the United States exploring expedition. The volcanoes had continued in action during the intervening time; but the scientific measurements of the crater taken on these occasions differed only slightly from those first published by the missionaries. Eruptions occur at intervals in other parts of the island; and in 1843 two new craters opened on the summit of Mouna Roa, 13,000 feet above the sea, from which, during six or eight weeks, the burning lava poured forth, forming three rivers 5 or 6 miles in width, and extending between 20 and 30 miles towards the sea. These eruptions being accompanied by earthquakes, and sometimes fearful thunderstorms, present at such seasons spectacles of the most sublime and awful grandeur. Nor have the spectacles of human action and feeling connected with these appalling convulsions of nature been less affecting; as when, after offerings and prayers had failed to appease the imagined anger of the gods, the sovereign, attended by the priests and followed by his people, has moved in solemn procession to the edge of the flowing lava, and there, as the costliest offering they could present, the priests have cut off part of the hair of the sovereign, by them considered sacred, and cast it into the fiery stream, whose progress was afterwards stayed. The last and the most appalling eruption which has taken place within the memory of the oldest inhabitants, commenced in August 1855, when a crater opened near the summit of Mouna Roa, and for the next ten months continued to pour forth burning lava, which formed a stream 70 miles in length, from 1 to 5 miles wide, and from 10 to several hundred feet in depth.[1]

---

[1] A newspaper belonging to the Sandwich Island government.

Although entirely volcanic, the shores of these islands are protected by coral reefs, and each island possesses several harbours, some of them spacious and secure, as Hilo, or Byron's Bay, on the east, and Kealake'kua, on the west side of Hawaii; Lahaina in Maui; and Honolulu in Oahu. This last is generally considered the best in the islands, and is the resort of the greatest number of vessels. All the islands are mountainous, and great part of their surface is lava in various stages of decomposition, often sterile; but where the lava is ancient and disintegrated, covered with forests or inferior verdure; while the plains and valleys are often exceedingly fertile. 500,000 acres are supposed to be suitable for tillage, and half of this for the production of sugar. All the islands, with the exception of some parts of Hawaii, are well watered. The chief indigenous productions used as food are cocoa-nuts, bananas, bread-fruit, sugar-cane, yams, arrow-root, and several varieties of esculent arum (taro), which is extensively and carefully cultivated, and forms the chief support of the natives. To these may be added the *Convolvulus battatus* (sweet potato), which is grown in considerable quantities. The island also produces the paper mulberry and the kava plant. The forests abound with large and valuable timber, chiefly hard and durable. Sandal-wood was formerly exported in large quantities, but is now exhausted. Many valuable fruits and vegetables, as well as grain, have been introduced, and appear to thrive well. Amongst the most important of these are grapes, oranges, coffee, pine-apples, and melons. Pumpkins, Irish potatoes, cabbages, maize, and wheat are amongst the most useful vegetables; and grain.

The climate, considering that the islands are within the tropics, is remarkably healthy, being generally dry, and the temperature varying with the elevation. The following are the results of a meteorological table for one year, kept on the western shore of Oahu:—Greatest heat, 88°; least heat, 61°; range, 27°; general range, 70° to 80°; mean temp., 75°; general course of wind, N.E.

The only animals found by Captain Cook in the islands were hogs, dogs, and rats. Captain Vancouver, some years afterwards, left there a breed of cattle, which resorted to the mountains in the interior, where they soon became numerous. The natives used to shoot them, or take them by digging pits near pools of water. It was in one of these pits that Mr Douglas, an intelligent and indefatigable botanist from the Horticultural Society in England, suffered a frightful death. He was found there gored to death by a bull, which also was found in the same pit. These cattle were some years ago more numerous than at present; a number of Spaniards having come over from California, with horses trained for the service, to hunt them, chiefly for the sake of their hides. It is said that as many as 5000 hides were exported in one year, which induced the government to prohibit the shooting of these animals, otherwise they would soon have been exterminated. (Wilkes' *Exploring Expedition*, vol. iv., p. 203.) Tame cattle, horses, mules, goats, have since been introduced, as well as poultry.

The inhabitants of these islands are, considered physically, amongst the finest races in the Pacific, bearing the strongest resemblance to the New Zealanders in stature, and in their well-developed muscular limbs. The tatooing on their bodies is less artistic than that of the New Zealanders, and much more limited than among some of the other islanders. They are also more hardy and industrious than those living nearer the equator. This in all probability arises from their salubrious climate, and the comparative sterility of their soil, rendering them dependent upon the cultivation of the ground for the yam, the arum, and the sweet potato, their chief articles of food. The language of the two races is also so nearly allied, that although occupying the most remote regions north and south at which any of their race have been found, they have little difficulty in understanding each other.

Though, like all undisciplined races, the Sandwich islanders have proved deficient in firm and steady perseverance, they manifest considerable intellectual capability. Their moral character, when first visited by Europeans, was not superior to that of other islanders; and excepting when improved and preserved by the influences of Christianity, it has suffered much from the vices of intemperance and licentiousness introduced by foreigners. Polygamy prevailed among the chiefs and rulers, and women were subject to all the humiliations of the tabu system, which subjected them to many privations, and kept them socially in a condition of inferiority to the other sex. Infanticide was practised to some extent, the children destroyed being chiefly females. Though less superstitious than the Tahitians, the idolatry of the Sandwich islanders was evidently ancient. It was equally barbarous and sanguinary, as in addition to the chief objects of worship included in the mythology of the other islands, the supernatural beings supposed to reside in the volcanoes, and direct the action of subterranean fires, rendered the gods of the Sandwich islands objects of peculiar terror. Human sacrifices were slain on several occasions, and vast offerings presented to the spirits supposed to preside over the volcanoes, especially during the periods of actual eruptions.

The requisitions of their idolatry were severe, and its rites cruel and bloody. Grotesque and repulsive wooden figures, animals, and the bones of chiefs, were the objects of worship. Human sacrifices were offered whenever a temple was to be dedicated, or a chief was sick, or a war was to be undertaken; and these occasions were frequent. The apprehensions of the people with regard to a future state were undefined, but fearful. The lower orders expected to be slowly devoured by evil spirits, or to dwell with the gods in burning mountains. The several trades, such as that of the fisherman, the tiller of the ground, and the builder of canoes and houses, had each their presiding deities. Household gods were also kept, which the natives worshipped in their habitations. One merciful provision, however, had existed from time immemorial, and that was sacred inclosures, places of refuge into which those who fled in time of war, or from any violent pursuer, might enter and be safe. To violate the sanctity of the Marai was one of the greatest crimes of which a man could be guilty. Campbell was present at the execution of a man who had committed this offence, in getting drunk and running into the Marai during *tabu*. He was taken to the Marai, where his eyes were put out; in this state he remained two days, when he was strangled, and his body exposed before the image of the Atua, or idol.

The Sandwich Islands, although the last important discovery in the Pacific, have, in consequence of their geographical position, been more frequently visited by Europeans, and have advanced in civilization more rapidly, than any of the other islands, presenting, at the present time, a degree of improvement unsurpassed, if equalled, during a corresponding period in any other part of the world. The first movement in this direction was made by the chief who governed the large island of Hawaii, after the death of the king who ruled at the time of Captain Cook's visit. This prince,

---

[1] Letter from Mr Coan to General Miller, in *Journal of Geological Society*, 1856.

Tamehamaha, the founder of a new dynasty, and sometimes compared to Peter the Great, was a chief of quick perception and great force of character. The Sandwich islanders are necessarily a nautical people, and their king was one of the first to perceive the immense superiority of European vessels over the native canoes. When Captain Vancouver visited these islands in 1792, the king being desirous of having a vessel of European construction, this able navigator laid down the keel of one, which was speedily finished. Ten or twelve years after this, when Mr Turnbull visited the islands, the king had a naval force of twenty vessels or upwards, of from twenty-five to fifty tons, which traded amongst the islands. To these he subsequently added others, purchased at enormous prices from foreigners visiting the islands. Bent not only on the improvement of his own island, but the subjugation of others, the king encouraged a warlike spirit in the people, introduced European arms among his soldiers, and by means of his infant navy, and the superior weapons of his troops, conquered, though not without great destruction of life, one island after another, until he became undisputed sovereign of the whole group. He also encouraged trade with foreigners, and derived from its profits a large increase of his revenue, as well as the means of consolidating his power. This energetic and successful ruler died in 1819, leaving his kingdom to his son, a mild and good-natured prince, kindly disposed towards the people, but destitute of the energy of his father, which was in a great measure supplied by Karaimoku, one of his councillors, who became prime minister of the young king, and was called by the people "the iron cable of the country." One of the first acts of the young king was to abolish the tabu throughout the islands. He was induced to adopt this policy from various causes; namely, a desire to improve the condition of his wives, who were subject, along with all other females, to the operation of the tabu; *secondly*, several foreigners and intelligent chiefs advised the change; and the report of what had been done by Pomare, King of Tahiti, had great weight with him. Some disturbances took place in consequence of the abolition of idolatry; but the insurgents were defeated, and peace was restored. which has since been but slightly disturbed by the natives themselves.

In the year 1820 a number of well-qualified missionaries arrived from America, and after some difficulty arising from the misrepresentation of foreigners, were allowed to land, and commence their labours at Honolulu, in the island of Oahu. A short time afterwards the present of a small schooner from the British government to the king afforded an opportunity for Mr Ellis, an English missionary, and a number of Christian natives from the Society Islands, to visit Oahu. These native Christians disabused the minds of the king and chiefs of the erroneous opinions they had been induced to entertain as to the objects of the foreign teachers; while Mr Ellis, who had been a number of years in the southern islands, finding the language nearly the same, was able to assist the American missionaries in reducing the Hawaiian language to writing, in preparing books, teaching the natives to read and write, and in preaching the gospel to them in their own language.

In the year 1824 the King and Queen of the Sandwich Islands embarked, amidst the sighs and tears of their subjects, on a voyage to Great Britain, where they died the same year. Their bodies, with their surviving attendants, were brought back to the Sandwich Islands, in the Blonde frigate, under the command of Lord Byron. Kauikeoli, the brother of the king, was unanimously acknowledged as his successor, under whose protection the missionaries continued their labours, often under great discouragements, in establishing schools, planting churches, and training native teachers and missionaries. Amongst those who paid attention to the instruction of the missionaries, numbers made an open profession of Christian faith; and a stricter morality prevailed. They became more humane, more industrious and honest. The Christian females adopted a dress after the European fashion, and became examples of domestic virtue.

The introduction of letters, the reception of the Christian faith, and the guarantee thus afforded for the security of commerce, constituted an era which may be regarded as the turning-point in the history of this people. From that time they have continued steadily to advance in intelligence, resources, civilization, and religion. Their progress has been at times painfully interrupted by means of the misrepresentations of the representatives of foreign governments, and the conduct of foreign officers. On one occasion an English officer went so far as to take possession of the island, and establish a commission for its government; and French officers abrogated the laws, dictated treaties, and by force of arms established the Roman Catholic religion in the country. The act of the English officer was disallowed by his superior as soon as known; but these acts of violence led to a representation on the part of the native sovereign to the governments of England, France, Belgium, and America, and by these powers the independence of the Sandwich Islands was guaranteed in the year 1844.

The Hawaiian government has since been regularly organized; its several departments are efficiently administered, and its laws obeyed throughout the islands. Most of the principal offices of government are filled by foreigners, chiefly Americans, who have become Hawaiian subjects.

The present condition of the islands is shown by the following financial statement for the two years ending March 31, 1858:—

Cash in treasury, April 1, 1856	L.5,853
Receipts for two years ending March 31, 1858	133,134
Total	L.138,987
Expenditures same period	138,914
Balance in treasury, March 31, 1858	L.73
The liabilities of the treasury, March 31, 1858	L.12,641
The assets of the treasury, March 31, 1858	1,521
Balance	L.11,120

Since their independence has been secure, the progress of the people has been uninterrupted; and the resources of the island have been greatly augmented by the discovery of gold in California, which, lying within a short distance, has increased the trade, opened important markets for produce, and raised the value of labour throughout the islands.

The material prosperity of the people is remarkable. Houses are built in European forms and of durable materials; good roads connect the different parts of several of the islands; a large portion of the inhabitants are well clothed, and are possessors of money, or herds, or plantations; and numbers of foreigners, chiefly American and English, have settled in the islands either for purposes of commerce or as permanent residents. Of these there are about 500 at Honolulu in Oahu, and perhaps an equal number in other islands. Improved and productive agriculture, introduced by foreigners, has been adopted by the natives; and besides the ordinary indigenous productions, wheat and other grain is raised, and converted into flour. Horned cattle are numerous. Extensive plantations of coffee and sugar yield a good return for the capital invested, and reward the skill and labour employed. A sort of national agricultural society exists; and the government has encouraged agriculture, especially the culture of sugar-cane, by the award of premiums or the remission of taxes to the most successful native cultivators.

The cultivation of cane for the manufacture of sugar was commenced in Oahu in 1825, when about 100 acres were planted. This attempt was not successful. Ten years later, sugar-planting was commenced on Tauai, and subsequently on the other islands of the group. There are five different varieties of cane indigenous to the islands, three of which yield a good return. Besides a number of small plantations, which have not been found remunerative, there are five of considerable size on the islands, one of which, on Hawaii, conducted by Chinese, yields 100 tons per annum; while the total produce of sugar in the islands at the present time is about 800 tons, of which one-third is consumed in the islands.

Besides sugar, corn is raised, and flour produced; while large numbers of cattle are reared for the purpose of furnishing fresh meat, or salt beef for exportation. A large fleet of coasting vessels bring the greater part of the produce of the islands to Honolulu in Oahu, the chief port in the islands; and 2000 barrels of domestic salt beef, and 3000 barrels of flour, equal to any imported, and large quantities of firewood, potatoes, pumpkins, vegetables, and fruits of all kinds, are annually furnished at this port to merchant and whaling ships; while native as well as foreign seamen may usually be obtained in this port at short notice. Less than forty years ago there was only one house built after the European model. The walls and thatch of the others were chiefly of native grass, and simple barter was the only species of commerce. Now the population of this town averages about 9000.

There are four ship-chandlery stores, about twenty importing houses, and from fifty to sixty retail stores; twelve hotels, nine or ten physicians, and five printing-offices. There are six churches, some of them very substantial specimens of architecture, and capable of accommodating each from 300 to 3000 persons. The schools are numerous both for the native and foreign children, and it is generally thought, by those most capable of judging, that the advantages afforded in Honolulu for a thorough education are equal to those of New England, excepting only her universities and colleges. (Hunt's *Merchant's Mag.*, Feb. 1858.)

To the other channels of productive enterprise and skill has recently been added that of whaling. The whaling fleet of the Sandwich Islands now numbers fifteen vessels. The proximity of the islands to the whaling grounds, and other facilities, promise to render this a profitable investment of capital, while it will increase the market for the native products which its prosecution requires.

The commerce of these islands has been far more rapid and astonishing than even the material improvement in the circumstances of the people. Ever since the discovery of the sperm whale in the northern parts of the Pacific, the captains of numerous vessels engaged in the whale fishery have resorted annually to these islands to refit their ships, recruit their crews, and procure refreshments. The geographical position of the islands has also rendered them the natural point of junction for the commerce between South America, India, and China. The discovery of gold in California has greatly increased this commerce; and the advantages which the position, the resources, and the security afforded by the consolidation of the government in the hands of one sovereign, have rendered these islands a centre of commerce between regions far more remote than the borders of the Pacific. The increase and present magnitude of that commerce will appear from the following tables, which contain a detailed statement of the several classes of imports at Honolulu in 1857, and were prepared by the collector-general of customs in the Sandwich Islands:—

Value of Goods Imported from

United States, Atlantic side	L.55,381
„ Pacific „	55,986
Great Britain	41,322
Vancouver's Island	899
Australia	1,992
Bremen	12,958
Hamburg	1,173
Society Islands	3,217
Sea, &c.	4,300
China (Hong Kong)	4,454
Japan	223
Total	L.181,905

Imports Free of Duty by

Returned cargoes	L.3,659
Whalers	2,292
Missions	897
Charitable societies	332
Agriculturists	768
Rifle company	557
H.M.'s chamberlain	244
Fire department	111
Diplomatic agents	73
Total	L.8,933

Goods and Spirits Bonded, from

United States, Atlantic side	L.22,354
„ Pacific „	5,471
Great Britain, &c.	3,089
China (Hong Kong)	49
Sea	4,196
Society Islands	553
Bremen	1,139
Hamburg	251
Total	L.37,102

Aggregate value of imports at Honolulu in 1857, L.227,943. The values imported at the other ports were,—*free*, at Lahaina, L.2108; at Hilo, L.652; at Kawaihae, L.323; at Kealakeakua, L.116: and *dutiable*, at Lahaina, L.2136; at Hilo, L.163; at Koloa, L.11: aggregate at these ports, L.750. Making the total value of imports at the Sandwich Islands, L.235,448. (Hunt's *Merchant's Mag.*)

In the midst of this external and material progress, the continued decrease of the native population is a source of depressing anxiety to the government and the best friends of the people; for notwithstanding the improved habits of many, the better food, better clothing, improved dwellings of multitudes of the people, their numbers are diminishing. The number of deaths every year is still in excess of the births to an extent far beyond what the epidemics which have at times visited the islands can be supposed to have produced; and a large number of the married couples are childless. In the year 1857 the deaths in the islands were 2017, the births only 1615; but this excess of deaths was moderate compared with many past years. Various causes are assigned for this wasting away of the people. Some consider it caused in part by the less active occupations of the women, and the different modes of life which the progress of civilization has produced, especially as the decrease has been greatest in those parts where foreigners are most numerous, and the changes have been greatest; others ascribe it to the effects of maladies of foreign origin, and to habits of licentiousness and intemperance. But by whatever cause, or combination of causes, it has been produced, it casts a mournful shadow over the future of the Hawaiian race.

The only relief to the gloom which this fact produces arises from the progress of education and religion throughout the islands. The commencement of missionary operations in 1820 has been already noticed; these efforts have been continued, progressively augmented, and spread over the whole group. The American Board of Foreign Missions, who have carried forward this work, have devoted to it a number of labourers and an amount of means unsurpassed in any other missionary field of equally limited extent; and the results have been corresponding. Every vestige of idolatry has long since disappeared. Education has been diffused so extensively, that a child of suitable age who cannot read is rarely seen; while many can write a good hand, and are acquainted with arithmetic. Besides the common native schools, 300 in number, containing nearly 9000 scholars, three high schools, for imparting more extensive instruction, have been established, and have sent into the community 500 or 600 better educated young men. There have been between 10 and 20 schools for teaching English, as well as a royal school for educating the sons of the chiefs; and now a college is established, to enable the youth of the islands to receive a solid education sufficient to qualify them, without leaving the country, to carry forward the processes of civilization, as well as to discharge all the duties which the nation may require. These educational efforts are sustained by the native government. The first missionaries carried out a printing-press. Others have been added; and the efforts of the press have kept pace with the advance of education. There are now a number of presses; and besides school-books and other works connected with education and religion, there are several newspapers regularly published in English, and one or more in Hawaiian; and one, the *Polynesian*, in English, is the paper of the government. The total number of pages printed since the commencement by the presses connected with the missionaries exceeds 196 millions. These educational efforts have been considered subsidiary to the great work of the missionary, the preaching of the gospel and the conversion of the people, and in this they have been eminently successful. Congregations of professed Christians have been gathered in most of the principal districts, and in many parts substantial churches have been built for the worship of God; while numerous communities of men and women have been united in Christian fellowship, and are living exemplars of the excellence and power of the gospel of Christ. Besides the difficulties naturally arising from the wickedness of the human heart, impediments to the religious progress of the people have arisen from the influence of Popery and the examples of Mormonism; but religious improvement among the people has continued to advance, and the numbers in church fellowship throughout the islands amount to about 22,000, and the Christian portion of the people raise annually for religious objects about 23,000 dollars. Notwithstanding all the defections from the integrity and purity required and maintained in the Christian communities, this proportion of nearly one-fifth of the entire population being members of the church exhibits a state of society truly encouraging.

To these islands the American society has, since 1820, sent out 145 labourers, of whom 42 were ministers, 7 physicians, 20 lay assistants, and 76 females. Upwards of 20 ministers, and a proportionate number of schoolmasters and assistants, including 40 native teachers, are now in the islands, supported in part from America, but chiefly by the government or people.

SOUTHERN HEMISPHERE.

The Fiji Islands.

The Fiji Islands.—Regarding the New Hebrides as the eastern limit of Australia, the Fijis constitute the western boundary of Polynesia. By French writers these islands are included in the regions to the west, to which the name of *Melanesia* has been given; but as this term designates rather the colour of the people than the peculiarities of their country, it does not necessarily define geographical boundaries; and, as ethnologically considered, the Fijis seem to form the connecting-link between the black races of Melanesia and the lighter-coloured brown races of Polynesia, and exhibit some fusion of Polynesian race and language, they may not inappropriately be classed with the latter.

This extensive group of islands, lying between 15. 30. and 20. 30. S. Lat., and between 177. E. and 178. W. Long., and comprising 225 islands and islets, about eighty of which are inhabited, was first seen by Tasman in 1643, and named by him *Prince William's Islands.* Captain Bligh, after the mutiny in the Bounty, passed amongst the south-western portion of the group in 1789. Captain Wilson, in the ship Duff, after leaving the first missionaries at Tahiti and Tongatabu, got entangled amongst these islands in the eastern part of the group in 1797. Early in the present century a sort of piratical or bucaneering trade in sandalwood was commenced in the Fijis and western islands. The sandalwood was taken to China by vessels from New South Wales. In 1804 a number of convicts, escaped from New South Wales, reached these islands, and settled chiefly on two of them, by the chiefs of which they were treated with great consideration, in consequence of the aid which they rendered with their firearms in times of war. They were men of desperate character, and depraved and barbarous habits; and while the islands derived a degree of supremacy from the aid thus rendered in war by these foreigners, their reckless waste of human life increased rather than restrained the barbarity of the natives.

M. d'Urville visited the islands in 1827; and in 1840 they were regularly surveyed by the United States exploring expedition under Commodore Wilkes. These islands are of varied size, two of them being from two to six miles in circumference, apparently coral formations covered with deep vegetable soil. The others are of volcanic formation, the highest mountains on the Viti Leva (Great Fiji) rising perhaps 5000 feet above the sea. Their forms are exceedingly varied, and often remarkably beautiful; the soil generally fertile, and in the parts where rain is most frequent the verdure is rich and constant. Vanua Leva, one of the largest islands, is 100 miles long and 25 miles wide; and Viti Leva is 90 miles from east to west, and 50 miles from north to south. The islands are entirely or partially protected by reefs, and most of them have lagoons of considerable extent. The numerous reefs and islets, together with the force of the currents, render navigation intricate, at times perilous; and, together with the supposed invincible ferocity of the natives, have caused them to be less visited than other islands of the same great ocean.

The temperature of the Fijis, though warm, is not insalubrious. The vegetable productions used as food are more numerous than in many of the other islands, as, besides the bread-fruit, cocoa-nut, banana, sugar-cane, taro or arum, yams, sweet potatoes, arrowroot, and dracœna, there are several others which the natives use for food. The population of the islands is estimated at 150,000. As in other parts of this region, the population of this group appears to have diminished one-third within the last 50 years, and in "some districts as much as one-half." (*Fiji and the Fijians*, by Thomas Williams, vol. i., pp. 102, 103.) Judging from their descendants, they must have been a fine race of men. They are usually taller than Europeans; men about 6 feet in height are frequently seen. They are often well-formed and muscular, but not corpulent, having broad chests and strong sinewy limbs. Their hair is abundant, long, black, and frizzled or bushy, with whiskers and a thick large beard. The outline of the face is a good oval, the nose well shaped, with full nostrils, yet distinct from the Negro type. The colour varies, but the pure Fijian seems to be between the black races of the West and the brown or olive-coloured races of the East. "The chiefs, as in several other groups, are incontestibly much finer-looking than the common people, their features having much less of the Negro cast, and their foreheads—partly, perhaps, on account of the form and height of their head-dresses—appearing loftier and more expansive. I did not perceive that, in general, the colour of their skins was lighter; although at Bua I noticed that the older men were in many instances of a deeper black than the younger ones." (Erskine's *Cruise among the Islands of the Western Pacific*, p. 240.)

The Fijians appear to have been regarded, from the period of our earliest acquaintance with them, as in some respects more advanced than the neighbouring tribes. In the volume containing Captain Wilson's voyage in the Duff it is stated :—"The Friendly islanders regarded the people of Fiji as superior to themselves, both in military prowess and in mechanical ingenuity,—their weapons and clothing being wrought in a more masterly style, and some manufactures, especially that of earthen vessels, being carried on at Fiji which are not attempted at Tongataboo." (*Missionary Voyage of the Ship Duff*, p. lxxi.) The Fijians seem to be the only inhabitants of Polynesia who practise the manufacture of pottery to any extent, and evince in the form and ornamentation of their vessels artistic taste and skill. Great ingenuity is also manifested in their mats and clothing, in their ear-rings and other ornaments, as well as in their articles of dress and arms. Indeed, their dress altogether might not inappropriately be described as a species of ornament, neither their climate nor their general habits requiring that it should be used for purposes of comfort or convenience. That of the men consists chiefly of a kind of figured sash, sometimes extending in length to 100 yards, though 6 or 10 yards is the usual measure. This is wound round the body so as to fall over the knees like a curtain, and is then fastened behind, or left to trail upon the ground. The women are not allowed to use the same material; but they also emulate the train by allowing a sash of inferior quality to sweep the ground behind. A white turban, consisting of a kind of gauze-like scarf of extremely fine material, is worn by all the Fijians who have any claim to this badge of respectability; and this head-dress is rendered peculiarly ornamental by the taste with which it is adjusted,—sometimes being tied with a knot in front, or at the top of the head, while portions of the scarf are allowed to float on either side or down the back. Upon this part of the person especially is the taste of the Fijians displayed. Their hair is naturally strong and abundant; but the different modes in which it is arranged by artificial means, and the patience with which the chiefs especially submit to the operations of the hair-dresser, are truly astonishing, the result being, to produce a roundness and softness of surface almost geometrical in the exactness of its outline.

The following description is given by Captain Erskine of a distinguished chief of one of these islands :—"The chief himself, the most powerful perhaps of any in the Pacific, and certainly the most energetic in character, was seen seated in the attitude of respect to receive us. He rose, however, as we entered, seeing that it was expected, unfolding, as he did so, an immense train of white native cloth 8 or 10 yards long from his waist, and invited me to occupy the one chair he possessed, the others taking their seats on rolls of cloth, or, like the natives, sitting cross-legged on the floor. It was impossible not to admire the appearance of the chief: of large, almost gigantic size, his limbs were beautifully formed and proportioned; his countenance, with far less of the Negro cast than among the lower orders, agreeable and intelligent; while his immense head of hair, covered and concealed with gauze, smoke dried, and slightly tinged with brown, gave him altogether the appearance of an eastern sultan. No garments confined his magnificent chest and neck, or concealed the natural colour of the skin, a clear but decided black; and in spite of this paucity of attire—the evident wealth which surrounded him showing that it was a matter of choice, not of necessity—he looked 'every inch a king.'" (Erskine's *Voyage*, p. 186.)

In the structure of their dwellings the Fijians also evince considerable skill. Their houses are compact and durable; and their double canoes are among the finest and fleetest in the Pacific. The Fijians are exceedingly superstitious, the priests exercising great power over the lives and property of the people. They have no idols,—*i.e.*, they worship no images or other material representations of their gods. Their term for divinity, *kolan*, is also applied to anything great or wonderful, good or bad; but they reverence certain stones as shrines of their gods, regard some weapons with superstitious feelings; while certain birds, fish, plants, and even men, are supposed to have gods residing in or connected with them. Their chief god is an impersonation of their idea of ceaseless existence. Others of the higher order are supposed to be also eternal, and to exercise influence over the elements of nature, the islands, or their inhabitants. The gods of the lower class are the spirits of deified men. Each island has its own god; each locality its own superstitions. Nearly every chief has a god in whom he places especial confidence; and some are of opinion that their god follows them wherever they go. Different classes, as the carpenters, fishermen, &c., have their respective gods. Nearly every house or village has its own *bure*,[1] or temple, some more than one. These are constructed with great care, highly ornamented, and generally raised on an artificial mound, sometimes 20 feet high. Several spears set in the ground, and some blanched human skulls, are fixed in the sacred place; offerings of weapons decorate the interior; while a long piece of white cloth, used as a girdle or sash, fixed to the top, and carried along the rafter and corner-post to the ground, forms the path down which the god is supposed to descend to enter the priest. The priests are at times also doctors, and in these cases a number of the articles presented, or the fees, are deposited in the temple. This building is also used as a council-chamber or town-hall, as well as a place of entertainment for strangers and sleeping place for the chief personages of the village. The homage and offerings appear to be provided by appeals to the fears of the people. Offerings are presented when the favour or aid of the god is required, or it is wished to ascertain his will; and the priest, pretending to be filled by the god, exhibits phrenzied and convulsive action, and in incoherent utterances delivers the response of the oracle. Upon his uttering the word "I depart," or flinging himself violently down and beating the ground, a shell is then blown or a musket fired to announce that the god has departed. A good understanding mostly exists between the chief and the priest, and the revelations from the latter generally accord with the wishes of the former. On one occasion, when a priest ventured to utter an inspiration contrary to the wishes of the chief, the latter silenced the priest by exclaiming, "Who are you? Who is your god? If you make a stir, I will eat you." (*Fiji and the Fijians*, vol. i., p. 227.) And this the priest knew well was no idle threat.

---

[1] *Bure* is the word for prayer or worship in the dialects of Eastern Polynesia.

The cannibalism of the Fijians is naturally incorporated in their religion. Their gods are described as delighting in human flesh, and to minister to this horrible propensity neither age nor sex are spared. At one time, with each basket of fruits brought to their idol a human body, male or female, was required. But this was peremptorily forbidden by the chief on his observing some informality in the treatment of the victim; thus showing virtually the power of the chief above that of the god. Divination and witchcraft are also practised, and the effects of the latter regarded with general dread. The tabu, or system of prohibition common throughout Polynesia, prevailed amongst the Fijis, whose religious belief included a future state, which in its chief characteristics very much resembled the present life.

But the most repulsive and appalling custom among the Fijis is their cannibalism. With them it was not an occasional exhibition of the extreme abasement to which human nature can sink, but a regular custom, and by the mass regarded as dignified and commendable. Human bodies are eaten in many of the frequently occurring events of life: on building a temple, commencing the structure of a canoe, launching the canoe; and men are sometimes killed to furnish blood with which to wash the decks of a newly-made canoe, and the bodies of such men are eaten. On the arrival of a new canoe at an island, fourteen or fifteen men have been killed and baked to make a feast. The same has taken place on lowering the mast for the first time. On one occasion the number of bodies procured was more than could be consumed. In this case the limbs were cooked, but the trunks thrown away. Two days were occupied in cutting off and cooking the limbs. In the year 1851 fifty bodies were cooked at one time on Namena. Prisoners taken in war, and those who escape from shipwreck, are usually eaten,—the former being first offered to the war god, and then prepared for food. Sometimes the human body is baked whole, in which case, on being removed from the oven, it is placed in a sitting posture, covered with black powder, and in this state it is carried about as if alive.

Revenge is a frequent but not the only cause of this revolting practice. The only motive sometimes seems to be the gratification afforded by eating human flesh. It is never eaten uncooked, though the victim be in full health and vigour. Young women are sometimes placed alive amongst heaps of vegetables, and other food presented to the chiefs, but would be killed and baked before being eaten. The victims are confined to neither age nor sex; gray-headed persons and children of both sexes furnish the repast. Some of the chiefs never eat human flesh, but they are exceptions to the mass of the people; women seldom eat of these bodies. When a chief has wished to have the skull of an enemy for a soup-dish or drinking-cup, orders have been given not to strike the victim on the head. Murder for this horrible purpose is sometimes rendered more horrible by the infliction of tortures,—such as cutting off limbs of the victim while still living, cooking and eating them before him, and even making him eat part of his own flesh. The number of bodies eaten by some of the chiefs appears also almost incredible. Human nature has never presented depravity so revolting as that by which this custom, not arising from any want of wholesome food, exhibits.

The Fiji race, distinguished among other races as they undoubtedly are by physical and intellectual vigour, by industry, skill, and daring, their inhuman barbarities and cannibal orgies were such as to deter commerce from their shores, and even to repel all attempts of humanity and religion to rescue them from apparent self-destruction, and to render such attempts, according to all human appearances, hopeless, if made. Insurmountable, however, as the difficulties appeared, and imminent as was the peril of the attempt, it has been made; and these natives, far as they seemed removed beyond the reach of the humanizing influences of true religion, have formed no exception to the evidences so abundantly furnished in the present age of the power of the gospel.

In the year 1835 two Wesleyan missionaries from the Tonga Islands went to the Fijis. They were received and protected by the king of Lakemba, and encouraged by a number of Tongese residing there. They made themselves acquainted with the language, prepared books, taught the Fijians and Tongans, and preached to them the gospel, assisted by native Christians from Tonga.[1] A number of the Tongans placed themselves under instruction, and after a short time professed themselves Christians. In 1838 one of these devoted men proceeded to Rewa, and there, under the protection of the king, prosecuted his arduous work. Additional labourers arrived during the same year, and the printing-press was set to work. In the next year missionary labours were commenced in Vanua Leva, or Great Land, where one of the earliest events after their arrival was the strangling of sixteen women in honour of a young chief and his companions who had been lost at sea. The missionaries tried in vain to avert the cruel fate of these women. Soon afterwards eleven dead men were brought and laid down before the house, and there cut up and cooked in ovens not far distant. The endeavours of the missionaries to dissuade from this practice, and even the drawing down the blinds of their windows that they might not witness the horrid spectacle, offended those who were preparing this inhuman repast. The missionaries, however, continued their labours, and the first convert was the king's brother, whose protection and influence greatly aided their efforts, and averted the execution of the threat of the king, that he would kill the first person who should embrace the new religion.

In 1840 the converts amounted to twenty, and the missionaries constantly employed their influence to save women from being strangled and captives from death. But seven years afterwards the discouragements induced the missionaries to leave this station, and seek a more promising field. They had continued their labours amidst many trials,—sometimes interposing to save life, at others endeavouring to induce the people to receive their message. The following account shows the manner in which two of the missionaries, in 1849, interposed in the midst of horrid butchery, and even in the presence of the cannibal king, to save the lives of a number of devoted women:—"Fourteen of the poor creatures were seized, one man who was with them being killed on the spot. The news of the capture reached Mbau the day before the canoes, and great was the rejoicing. The place was all excitement, and the people flocked together to greet the approaching fleet of death. The report soon crossed over to Viwa, and reached the mission-house,—'Fourteen women are to be brought to Mbau tomorrow to be killed and cooked for the Mbutoni people.' Mrs Calvert and Mrs Lyth, missionaries' wives, were alone with the children. Their husbands were many miles away on a distant island. The thought of the horrid fate which awaited the poor captives roused the pity of those two women. But what could be done? Every moment was precious. Amidst such fiendish excitement, it would be a desperate thing for any one to venture into Mbau for the purpose of thwarting the blood-thirsty people. Those two noble women determined to go. A canoe was procured; and as they went poling over the flat, they heard with trembling the wild din of the cannibals grow louder as they approached. The death-drum sounded terrible, and muskets were fired in triumph. Then, as they came nearer, shriek after shriek pierced through every other noise, and told that the murder was begun. Fear gave way to impatience at that wild warning, and the English women's voice urged the labouring boatmen to make better speed. They reached the beach, and were met by a Christian chief, who dared to join them, saying, 'Make haste! Some are dead; but some are alive.' Surrounded by an unseen guard which none might pass through, the Christian women passed among the blood-maddened cannibals unhurt. They pressed forward to the house of the old king, Taura, the entrance to which was strictly forbidden to all women. It was no time for ceremony now. With a whale's tooth as a present in each hand, and accompanied by the Christian chief, they thrust themselves into the presence of the king, and prayed their prayer of mercy. The old man was startled at the audacity of the intruders. His hearing was dull, and they raised their voices higher, and pled for their dark sisters' lives. The king said,—'Those who are dead are dead; but those who are still alive shall live.' At that word a man ran to Ngavindi to stop the butchery, and returned to say that five still lived; the rest of the fourteen were killed. But the messengers of pity could not leave their work unfinished. They went to the house of the murderer, and found him sitting in state in full dress, but evidently very uncomfortable. He winced under the sharp rebukes of the missionaries' wives, and muttered something about his friendliness to the *lotu*. Even in cannibal Mbau, all did not consent to the deed of darkness. Thakombau's chief wife, and Ngavindi's wife, had already secured the life and liberty of two of the victims; and when Mrs Calvert and Mrs Lyth left there were others who blessed them for their work of love. What the doing of it cost those intrepid hearts none may know; but their deed stands in the record above all praise. They have their reward." (*Fiji and the Fijians*, vol. i., p. 288.)

In 1854, after many reverses, Thacombau, the powerful king of Mbau, made a public profession of Christianity, and this facilitated the spread of religion among his people; and amidst many perils and labours, the missionaries have persevered. There are eight missionaries and a number of native teachers. They number about 60,000 hearers and 7000 church members; while the influence of their labours is visibly extending among classes who are still the votaries of idolatry.

---

[1] Before the arrival of the Europeans, native missionaries from the Society Islands had resided among this people.

The Tongan or Friendly Islands.—This group, comprising three principal clusters, with a number of smaller ones, is situated to the S.E. of the Fijis, from which it is distant about 300 miles, lying between 19. and 22. S. Lat., the N.W. point of Lefuka, one of the largest of the central cluster, lying in 19. 45. S. Lat., and 174. 14. 30. W. Long. Vavau, the principal island of the northern cluster, is about 35 miles in circumference. Tonga, the largest of the southern cluster, is about the same. Hapai and Lefuka, the largest of the central cluster, are much smaller. These latter are surrounded or connected with about thirty smaller islands; and the whole of these are called the Hapai cluster. Most of the Friendly Islands are low coral formations, some of them covered with rich soil. The uniform elevation of Vavau is a few hundred feet above the sea, while the highest land in Tonga is a round hill about 60 feet high. A few of the islands are lofty and volcanic; in some of the latter volcanoes are in action, while the evidences of volcanic disturbance appear in places where no actual eruptions take place. It is stated by Erskine (*Voyage of H.M.S. Havannah*, p. 120) that "earthquakes are very common, and there are several active volcanoes in the islands. Amargura or Fanua-lai, in about 18. S. Lat., is said to have been so shaken by an eruption in June 1846, that canoes can now sail in and out of the crater; and the Rev. Mr Lawry describes the islet, which until that year was covered with verdure and abounded with fruit, as changed, in August 1847, to a mass of lava and burnt sand, without one leaf or blade of grass of any kind. All things that had life had been utterly destroyed; the inhabitants having, however, warned by violent earthquakes which preceded the eruption, previously escaped to Vavau. Mr Lawry adds, that the noise of the 'fiery disgorge' was distinctly heard at Niua Foou, distant 100 miles, and that its withering effects on the trees and crops, which it damaged considerably, were experienced at Vavau, 35 miles off. An American ship, the Charles W. Morgan, had sailed through a shower of ashes for 40 miles, getting out of it in Lat. 11. 2. S., and Long. 171. 45. W.; and another, the Massachusetts, at the same time, although 60 miles farther to the eastward, had the deck covered with ashes, which the crew were obliged to clear off from time to time. Banks were also said to have been raised above the level of the sea to the eastward of Tonga-tabu."

The navigation among the Tongan islands, though less dangerous than among the Fijis, is intricate, and, excepting in favourable weather, perilous, and the attraction to ships not so great as those presented by other islands. They furnish but few articles of exportation, the chief productions for barter being vegetables, roots, and other supplies for whaling vessels. At some, water is neither abundant nor good. The productions are those common to other islands, though apparently fewer in variety than in the neighbouring group of the Fijis. Pigs are not numerous, and are generally kept confined, sometimes in the trunks of hollow trees, which are thus used as sties. Many of the islands, however, are well cultivated. Speaking of the difference between the island of Vavau as seen from the outer sea and the inside of the harbour, Captain Erskine observes (p. 121),—"On walking to the king's residence, called Mua, a distance of a mile or two, we were astonished with the richness of the country, cultivated like a garden. The broad pathway, admirably kept, is bordered by the 'ti' plant and other evergreens, regularly planted, while behind them are seen the provision-grounds of bread-fruit and bananas." And on landing at the island of Lefuka, he continues,—"entering a large inclosure, we found King George and his wife seated in a house of moderate dimensions, which it is understood he only occupies during the construction of a larger one on a European model. This house differs from those of his subjects in being inclosed nearly all round with reed-work, resembling the fences of the country, and in being divided into two separate rooms. Although both George and the queen were seated on the ground in the usual manner, there were a table and one or two chairs in the room; and on shelves around were ranged some dishes and plates of English crockery, with a few decanters, and bottles of clear glass containing scented cocoanut oil. The king himself is a very fine-looking man, about forty-five years old, above the ordinary size even of his own people, and apparently of great personal strength. He was lightly clothed in native cloth, as was his wife, a stout, handsome woman, with her only son, an intelligent boy of seven or eight years old, seated by her. The complexions of both were a clear brown, differing very little, if at all, from the hue of the Samoans; the boy, as is usually the case with children, being a good deal lighter in colour. On presenting his hand to shake, I remarked that George had one joint of the little finger amputated, an operation which, under the name of 'tutuu-nima,' it is well known is still common, and was formerly almost universal as a sign of mourning, or of deprecation of sickness or misfortune."

The population of this entire group has been variously estimated. Commodore Wilkes reckoned it at 18,000, and Mr Lawry states that in 1841 it was supposed to be 50,000. Captain Erskine observes that the population of the whole of these islands may be estimated at between 20,000 and 30,000. (*Voyage of H.M.S. Havannah*, p. 13.) The colour, features, and stature of the people resemble those of the Samoans. Many of the natives are tall and well made, and some of the chiefs are remarkably fine and noble-looking men. In describing the people, Captain Erskine (p. 155) observes,—"The Tongans, in personal appearance, resemble so closely the Samoans, that no person would hesitate at first sight to pronounce them the same people; and as their habit of tatooing their bodies, from the hips to below the knees, is precisely similar, a stranger would find it difficult to distinguish individuals of the two groups if they were placed naked before him. On further acquaintance with this people, one is struck with the marked superiority in stature and the lightness of colour on the part of the chiefs over the common people, betokening a great difference in the care bestowed on their nursing and food during childhood, and the degree of exposure they are subjected to afterwards. That this distinction is not a mere outward one is soon perceived, the authority of the chiefs, as well as the gradations of rank, being everywhere apparent. The effect on manners is also evident, although not exactly what one would expect from a system which exacts great ceremony and attention from inferiors towards superiors. The manners of the chiefs are certainly as polished as those of the Samoans, and not inferior in courtesy to any in civilized life; but the common people, when not in the immediate presence of their chiefs, are much more rude and boisterous than in Samoa, and less agreeable people to deal with generally."

The southern portion of this group was discovered by Tasman in 1743, who gave the name of Amsterdam to Tonga,—sometimes called Tonga-tabu,—*Tonga* being the native name of the island, and *tabu* intimating that it was regarded by them as sacred. These islands were visited by Captain Cook between the years 1773 and 1777. In consequence of the attention he received, the profuse hospitality, apparent amity, and the efforts to gratify their visitors, on the part both of chiefs and people, Captain Cook designated the group the Friendly Islands; though it afterwards appeared that, at the very time the chiefs were feasting and amusing their guests with night-dances and other exhibitions, they had planned their death and the destruction of their ships, and were only prevented from carrying their purpose into execution by the departure of the vessels.

The first attempt to form a settlement on these islands was made by a number of missionaries from the London Society, sent out in the ship Duff, under the command of Captain Wilson, who, after establishing the mission in Tahiti, landed ten English missionaries at Tonga in 1797. The chief of the place promised them protection; and in the hope of acquiring the language, and prosecuting their benevolent object, they took up their abode on the island. Some abandoned sailors whom they found on shore prejudiced the minds of the chiefs against them, and the people ascribed the calamities they suffered to the presence of the missionaries and the influence of their God. After enduring great privations, having three of their number killed by the natives, and feeling their own lives in peril, the remaining missionaries left the island within three years of their arrival. Intestine wars prevailed among the people at the time; and six years afterwards a British vessel, the Port-au-Prince, mounting upwards of forty guns, and carrying a corresponding number of men, was seized by the natives, and all on board, with the exception of a youth named Mariner, and one other, were massacred. In recent years vessels have occasionally resorted to these islands and to the Fijis to procure sandal-wood for the China market, or to obtain refreshments; and several have been wrecked in the difficult navigation of this region, or have been seized and destroyed by the people.

In 1822 Mr Lawry, a Wesleyan missionary, visited Tonga, and returned after remaining little more than a year on the island. Native teachers from the Tahitian Islands reached this group in 1823, and one of them laboured faithfully in Tonga, where he was joined by others, who continued the work until the arrival of Mr Thomas, a Wesleyan missionary, who reached Tonga in 1826, when they cheerfully led their adherents to the efficient teaching of the European missionary, and continued to labour on in promoting the Christian faith among the people. Other missionaries followed from England; and although the force of pagan habits and superstitious feeling among the people, the opposition of the priests, and the formidable hostility of some of the chiefs, greatly impeded their efforts, they still persevered. The nature of this hostility may be inferred from the fact, that one of the chiefs, Finau, the king of Vavau, publicly told the missionaries that the teachers might stay, and he would protect them; but that he would neither receive Christianity himself, nor allow any of his people to do so, for he would put to death the first man, woman, or child that did; a threat which they did not doubt he at that time would fulfil. The missionaries directed their efforts to the acquisition of the language, the preparation of books, and the teaching of some few of the natives to read, seeking by both preaching and teaching to induce them to adopt the Christian faith; and at length a certain measure of success followed their endeavours. Numbers of the people and the chiefs, especially the king of the Hapai Islands, who was baptized in 1830, encouraged others, who, one after another, renounced their confidence in their idols, treated them with indignity, desecrated their sacred places, and professed themselves worshippers of the true God. Amongst these was the king of Vavau himself, who in 1831 made profession of the Christian faith.

In 1831 the printing-press commenced its operations, and elementary books, as well as those inculcating Christian truth, were multiplied. Chapels were built, the Sabbath observed, and worship established at the islands of the Hapai and Vavau clusters. The circumstances and the habits of the people improved; they built themselves better houses, provided better clothing and regulations and laws for promoting order and the general good of the people were established. There were still in the island of Tonga a number of adherents to the ancient idolatry and heathen practices of the country; and in 1837 and 1840 the island was involved in the miseries of civil war. During the latter period H.M.S. Favourite, under the command of Captain Croker, arrived. He undertook to aid the Christians, landed some of his guns, and, accompanied by a number of his men, proceeded to a fortress belonging to the heathen party to propose peace; but not succeeding, he then attacked the place. The captain was killed, and nineteen of his officers and followers wounded. These, with the dead bodies of their comrades, his companions barely succeeded in carrying off.

Two years before this, some Roman Catholic priests had reached the islands, but though kindly treated, were not allowed to remain. In 1841 a French vessel of war arrived, followed by another with priests on board. The captain of the armed vessel remonstrated against the non-reception of the priests by the chiefs and people as a violation of the law of nations, asking at the same time if they had not heard what the French had done in Tahiti and the Sandwich Islands. Although this did not induce the chiefs to receive them, another party afterwards arrived at Tonga, and were received by the heathen party, who professed themselves Papists. In 1851 war broke out again between the heathens and the Christians, the Romish priests remaining with the former; and when, in 1852, the heathens surrendered their fort, the Christian king protected the persons and property of the priests from the soldiers.

Speaking of the influence of the Roman Catholic priests, and the interference of French armed vessels on their behalf, Captain Erskine observes—"The apprehension of foreign invasion has been very general among the Polynesian islands since the establishment of the French protectorate at Tahiti, and the obligation then imposed upon the people to receive Roman Catholic missionaries in opposition to the general will. No chiefs with whom I have conversed have ever expressed any objection to the enforcement on the part of their people of justice towards the subjects or the citizens of another power; but in those islands where Christianity, as taught by Protestant missionaries, has taken root, the forced obligation to admit priests of a different persuasion is always complained of as a heavy grievance; a feeling which, it must be allowed, need not proceed from fanatical or narrow-minded motives."[1]

The Protestant missionaries in these islands have continued their labours, have raised the standard of education in a number of their schools, and extended the influence of the gospel among the people, who now possess, in their own languages, the whole of the New Testament, of which 10,000 copies were recently sent to the islands, besides several portions of the Old Testament, hymn-books, catechisms, &c.

The results of missionary effort in the Fiji and Friendly Islands have certainly been in a high degree satisfactory to the labourers engaged, and encouraging to those occupied in the same work elsewhere.

The Samoan Group, or Navigators' Islands.—These islands lie between Lat. 13. 30. S., Long. 173. and 168. 18. The most easterly of the islands were discovered by Bauman, a captain in Roggewein's expedition, in 1722; another of larger size by Bougainville in 1768; and the two larger to the westward by La Pèrouse in 1787. The whole were visited in 1791 by Captain Edwards in the Pandora, sent out by the British government in search of the Bounty. But they were little known until after the commencement of missionary operations in 1830. The French often call this *L'Archipel des Navigateurs*, a name originally given to the eastern portion only, when discovered by M. De Bougainville in 1768; the natives, however, term the whole group *Samoa*, which, decidedly more correct and appropriate, is generally superseding its comparatively modern designation, usually rendered into English as the *Navigators' Islands.* This group, which is called by the inhabitants *Sa-moa*, consists of eight islands:—Manua, Orosenga, Ofu, Tutuila, Upolu, Manono, Aborima, and Savaii. In addition to these there are several small islands off the coast of Tutuila and Upolu.

Manua is the first island west of Rose Island. It is about 18 miles in circumference, and upwards of 2500 feet above the level of the sea. Its shores are high and bold, rising in most places precipitously to the height of 300 or 400 feet. Above this the ground inland swells gracefully until it attains its greatest elevation, like a vast dome above some huge citadel. It is well wooded, and covered with rich verdure to its summit. Four miles N.W. of Manua is Orosenga, consisting of a narrow ledge of rocks, 3 miles long, rising abruptly out of the water. The only productive portion of it is a narrow strip, running lengthwise of the island, and overspread with the most luxuriant vegetation. Ofu is west of Orosenga, separated from it by a channel for boats, one quarter of a mile in width. It is of little importance, and contains but few inhabitants,—most of them having been cut off during the sanguinary wars which have more than decimated the population of these islands.

Tutuila, 15 miles west of Ofu, and visible therefrom in fine weather, is the most central, and, after Upolu, the most important island of the whole group. It is nearly 50 miles in circumference, its shores precipitous, with generally a broken and rugged appearance, occasioned by the numerous sharp spurs and ridges which vary its surface. Its scenery is highly romantic; and its unevenness is more than half-concealed by forests of cocoas and bread-fruit: the thickly-matted verdure, interlaced with creepers, covers the island as with a carpet. Its highest peak is Matafoa, upwards of 2300 feet above the sea. Tutuila contains a large population, chiefly congregated in the valleys and plains sloping down to the ocean. Lofty and impassable hills separate the island into two parts, the only intercommunication being by the seashore. The part on the N.E. is exceedingly rough and uneven; that on the S.W. lower, more level, and easy of cultivation. Tutuila was visited by the unfortunate La Pèrouse in December 1788, and derives a melancholy interest from the fact that M. De Langle, captain of the Astrolabe, and the naturalist of the expedition, with ten other persons, lost their lives there in a collision with the natives.

Upolu, 36 miles W. of Tutuila, is 70 miles in circumference. It is neither so lofty nor so much broken as the other islands of the group; but in population, beauty, and fertility, far exceeds them all. The land rises gradually for some distance from the shore, and then breaks into a succession of mountainous ridges, clothed to the top with the richest verdure. Wide tracts of table-land lie along the coast, and broad valleys between the ridges, carpeted with flowers and diversified with clumps and groves of bread-fruit, pandanus, and cocoa-nut. The steep hill-sides are fringed with the white foliage of the candle-nut, the long fronds of fern-tree and the mountain-palm. The hamlets of the natives enliven the scenery. On one side there is all the dreamy softness of an Italian landscape; on the other the sublime grandeur of Alpine scenery. Within the sea-reef of Upolu, and near its western extremity, is the small but important island of Manono, on which there is a missionary station. Directly off the west end of Manono lies the islet of Nulofa. Connected with Upolu and Manono by a line of soundings is Apolima, about a mile to the west of the latter. In former days this was the citadel of the inhabitants of Manono in time of war and danger.

Savaii, the westernmost and largest of the group, is also connected with Apolima by a line of soundings, at the distance of 3 or 6 miles. It is not so populous as Upolu, and its outline is much less beautiful. It is above 100 miles in circumference, and is protected on the north and east from the violence of the surf by reefs of coral; on the opposite sides, however, the breakers dash unchecked against the rocks. Except on the south and west the shores are low, and there is a gradual ascent to the centre of the island, where many extinct volcanic craters are seem. Above these towers a single peak, 4500 feet high, almost always enveloped in clouds, and on a clear day visible at a distance of 50 or 60 miles. Mountain streamlets, sometimes swelling into rivers, frequently intersect the larger islands, with the exception of Savaii, which has no permanent streams, though possessing an abundance of copious springs. There are likewise numerous lakes and waterfalls, the latter of which may one day be serviceable for mills or machinery. On Upolu there is a pretty lake called Lauto, occupying the basin of a crater 2450 feet above the level of the sea, with 9½ fathoms in its deepest part, and having a subterranean outlet. Like the Society Islands, the members of this group appear to be of volcanic origin, and are generally surrounded by coral reefs, with occasional openings, through which vessels may pass. The general structure is conglomerate, lying in horizontal strata. All the higher hills and mountain peaks are volcanic. The soil is principally formed of decomposed volcanic rocks and vegetable mould. The climate is mild and agreeable, and the temperature about 80 degrees. It is more moist than Tahiti, and the vegetation more thrifty. Nearly one-third of the days in the year are rainy. From April to November the season is fine, the winds being light, and affording merely a pleasant variety in the long-continued calms. During the remainder of the year high winds prevail, principally from the south and east. Destructive hurricanes sometimes occur; and earthquakes are not unfrequent. The latter are not usually violent, but produce a slight wavy motion, like that of a vessel in an ordinary sea.

---

[1] During the year 1858, it is stated that, because the governor of Vavau refused to allow some priests to settle on the island without the consent of the king (which is the law of the islands), the captain of a French armed vessel proceeded to Tonga; required the king to dismiss the governor, who had only acted according to the laws of the country; to build houses and inclose lands for the Catholic priests equal to those occupied by the Wesleyan missionaries; and that the king was obliged to comply with this request.

There are a number of excellent harbours among these islands; and the navigation, being exempt from intricacies and perils of numerous low or sunken reefs, is comparatively safe. Excellent water is abundant. The whole group covers a surface of about 2000 square miles, and much of the land is fertile and available for cultivation. The commercial resources of the islands are undeveloped; although about sixty ships, chiefly English, American, and colonial, visit Apia, the harbour of Upolu, annually, principally for refreshments.

The natives of this group are handsome and well-made Malayo-Polynesians, a shade darker than the Society islanders, but in features bearing a strong resemblance to that race. Their language, although copious and refined, contains many words similar to those found in the Tongese dialect; and it is also said, in construction, closely to approximate to the Tahitian, being even yet smoother, softer, and more flexible than that tongue, though not so easily spoken. The sounds of the Samoan alphabet are represented by an alphabet of fourteen letters; and it is remarkable as the only branch of the Malayo-Polynesian family in which the sound of the *s* is heard.

The population of Samoa has been variously estimated from as many as 160,000 to as few as 38,000. The Rev. J. Williams estimated them at the former number in 1830, and Captain Erskine, in 1854, at the latter; but by the missionaries (*Samoan Reporter*, 1845) the population was reckoned at from 50,000 to 60,000. At present the Samoan nation does not probably exceed 40,000 souls.

In the year 1830 Messrs Williams and Barff, from the Society Islands, visited the Samoas in a small vessel built by Mr Williams, for the purpose of extending the blessings of Christianity to the remote islands of the Pacific. They found the islanders engaged in war; and one of the first objects which attracted their notice on the shore was the smoke and flames of the burning villages on Upolu. The king left the seat of war, and came to bid them welcome. He expressed his willingness to receive and protect the missionaries, but declared, in answer to their endeavours to persuade him to peace, that he must finish the war in which he was then engaged, and after that there should be peace. Eight native missionaries, five of whom were accompanied by their wives and children, were at that time left on these islands, and a promise made that white men should come and reside amongst them. Two years afterwards Mr Williams visited them again, and found that numbers of the people, including the inhabitants of thirty villages, with some of the chiefs, had renounced the idols of their country, and were pupils of the native missionaries. During his visit the king avowed his determination to become a Christian, and to exert his influence to extend Christianity throughout the islands.

In June 1836 six missionaries, five of them married, arrived from England, and were welcomed by all classes, who promised their protection, and expressed a willingness to receive their instructions. As an evidence of their sincerity, and to show their disposition to attend to the wishes of the missionaries, the inhabitants of Aana, who had been conquered in the war raging when the first missionaries arrived, were invited to return to the lands. Four hundred of these had been cruelly burned to death, and the rest banished. The exiles were now invited to re-occupy their country; and in less than eighteen months three thousand of them returned, rebuilt their villages, and tilled their lands. The number of the European missionaries was afterwards increased, and they acquired the language, prepared books, and taught the natives to read. In 1839 the labours of the press were commenced; and the greater part of the population had renounced heathenism. A Wesleyan missionary and some native teachers had come from Tonga; but in order to avoid the disadvantages that might arise from the slightest apparent difference in teaching Christian truth among a people who were only beginning to learn the difference between Christianity and heathenism, it was arranged by the societies at home, in accordance with the agreement entered into at the beginning by the missionaries of the two groups, that they should confine their operations to the fields they first occupied; and thus this cause of apprehended difficulty was then removed.

In 1846 a number of Roman Catholic missionaries arrived, and are labouring in the islands, where there are at present a bishop, a number of priests, seven places of worship, and above 500 adherents.

The Protestant missionaries have, besides the ordinary native schools, established schools of a higher class for the more intelligent youth, and boarding-schools for females, in which upwards of 100 are taught. They have also maintained, in great efficiency, an Institution for training native teachers, from which a number of excellent men have gone forth as pioneers to European missionaries among the most ferocious and hostile of the cannibal and other islands to the west. The teachers remain in the Institution from three to five years before they are sent forth. This institution contains 57 young men in the teachers' class; 45 in the youths' class; wives of the teachers, 47; their children, 45; making 244 in the establishment. 137 teachers have been educated and sent forth from this institution. Besides lesson-books and catechisms, books on arithmetic and geography have been printed, not in the Samoan only, but also in the languages of the islands to which native teachers have been sent; and the printing of the whole Bible, after a committee of missionaries had been occupied for nine years in its revision, was completed in 1855—less than twenty years after the arrival of the European missionaries. Part of the expense of this establishment is defrayed by the natives, who also purchase the copies of the Scriptures, and contribute liberally towards the extension of the gospel. During the year 1856 they contributed for these purposes L.1203. There are in these islands 11 missionaries (including the missionary printer), 190 native teachers, 154 schools, 4700 scholars, and 2500 native communicants. The entire native population, with the exception of a very small number, profess Christianity. There is also at Apia, on Upolu, a chapel for seamen, of which, at certain seasons, there are large numbers in the port. An English and an American consul, with about sixty foreigners, reside there, and an equal number in the other parts of this group.

To the northward and eastward of these groups are three smaller clusters, with a number of single islands and lagoon reefs. The chief of these are

Ellice's Islands, or Vaitapu Group.

Ellice's Islands, or Vaitapu Group.—A numerous cluster of straggling low coral islands, situated to the northward of the Friendly Islands, and W.N.W. from the Samoan, from which they are distant 500 miles. These are sometimes called *De Peyster's Islands.* The centre of Vaitapu, also called *Achilles Island* and *Tracy Island*, is situated in 7. 28. S. Lat., and 178. 44. E. Long. It is a lagoon island, and contains about 400 inhabitants.

The islands of this group are well wooded with the cocoa-nut, Pandanus, and Pisonia; and their inhabitants chiefly subsist upon the first two, together with a species of taro, and another larger root called *pulaka.* The people of these islands are darker in complexion than the Fakoafoans and Samoans, to whose language their own has a considerable affinity; and they are regarded by ethnologists as an interesting and important link between the races of N.W. Polynesia, and S.E. Micronesia. They practise tattooing; and both sexes wear the *maro*, as well as the *takai*, or girdle, with a heavy fringe two feet broad for the women, but narrower for the men. They have many peculiar weapons; and large canoes hollowed out of a single tree, for which they use sails of a triangular shape, with outriggers and paddles, like those common in Polynesia. The population is supposed to be not more than 1700 to 1800.

Phœnix and Union clusters.

To the north-east of these is situated the *Phœnix* cluster, consisting of seven or eight islands uninhabited. Birnie's Island, one of the largest, is situated in Lat. 3. 34. S., and 171. 3. W. To the south of these is situated the *Union* cluster, consisting of three principal islands, viz., Otafu, or Duke of York's Island; Nukanono, or Duke of Clarence Island; and Fokakafo, or Bowditch Island. These islands are of a coralline formation, and in their general aspect resemble the atolls of the Paumotus. Their inhabitants (who chiefly subsist on cocoa-nuts, pandanus-nuts, and fish), are stated to have been, previous to the arrival of foreigners, altogether unacquainted with the use of fire. They are a quiet and harmless people, considered to be the fairest race in Central Polynesia, and much resembling in form and feature the natives of Samoa, to whose language their dialect is similar. They are not numerous, probably not more than 1000.

Hervey Islands.

The Hervey Islands.—This cluster of seven islands, of which six are inhabited, is situated between Lat. 18. and 22. S, and Long. 157. and 160. W. Several of the islands, including that from which the cluster takes its name, were discovered by Captain Cook in 1773 and

1777. They are of different structure, Rarotonga, the largest, being volcanic and mountainous, surrounded by a reef of coral. Others consist of ancient coral formations raised from 20 feet to 60 feet above the sea, some of them lower, and all surrounded by live coral reefs. Most of the islands are fertile, and capable of supporting a much larger population than the present, which has been estimated at 11,000. The inhabitants belong to the Malayo-Polynesian race, and as they are able to trace their origin satisfactorily and clearly, they have had, in all probability, fewer infusions from other sources than the larger groups. Their language bears a striking resemblance to that of the Samoas, from which part of the people have been derived. It also resembles the New Zealand and Sandwich Island dialects, as well as those of the more central islands. Little was known, excepting what Cook has recorded of some of them, until 1821, when they were visited by missionaries. The first account of the largest island is that given by Mr Williams, who found it in 1823. At this time the inhabitants were heathen, their idols corresponding with those of Tahiti; their government a sort of feudalism; they were addicted to war; and were cannibals. Their history is the history of the introduction and influence of Christianity; their intelligence, civilization, industry, and piety, the effects of Christianity amongst them; and, according to the concurrent testimony of all who have visited them, these effects have been as extraordinary as they are satisfactory.

Rarotonga, the largest island, with its encircling reef, is about 35 miles in circumference, the highest mountains about 4000 feet above the sea. There are openings in the reef, but no secure harbours for shipping. The island is well watered and fertile, yielding the bread-fruit, cocoa-nut, banana, taro, and other Polynesian productions. The ferocity and barbarity of the natives, when the missionaries visited them in 1823, were such that the native missionaries and their wives dare not remain amongst them, and a single man was the only teacher that could be left. He was afterwards joined by another. Their efforts in humanizing the barbarians, teaching refined lessons of Christianity, inducing them to cast away their idols and profess themselves worshippers of the true God, were eminently successful. In 1827 the first European missionary arrived amongst them, and the second in the following year; and these were subsequently followed by a third. Their efforts were neither unopposed nor exempt from danger from the natives; but with their native associates they persevered, and the whole island became an educated, industrious, civilized, and Christian community, increasing in intelligence and comfort as their industry in raising supplies brought ships in considerable numbers to their shores for refreshments; and the returns enabled them to provide clothing, books, and many of the comforts of civilized life. A large proportion of the people are clothed in European apparel, and dwell in comfortable houses, (some of them built of stone), manufacture useful furniture, and have an abundance of native food. They have regular market-houses in which supplies for shipping are collected, and salesmen appointed to manage their trade with foreigners; about ten merchant and thirty whaling ships visit the island every year. In 1831 the printing-press was set up in the island, and has printed spelling-books, reading lessons, hymn-books, catechisms, Pilgrim's Progress, and other religious books, including the several parts of the Old Testament and commentaries on portions of the New Testament, besides elementary books on arithmetic, grammar, geography, astronomy, and natural history. Books in the language of the New Hebrides, and New Caledonia and other islands to the west, have also been printed. Upwards of 20,000 small books were stitched up in covers, and nearly 6000 books bound in leather, all accomplished by native young men taught by the missionaries. The whole of the Bible has been translated by the missionaries, and printed for the people by the British and Foreign Bible Society. Few, if any, of the young are unable to read and write; and there is an admirable institution for training native teachers in carpentry and useful arts; as well as in the learning required for the efficient discharge of their duties in their own island, or as missionaries to other islands, and the steadfastness, energy, and remarkable success which has attended their efforts, is evidence of the value of the training they have received. The entire population is Christian. They have at their respective stations spacious and substantial stone chapels, well built, and suitably fitted up by native workmen. Thirty years after the commencement of missionary effort there were 7000 communicants connected with the churches, and nearly 1000 communicants had been removed by death. The island has been visited repeatedly by fearful hurricanes and the ravages of diseases, which, with other causes, have greatly diminished the population, and retarded the progress of the people; but they have been favoured with peculiarly well qualified and devoted European teachers. Mr Williams felt great attachment to the people, and laboured some time among them; built his missionary ship at the island; and when he fell a martyr to his holy zeal as a Christian missionary, was mourned as a father by the people.

The other islands of the cluster, Mangia, Aitutake, Atiu, Mauke, and Mitiaro,—smaller islands, the largest not above 20 miles in circumference, and all of coral formation,—were some of them discovered by Cook, and their inhabitants were, till within the last forty years, cruel and ferocious cannibals. Mangia contains between 3000 and 4000 inhabitants; some of the others 1000. European missionaries reside on two of them, and native missionaries occupy the rest. Results corresponding with those on Rarotonga have followed their labours. Shipwrecked seamen are safe; supplies to vessels are furnished; the whole population is civilized, intelligent, and Christian, maintaining the institutions, and aiding liberally to extend the knowledge of Christianity to others. At the entire group, not fewer than 100 ships trade annually with the natives, and receive produce of native labour in exchange for manufactured goods, amounting to not less than L.3000. (Gill, *Gems from the Coral Islands*, vol. ii., p. 125.)

About 600 miles to the north of the Hervey cluster are Maniiki, Penrhyns, and Savage islands, all lagoon coral islands: the first containing about 1200 people; the second, Tongareoa or Penrhyns, 9 miles long and 5 miles broad, with about 1300 inhabitants; Niue, the Savage Island of Captain Cook, within two days' sail of the Samoas, nearly 40 miles in circuit, and containing a population of 3000 or 4000. Great dread of being wrecked among these islands was formerly felt by mariners sailing near; but they have been visited by missionaries, the people have become Christians, and have treated shipwrecked seamen with great kindness.

Society Islands.

Society Islands.—The first account of these islands is given in the voyage of Jacob Roggewein, who touched at Raiatea in the year 1722; at least it is conjectured by Burney, on probable grounds, that the Verquickking or Recreation Island of that navigator is the same. On sending a boat on shore, the inhabitants assembled on the beach, and advanced into the water armed with lances to oppose their landing. The Hollanders fired upon them, and having dispersed them, landed on the beach, and the inhabitants returned in a friendly manner, and brought them cocoa-nuts and other articles of food. The Hollanders then advanced up a valley towards the mountains; but some thousands of the natives coming out of the glens and crevices, made signs to them to return. The Hollanders, however, paid no regard, but proceeded, upon which showers of stones were hurled at them, by which some were killed and others wounded. These volleys were answered by a discharge of musketry, which killed many of the islanders, who nevertheless continued the action, and finally drove the Dutchmen into their boats. Many of the latter subsequently died of the wounds they had received.

Captain Cook visited these islands in 1769, and again in 1777. They consist of six in number (besides small coral islets), the names of which are Raiatea and Tahaa (both encompassed by the same coral reef), Huahrine, Borabora, Tubai, and Maurua. They extend from about 16. to 17. S. Lat., and from 151. to 152. W. Long. The climate and the productions resemble those of Tahiti. The surfaces of all the islands are uneven and hilly, in some parts mountainous; the hills are finely wooded, and the low lands exceedingly fertile. The inhabitants, like those of the Navigators' Islands, are above the middle stature. The late Sir Joseph Banks measured one of the natives of Huaheine, and found him to be six feet three inches and a half in height; and the women are described as generally somewhat fairer than those of Tahiti. Borabora differs from the rest of the islands by having a lofty double-peaked volcanic mountain near its centre. In Raiatea there is a large Marai, in which a number of jaw-bones are kept as trophies of war. The coral reefs which everywhere surround these islands form numerous safe and commodious harbours for shipping, and refreshments of hogs, fowls, plantains, cocoa-nuts, and other fruits; yams, sweet potatoes, taro, and similar edible roots, are generally to be had in great abundance.

In these islands the missionaries, though long disappointed, and though their lives were frequently endangered by the contests and revolutions which agitated the country, at last succeeded, by their perseverance and intrepidity, in establishing stations in Huaheine, Raiatea, Taha, and Borabora. The idolatry of these islands was the same as that which obtained in Tahiti, but was more zealously maintained, as Raiatea was supposed to be the cradle of their mythology. The people have been distinguished by their force of character, energy, and love of war, and have often exerted an important influence in the affairs of the islands to the eastward. Their form of government is in two of the islands a hereditary monarchy, and in the other principal island, viz., Huahine, that of a confederated state. The three chief islands—Huahine, Raiatea, and Borabora—have always been politically independent of any other group and of each other, and frequently at war among themselves. The destruction of idolatry in Tahiti in 1815 was followed, a year or two after, by the same change in these islands, not, however, without opposition. The inhabitants of Taha, strongly attached to their ancient idolatrous worship, opposed the introduction of Christianity, and even went to war with the King of Raiatea because he had agreed to renounce idolatry. But they were defeated in the contest, and their king was taken prisoner. Instead, however, of being put to death, as formerly, with cruel tortures, he and his people were humanely treated, which made such a deep impression on their minds that they embraced Christianity. In 1817 the missionaries first established themselves in these islands, and have been remarkably successful in educating the people, who are now all professing Christians, and many have gone to other islands, or are labouring in their own as Christian teachers. Commodious chapels and good school-houses have been erected; and a great change in the moral character, habits, dress, and mode of life, has taken place among the people. In addition to the indigenous productions of these fertile islands, oranges, pine-apples, custard-apples, and coffee have been introduced; as well as the manufacture of sugar, and the growth of cotton and tobacco. They have been taught to build comfortable houses and manufacture furniture; to work in iron and wood; and are described as a sociable, cheerful, and busy-moving community. Many engage in ship-building, unaided by Europeans, forging their own bolts, and performing whatever iron-work they may require, with the facility of ordinary artizans. Several of the schooners thus built by them are from 18 to 20 tons burden, and they have often as many as eight or ten upon the stocks at a time. The Huahinians are active and enterprizing traders, and their flag—which, in common with Raiatea and Borabora, is the same as the old red and white ensign of Tahiti—is well known and respected, even as far north as the seaport towns of the Hawaiian Islands.

Huahine first received a regular code in 1822. The "Ture na Huahine"—consisting of twenty-nine laws, with numerous ordinances respecting the due administration of justice appended thereto—having been solemnly enacted by the national assembly of this island in the month of May in that year. These were printed and published for general circulation; and afterwards, in 1826, considerably revised and improved; with various necessary modifications, they are understood to be still in force. An additional series, chiefly affecting the relations of foreigners with Huahinians, and those of natives with foreigners, were, subsequent to the second revision, put forth by authority, and adopted, under the title of "The Harbour Regulations of the Port of Huaheine," by Captain J. Laws of H.M.S. Satellite, 17th of March 1829. On accepting these last-mentioned ordinances, Captain Laws, on the part of Great Britain, officially recognised what is now usually known as the old flag of Tahiti (red, with a white fess or bar thereon), to be also the national ensign of the whole of the Society Islands. Similar laws and regulations have been established at the other islands, and a British consul resides at Raiatea, the central island of the group. A number of vessels, traders, and whale ships visit these islands annually; but the advance of the people in intelligence, civilization, and outward prosperity has been retarded by a series of impediments arising from the disturbance and civil war, in which the whole of the islands have been involved; the prevalence of epidemic diseases, which have swept off many of the people; the insolent and injurious conduct of foreigners in promoting intemperance and vice amongst the people. To the evils thus produced must be added the disorganization produced by proceedings of the French at Tahiti, and their forcible seizure of Huahine, from which they were expelled by the natives who held the island, till they were assured, on the authority of Admiral Seymour in 1847, that their independence with that of the other islands of the Society, or, as they are also called, the Leeward group, was secured and guaranteed by the English and French governments. Great attention has been given to the schools and the religious teaching of the people. The population is about 8000.

Georgian group.

Georgian Group, or Tahitian Islands.—Tahiti was discovered by Captain Wallis in 1767, visited by M. Bougainville in 1768, and by Captain Cook in 1769. The group consists of five principal islands, the most westerly about 70 miles to the S.E. of the Society Isles, between 17. 2. 23. and 17. 53. of S. Lat., and 150. 40. and 148. 9. 45. W. Long. The principal island of the series is Tahiti, which consists of two peninsulas, chiefly mountainous, but with a good deal of low land upon and near the coast well fitted for cultivation. The large peninsula is described as about 90 miles in circumference, the small one about one-third of that extent, and the isthmus connecting them about three miles across. Present population under 6096. Ten miles W. of Tahiti, from reef to reef, lies Eimeo, an island about 40 miles in circumference, wild and mountainous, but with a fair proportion of level land and magnificent scenery. It contains a population of about 900 souls. Between 40 and 50 miles to the westward of Eimeo lies another island, that of Tabuaemanu, much smaller than Eimeo, but of the same general character. The surrounding reefs of this island are so narrow and intricate that it can never be a place of any trade. The population of Tabuaemanu is not, it is believed, at present more than 200. This island, though geographically nearest the Georgian group, is politically connected with Huahine, the inhabitants acknowledge the supremacy of Huahine, and pay tribute to its chiefs; the laws of the latter are also the laws of this island. Tetuaroa, a small series of very low islets, with but few inhabitants, lies 24 miles to the north of Tahiti, to the ancient inhabitants of which it formerly served as a sort of watering-place. Lastly, Matia or Maitea, the most easterly of the Georgian group, is a steep mountainous island, very thinly inhabited, about 70 miles E. of Tahiti.

Tahiti and her adjacent islands are capable of producing sugar, oil, arrow-root, coffee, cotton, and indigo; but the Tahitians, never very fond of labour, have of late years, since the seizure of their country by the French, given themselves up to such sullen apathy, that any healthy development of the resources of their group seems to be, under existing circumstances, totally out of the question. Wilkes, however, informs us that in 1840 the yearly produce of sugar was, at Tahiti 105 tons, valued at 8000 dollars; and at Eimeo 22 tons, valued at 2000 dollars. Annual produce of cocoa-nut oil at Tahiti 55 tons, valued at 3500 dollars; and at Eimeo 20 tons, valued at 1500 dollars. Not a tithe of this has, it is understood, been produced of late years. Even the statistics of the whaling trade show that the French profit but little, in a commercial point of view, by the toy so dearly bought to satisfy the grasping ambition and vanity of one who died himself unsceptred. With every disadvantage, the United States' whalers are at Tahiti far before the French, and indeed those of any other nation. The Americans, in fact, here engross nearly all that lucrative trade. During the whaling season, for example, in 1854, thirty whalers arrived in the Tahitian harbours,—viz., one English, four French, and twenty-five American. The natives are stated to have abandoned agriculture. The few other arts which had begun to thrive in 1840 are now quite neglected. The guava has completely supplanted the grass; cattle, in consequence, cannot thrive, and have become well nigh extinct. The garrison, 300 in number, are all clothed and sustained by stores sent out from France, and have neither means nor opportunity to spend much money. Some appearance of trade, no doubt, is kept by the supply of these men with what they need; but, to judge from observation, it must be a ruinously unremunerative affair, a mere outlay without any benefit whatever. (*Gazetteer of Central Polynesia*, by E. Reeve, pp. 41, 42.)

The island of Tahiti is fertile and its scenery beautiful.[1] The bread-fruit is here superior to that which grows on the other islands. The fruit affords the natives a nutritive food; the trunk supplies them with timber for their buildings and canoes. It exudes a gum which serves for pitch, and from the inner bark is manufactured a substantial cloth. They reckon no less than thirty varieties of this most useful tree, which, with the different exposures to the trade-winds and the difference of elevation above the sea, afford to the natives a bread-fruit harvest at almost all seasons of the year. The cocoa-nut, next to the bread-fruit, supplies them with meat, drink, cloth, and oil, and sometimes clothing. Of plantains they reckon fifteen different sorts. Yams and sweet potatoes, taro-root of different kinds, and various other edible roots and fruits, are abundantly produced; to which missionaries and others have added the orange, pine-apple, the grape, and various culinary vegetables of Europe.

The animals found on the island were hogs, dogs, and rats. Horses, horned cattle, and goats have been introduced. Common poultry are abundant, and the woods supply wild pigeons and parrots.

The colour of the natives is that of olive or light copper. The men are above the middle size; the chiefs are almost uniformly tall, muscular, and well limbed, measuring from 5 feet 9 inches to 6 feet 4 inches, and continue healthy and vigorous to a good old age. The women of the upper ranks are likewise tall, with limbs finely turned. Their skins are soft and delicate; their eyes black, sparkling, and full of expression; their teeth beautifully white and even; their hair jet black, and generally ornamented with flowers; and in their gait they are firm, but easy and graceful. Their language, their deities, and superstitious observances resemble those of the other races in Eastern Polynesia, and have been repeatedly described.

The early visits of the European navigators to these islands produced no advantages whatever to the inhabitants, who were only contaminated by the vices, without participating in the blessings, of civilized life. In the year 1796 the London Missionary Society sent out their first missionaries to Tahiti, their object was to communicate the knowledge of Christianity to the natives, who gladly received them, as well as several others who were afterwards sent out in the year 1800. Their prospects were for a long time uncertain or unpromising, and they laboured with very little success to draw the attention of the natives from their cruel rites and superstitions to the purer faith of the gospel. About the year 1814 they began, however, to make some converts. In the neighbouring island of Eimeo, about fifty persons voluntarily renounced idolatry, and embraced Christianity. Pomare, the king, was among their earliest converts. These first converts were continually increased by new accessions, until the great body of the inhabitants, as well as those in the neighbouring islands, embraced Christianity. They now assemble regularly for public worship, decently attired, in congregations of four or five hundred, and occasionally eight hundred or a thousand persons. Along with religion, they have been instructed in mechanical trades of Europe; they are taught to read, write, and to cast accounts, the natives with singular industry teaching each other. Great numbers have been taught to read in the Tahitian language, which the missionaries have reduced to writing, and into which the Scriptures have been translated. A great reformation followed the propagation of Christianity throughout the islands; the profligate practices of the Arreoi societies were abolished, and many of the improvements of civilized life were adopted. The dwellings of the chiefs have been enlarged and beautified; a distinct house has been assigned to each family, in place of their being, as formerly, all crowded into one. Schools for girls have been established by the wives of the missionaries, where instruction is given in sewing, in reading, and writing. In these accomplishments many of the females have made considerable proficiency; and since 1815 reading and writing has become general among the natives. Pomare, the king of Tahiti, and the first convert to Christianity, was born about the year 1774. He died in the year 1821, and was immediately succeeded by his son Pomare III., who was crowned in 1824, being then only four years of age. Shortly afterwards he was placed at the South Sea academy in the island of Eimeo, for the purpose of receiving, with the children of the missionaries, an English education. He died in 1827, and was succeeded by a daughter of Pomare II., who is still nominally the sovereign of Tahiti.

---

[1] Darwin, in his *Naturalist's Voyage*, has given an interesting account of the mountain scenery and vegetation of Tahiti, p. 406.

The missionaries experienced, after the gloss of novelty had worn off their religion, a considerable defection of their proselytes, and for a time their fair prospects of usefulness were overcast. At first the natives appeared zealous in their attachment to the Christian creed, and schools and congregations multiplied in all quarters. In a short time, however, the people began to relapse into their former evil practices; and the letters of the missionaries themselves contain a full and candid account of these defections. Many of the converts, they observe, grew weary of the restraints which Christianity imposed on their passions; and the introduction of ardent spirits, the licentious example and the debauchery of the European sailors when vessels touched at the islands, the propagation of delusions among the people by visionaries, and finally a bloody war which broke out in Tahiti, completed the corruption and the defection of many converts. The missionaries spared no pains to counteract this tendency to vice. They established throughout the island temperance societies, and prevailed on the chiefs to restrain the importation of spirits. The Queen Pomare and most of the chiefs, who show an ardent desire for the instruction of the people, joined these societies, and countenanced the efforts of the missionaries, who have in some degree succeeded in stemming the torrent of profligacy which was inundating these countries, and was fast sweeping away all traces of that purer morality which had been planted among the natives. But even after all the defections that have taken place, a letter, dated April 1836, mentions that there were two thousand natives in church-fellowship; that two-thirds of the people could read; that a great number had learned to write; and that the schools and chapels were well attended. A letter from one of the missionaries mentions that he had seen Queen Pomare in the midst of a group of little girls, teaching them words of one and two syllables.

A great step in the progress of improvement has been the commencement of trade and manufactures. A knowledge of useful arts, such as rope-making, turnery, carpentry, and the art of working in iron, had been introduced. Some were employed as smiths, others in the preparation of lime, and in the construction of neat and comfortable dwellings, and also in boat and ship building, in which many of them are adepts.

They also began to carry on commerce. A number of small vessels built by the natives, of from 20 to 35 tons burden, were employed in fetching from a group of islands situated 200 or 300 miles eastward, cargoes of pearl-shell, which they dispose of to the English and American traders.

Such were some of the results of nearly fifty years of self-denying labour, when, instigated by Romish priests and the misrepresentations of an unscrupulous adventurer, who persuaded the French officers to constitute him consul for their nation, the French, under the name of a protectorate, took forcible possession of Tahiti and its dependencies. The defenceless queen appealed in vain to Europe for the restitution of her country, and her people defended themselves for two years; but being at length betrayed into the hands of the French, resistance ceased, and these islands have since been, in their policy, commerce, educational and religious institutions, under French rule and authority, as already noticed.

Austral Islands.

Besides Eimeo and the rest of the Georgian group, there are to the south of Tahiti a number of islands, designated the *Austral Islands*. The principal of these—Raivavai, Tubuai, Rurutu, Rimatara, and Rapa—are hilly and well watered. Missionaries have visited them, and Christian teachers have instructed the people, who profess themselves Christians, and have been taught to read. Ships occasionally call for refreshments, and shipwrecked mariners have experienced from the people assistance and security for themselves and their property; but since the fall of Tahiti but few accounts of them have been received.

The Marquesas.

The Marquesas.—This cluster of islands was discovered by Alvarode Mendana in 1595, and named by him Las Marquesas de Mendoça, in honour of the viceroy of Peru. Four only are described by Quiros the pilot, under the names of La Dominica, Santa Christina, San Pedro, and La Madalena. The Spaniards anchored in a port of Santa Christina, to which they gave the name of Madre de Dios. This port is protected from the trade-wind, and has two excellent streams of fresh water flowing into it. The people are described as being an elegant race; the men and women are remarkably beautiful, in symmetry of form and gracefulness of movement surpassing all others in the Pacific, their complexions and general appearance being said to excel those of the women of Lima. Their dress consisted of a cloth made of the leaves of a palm-tree, with which they were covered from the breast downwards; and so civilly disposed were they, that a beautiful native woman seated herself by the side of Donna Isabel, the wife of Mendana, and began to fan her. But the Spaniards, as usual, found means to quarrel with the natives, and to drive them with fire-arms into the woods.

The islands are mountainous, with but little low land. The produce of the islands are hogs, fowls, fish, cocoa-nuts, sugar-canes, plantains, and the bread-fruit, which is described for the first time by the writer of this voyage.

Subsequent voyagers have made us nearly as well acquainted with the Marquesas as with Tahiti. Captain Cook visited them in 1774, and Captain Wilson in 1797. From these we know that they consist of eight in number, besides some smaller islands to the westward, which being seen by an American master of the name of Ingram, he called them *Washington's Islands.* They had previously been seen by Marchand in 1789, and may fairly be grouped as part of the Marquesas. The centre of the group may be reckoned in about the Lat. of 9. 30. S., and Long. 139. 30. W.

The manners, the religious ceremonies, the Marais, and the general appearance of the natives, are similar to those of Tahiti. To their earliest English visitors the natives appeared hospitable and gentle, but they have been frequently engaged in barbarous wars, and are reported to have been cannibals. In 1797 Captain Wilson landed a missionary amongst them, who was kindly treated, and furnished with a share of their scanty food; but after remaining little more than eighteen months in the islands he returned to England. About thirty years ago they were again visited by English missionaries from Tahiti, two of whom remained some years in the islands, though their labours appeared to be unproductive of good among the natives. The French then took possession of the islands, and placed some Roman Catholic missionaries among the people, with what result is not known. Very recently some American missionaries, with native assistants, have gone from the Sandwich Islands, and are now labouring in the northern portion of the Marquesas among the small, but in many respects deeply interesting, people by whom they are inhabited.

Easter Island.

Easter Island.—This small island, not 30 miles in length, is chiefly deserving of notice from its solitary position, its great distance from any of the islands of the Pacific, its comparative proximity to the coast of South America, and its being inhabited by a race of men who differ no more from the rest of the Polynesians than the latter do from one another,—having the same language, the same features, the same religious notions, and Marais constructed as they generally are in other islands. On the platforms of the latter are erected shapeless and uncouth masses of stone carved in imitation of the human bust, with rude faces 4 or 5 feet in length, set on trunks of 10 or 12 feet in height. Kotzebue, the last visitor to this island, looked, however, in vain for any traces of these statues on the spots where they are described by Cook and La Pèrouse.

This island is supposed to have been discovered by the bucaneer Davis in 1687, although some have contended that the Dutch admiral Roggewein was the discoverer, and he it was who gave it the name of *Paaschen* or *Easter Island*, having first seen it on the day of that feast. Its latitude is 27. 5. S., and longitude 109. 14. W.

It is not remarkably fertile; but few trees are found on it, and no running stream. The natives are very industrious in raising food for their support, which consists chiefly of bananas, taro-roots, sugar-canes, sweet potatoes, and yams. The inhabitants are about 1200 in number. By some navigators they are described as a very savage people, and by others as a mild and amiable race. The fact is, that their conduct has always corresponded with the treatment they have received from foreign visitors. Thus their decided hostility to Kotzebue, when he attempted to land on the island, was explained on his arrival at the Sandwich Islands. An American, commanding a schooner called the Nancy, from New London, had observed a vast multitude of seals on the shores of the small uninhabited island of Massafuero, to the westward of Juan Fernandez; and thinking it might turn out an excellent speculation if a small establishment were formed on the island to carry on the fishing, he therefore proceeded to Easter Island, and seized and carried off twelve men and ten women. For the first three days they were confined in irons, and were not released till fairly out of sight of land, when the first use they made of their liberty was to jump overboard, choosing rather to perish in the waves than to be carried away they knew not whither, or for what purpose. The women, who were with difficulty restrained from following them, were carried to Massafuera, but what ultimately became of these poor creatures M. Kotzebue does not relate. No wonder, then, that such practices should have driven the natives to acts of hostility against all foreign intruders.

Pitcairn Island.

Pitcairn Island is a rocky, triangular island about 5 miles in length, situated in Lat. 25. 3. S., and Long. 130. 8. W. It was discovered by Captain Carteret in 1767, celebrated on account of its having been the retreat of the mutineers of H.M.S. Bounty, and the abode of their descendants, until, more than forty years afterwards, when the descendants of the mutineers were, at their own request, removed by the British government to Tahiti, the country from which their mothers had been taken by the mutineers. The entire number amounted to 87 individuals. They were kindly received, a piece of land was given to them, and new temporary houses erected for their accommodation by the natives, and eight months' provisions left with them by the captain of the British ship in which they arrived. Soon after their arrival they were attacked by an epidemic disease, which proved fatal to twelve of their number, and this, together with the unsettled state of the island at the time, was so discouraging to the rest, that they expressed a desire to return. In order to comply with their wishes, a subscription was raised, and a small vessel chartered to convey them to their island home, where they continued leading the same exemplary moral and religious life as before until recently, when the resources of the island proving insufficient for their support, their number being 194 persons, they were, at their own request, removed by the British government to Norfolk Island. This small but fertile island is attached to the government of New South Wales, and is now appropriated to the use of the Pitcairn islanders. A resident has been appointed, with a liberal salary, to act as magistrate or governor among them. The island is salubrious and fertile, and is surrounded by reefs, yet possesses no harbour; but this will prove no insurmountable impediment to intercourse between Australia and this interesting Anglo-Polynesian community, whose future welfare all must ardently desire.

Mangareva Group, also called Gambier Islands, a cluster at the S.E. extremity of the Paumotus Archipelago, and W.N.W. of Pitcairn's Island, was discovered by the Missionary Ship "Duff," in 1797, and named by Captain Wilson, her commander, after Admiral Lord Gambier. It consists of four large islands, and several smaller ones, situated in a lagoon formed by a reef of coral, and lying between Lat. 23. 1. and 23. 15. S., and Long. 134. 49. and 135. 3. 30. W. They are all (with the exception of two sandy reef islets on the northern and western aspects) extremely steep and rugged, and obviously of volcanic origin, clothed with verdure, and for the most part with trees. The Mangareva group is, moreover, a locality well supplied with good water, than which nothing can be more important to the navigation of these seas, that indispensable article not being elsewhere found in a pure state between Tahiti and the coast of Chili (a distance of 4000 miles), except, indeed, at Pitcairn Island, whence it is difficult, and well-nigh impossible, to get it on board ship. Captain Beechy, R.N., under whose direction a survey was made of this series in 1826, states that in addition to several sorts of wood (some of a very useful description) and flowers, the group is by no means deficient in a variety of edible roots, nor in those kinds which are most productive and nutritious. Besides the ti-plant (*Dracæna terminalès*), sweet potato, sugar cane, water melon, cocoa-nut, plantain, and banana, he found on his visit that the natives possessed the bread-fruit and the taro, from both of which an abundance of wholesome food is procurable.

The Dangerous Archipelago.

The Dangerous Archipelago, or Paumotu Islands.—This vast archipelago, if not geographically and politically the most important, is, on account of its geological structure, one of the most deeply interesting, as well as the most extensive groups of Polynesia. It lies to the south of the Marquesas, and stretches from the Georgian and Society Islands in a south-easterly direction, beyond Mangareva or Gambier's Island,—thus covering an area of the ocean nearly 1000 miles in length and 600 miles in breadth. This archipelago is an immense series of groups, mostly of low coralline islands, more or less detached from each other. Most of them are lagoons, and the majority of them rising but a few feet above the level of the sea at high-water. Oana or Rairoa is 46 miles long and 20 miles broad; it is inhabited by a quiet people. Ilao or Bow Island is 34 miles long and 10 miles broad. The lagoon which it surrounds is generally about 20 fathoms deep, and abounds with the pearl oyster. The ring-like shore of the lagoon is covered chiefly with cocoa-nuts: the inhabitants are about 100. The other islands are generally smaller, but some of them much more populous; and many of them are clothed with cocoa-nut trees. Navigation amongst them is exceedingly perilous, on account of the numerous reefs which are found in every direction. Their native name Paumotu, which signifies islands of shallow water, indicates the peril to large vessels. They are also called the Pearl Islands, on account of the large quantities of mother-of-pearl shell found amongst them. Most of them are inhabited, chiefly by the Malayo-Polynesian race; and some of those nearest to Tahiti have become Christians through the exertions of native missionaries from the latter island.

But, curious, attractive, and deeply interesting as these labyrinths of islands are,—seeming like so many rings of coral and sand scarcely higher than the long swelling billows of the wide ocean in which they rise, and each inclosing a smooth placid lake of comparatively shallow water; and covered as they are for the most part with waving palms, beneath which the almost amphibious native builds his hut, and in this isolated home begins and ends his days,—the agencies by which these wondrous structures have been raised, the vast extent over which they have been spread, and the records they exhibit of the changes that have taken place in the surface of our globe are among the wonders of the world we inhabit. These innumerable and gigantic structures are the work of small marine animals of several different kinds, which separate calcareous substances from the sea, and with it rear, in all their varied and often beautiful forms, these marvellous structures. According to the theory of Mr Darwin, who traversed a large portion of this region in 1835, with Captain (now Admiral) Fitz-Roy in H.M.S. Beagle, these reefs, which sometimes surround like a fringe existing islands, or stretch like a barrier in a line parallel with a coast, and at unequal distances from the shore; or surround like a circular breakwater, at a distance of 3, 5, or more miles, a mountainous island; while others rise like a ring from the depths of mid-ocean, and inclose a lake of calm and shallow water,—all these have been formed by one uniform process, and in obedience to one invariable law. Mr Darwin, it appears, supposes that where fringed reefs exist, the land to which they are attached slopes gradually down below the water, and is subsiding, but that as the land subsides the corals rise to the surface; that where there are barrier reefs or circular breakwaters at a distance from the present existing land, the whole land has gradually subsided. The coral-building insects, which are most vigorous on the outside of the reef, or the part next the ocean, rearing their encircling walls higher and higher as the foundations sink lower and lower, and then in the atolls or lagoon islands, which present a ring-like reef inclosing a smooth lake, the land has subsided entirely beneath the level of the ocean, while, as it sank, the myriads of marine architects continued to keep their outer wall up to the level of its waves. It has been found that the reefs never rise above the level of the sea, and that the building animals do not live at a greater depth than from 20 to 30 fathoms; so that, as the coral structures have gradually subsided to that depth, their inhabitants have died, and their cells have become their graves, and a new generation has carried on the structure up again to the surface of the waves, to give place, as the foundation subsided, to succeeding generations. Such appears the outline of Mr Darwin's theory. What vast changes must be in progress when an area of subsidence so large as that covered by this archipelago is considered; but how much more astonishing when we consider that, from this archipelago single islands stretch in a north-westerly direction to the Radic chain; that these two archipelagos on opposite sides of the equator indicate a line of subsidence in mid-ocean of "more than 4000 miles in length, in which not one single island rises above a specified height!" In closing his account, Mr Darwin observes:—"The reef-constructing corals have indeed reared and preserved wonderful memorials of the subterranean oscillations of level; we see in each barrier-reef a proof that the land has there subsided, and in each atoll a monument over an island now lost." (*Voyage of a Naturalist*, p. 482.) (W. E.)

POLYPHEMUS, King of the Cyclops in Sicily, was the son of Neptune and Thoosa. (See CYCLOPS.)

POLYPLECTRON (from the Greek πολυ, *much*, and πλῆκτρον), a musical instrument invented by Dietz about thirty years ago, and played upon in the manner of a pianoforte. Its sounds are produced by the friction of numerous narrow slips of leather made to revolve upon a cylinder and over pulleys, and brought into contact with the strings by pressing down the finger-keys. The powers of this instrument were highly commended by Prony, Savart, Cherubini, Paer, and others after they had made trial of it on the 11th of July 1828. According to the touch, firm and *legato*, or light and *staccato*, the quality of the tone varied. The lower sounds and medium ones closely resembled those of the double bass, violoncello, and viola. Dietz had not succeeded in imitating the sounds of a violin. The *orchestrino* of Poulleau, and some other instruments on the same principle, preceded Dietz's polyplectron. (G. F. G.)

POLYTHEISM (πολύς, *many*, θεός, *God*), the doctrine of a plurality of gods. This word, although not used by Greek writers, differs from idolatry with respect to the *forms* of the object worshipped. Polytheism refers to a plurality of gods, without including, of necessity, the notion of *forms;* whereas idolatry refers either to one God only, under some visible form, or to any number of gods under as many visible forms. No one taking the Bible for his guide will believe that men were polytheists before the flood; but it is plain that men had embraced this doctrine in the time of Moses (1500 B.C.) The ancient Persians, so far as we are aware, became first Sabians, or worshippers of the host of heaven, and afterwards Magians, or worshippers of fire. According to the latter view, they held that Ormuzd was the principle of light and the cause of all good, and that Ahriman was the principle of darkness and the cause of all evil. The Egyptians in Moses' time were polytheists, and not a few of the provisions of the law were designed to guard the Israelites against the polytheism and idolatry of Egypt. The Greeks and Romans acknowledged one being, Zeus or Jupiter, as superior to the other deities, but nevertheless they bound him hard by the absolute control of Fate. Yet the lesser deities were worshipped as gods, and the system was essentially polytheistic. Cudworth has laboured very ingeniously to show that the ancient philosophers in general worshipped mentally but one Supreme Being under different names. But granting the truthfulness of this doctrine, it only establishes with greater solidity that the people were polytheists; and as Philo-Judæus has it, "Polytheism in the mind of the ignorant is atheism." Wherever the Christian religion has been established, polytheism has disappeared; but there still remains vast portions of territory where polytheism still prevails. (See MYTHOLOGY.)

POMBA, VILLA DA, a town of Brazil, in the province of Minas Geraes, on the River Pomba, an affluent of the Parahiba, 60 miles E.S.E. of Ouro Preto. It has a church and town-hall; and most of the inhabitants are employed in the cultivation of the sugar-cane. Some trade is carried on in sugar, rum, &c. Pop. of the district, 12,000.

POMBAL, a town of Portugal, in the province of Estremadura, stands on a hill near the Sora, 20 miles N.E. of Leiria. It contains the ruins of a castle, and of a church of the Templars, and three modern churches. Hats are manufactured here; and large markets are held weekly. Pop. 5000.

POMBAL, MARQUISE DE, DOM SEBASTIAO JOSÉ DE CARVALHO, a celebrated Portuguese statesman, was born in 1699 at Soura in Coimbra. As he advanced towards manhood he appeared in the character of an accomplished votary of fashion. His tall, handsome, and animated figure fascinated every eye; and his easy, agreeable, and intelligent address captivated every heart. No dissipation impaired his robust constitution, and no pleasure palled upon his strong and healthy appetite. Life, in fact, seemed to him to be a gay pageant, where a man was required to play his part not from a sense of duty, but merely for his own amusement. He attempted to study law at Coimbra, but his highly pampered tastes revolted at the dry and heavy nutriment of jurisprudence. He then entered the royal guards, but his mettlesome spirit could not brook the restraint of military discipline. His last resource was to elope with a wealthy widow, and to live in indolent privacy upon her fortune until circumstances occurred to draw him into active life. In 1739 Carvalho, through the influence of his uncle, a canon of the royal chapel at Lisbon, commenced the preparatory steps of his political career by being appointed ambassador extraordinary to Great Britain. The ability which he displayed recommended him in 1745 to the office of plenipotentiary at the court of Vienna. He returned from that post to find that he had improved his prospects by contracting a second marriage with the young Countess of Daun. The queen-dowager of John V. conceiving an attachment for his wife, recommended him to the notice of her son Joseph I. Accordingly, in 1750, the year of that prince's accession, he was raised to the congenial office of secretary for foreign affairs. The determined efforts which he put forth to rouse the country from its lethargy began to make a favourable impression upon the king. His promptitude, activity, and address in allaying the universal distraction caused by the earthquake of 1755 completed the impression; and in the following year he was created prime minister of the kingdom. Carvalho, thus raised to the very summit of his political ambition, ably engrossed the virtual sovereignty, and commenced to rule the Portuguese with a rod of iron. His first acts were directed to the utter and merciless extermination of all those abuses that clogged or obstructed the national prosperity. No grievance, however highly connected and time-honoured, met with any quarter. His edicts went through the land smiting and crushing their victims with blows as summary and remorseless as those of Destiny herself. The desperadoes who plundered and murdered on the midnight streets of the capital were shot down on the spot. The proprietors who refused to raise corn on their lands had their vineyards torn up by the roots. The Jesuit confessors who abused the ear of the sovereign with their wily and selfish schemes were turned out of court. The self-seeking magnates who mismanaged the affairs of the state were removed from their snug sinecures to prisons prepared expressly for them. It was to no purpose that the parties smarting under these stripes sent forth a murmur of indignation and discontent. A decree was forthwith issued daring any one to speak against the measures of the government on pain of capital punishment. It was to no purpose that an attempt was made to assassinate the king on the night of the 3d September 1758. The minister's policy only assumed greater rapidity, force, and decision. No compunctions deterred him from pouncing upon some of the principal nobility as accomplices in the treasonous crime. The Duke of Aveiro was broken on the wheel; his sons and his servants were strangled; and all the dead bodies were consigned to the flames. Suspicion then fell upon the Jesuits; and they were commanded as rebels and traitors, to quit the country in a body. On refusing, they were seized by the military, shipped to the number of 1854, and landed in the States of the Church. After this thorough-going manner were the impediments to advancement destroyed or removed out of the way. Nor while Carvalho was eradicating old abuses did he fail to introduce improvements. It was his great aim to draw out the torpid energies of Portugal into a full and healthy development. Accordingly, he set on foot a system of universal education. The Portuguese, both at home and in the colonies, were instructed in the cultivation of new kinds of crops. Englishmen and Frenchmen were employed to teach the people navigation and ship-building. Special schools were established to train the young for the pursuits of industry and commerce. At the same time, the discipline of the university was investigated; the physical and mathematical sciences were introduced into the course of study; and every facility was furnished to the students for acquiring information, both practical and theoretical. For so many public benefits it was natural that Carvalho should be bountifully rewarded. Accordingly pensions and estates were lavished upon him; the title of Marquis of Pombal was added to his name; and the government of the country was more and more completely entrusted to his charge. He was still continuing to hold undisputed possession of the royal favour when the death of Joseph I., in 1777, left him exposed to the malice of his many enemies. Pombal, however, maintained his heroical bearing to the last. His foes, indeed, closed in around him, clamouring for his head; but he entrenched himself behind the prerogative of the deceased sovereign, and dared them to punish him for simply executing the commands of his royal master. Leaving court unharmed, with all his titles and wealth, he lived in dignified retirement till his death in May 1782.

POMERANIA (Germ. *Pommern*), a province of Prussia, lying between N. Lat. 52. 58. and 54. 50., E. Long. 12. 30. and 18. 2.; bounded on the N. by the Baltic, E. and S.E. by the province of West Prussia, S. by that of Brandenburg, S.W. and W. by the grand duchies of Mecklenburg. Its length from E. to W. is upwards of 200 miles, its breadth varies from 30 to 80, and its area is 12,221 square miles. It is entirely low and flat, with a few hills in some parts. The largest river that flows through Pomerania is the Oder; but the province contains only a small portion of its course. After entering the country, it separates into two branches, the larger, towards the left, retaining the name of Oder, and the other taking that of Reglitz. The latter spreads itself out east of Stettin into the Lake of Damm; then again contracts, and, re-uniting with the Oder, expands, first into the Papenwasser, and then into the Pomeranian Haff, from which it falls into the Baltic by three mouths. East of the Oder there are a number of small rivers, flowing generally from lakes in a N.W. direction to the Baltic. The chief of these are the Rega, Persante, Wipper, Stolpe, and Leba. The largest river west of the Oder is the Peene, which flows N.E. from Mecklenburg-Schwerin. The coast of Pomerania is generally low and shallow; and the land is only protected from the overflow of the water by sand-hills or artificial dykes. Several sheets of water are formed at the mouths of the rivers, separated from the sea by narrow stripes of land. The largest of these is the Pomeranian Haff, or gulf, at the mouth of the Oder. The island of Rügen, separated by a narrow strait from the mainland, belongs to Pomerania. The principal lakes in the province are those of Vilm, Pileborg, Lübbe, Plöne, and Madine. The soil is generally good, especially along the Baltic coast and near the lakes of Plöne and Madine; in other parts it is of inferior quality. In some places there are extensive moors and bogs. Pomerania contained in 1852, 3,474,252 acres of arable land, 1,680,981 acres of pastures and meadows, 1,359,891 acres of forests, and 1,237,313 acres of waste land. Agriculture is well managed; and the produce in favourable seasons is somewhat more than the wants of the people. There were in the province in 1855, 150,241 horses, 450,637 horned cattle, 2,651,030 sheep, 182,992 swine, and 27,263 goats. Deer, hares, and other kinds of game are found in Pomerania; and fish abound in the lakes and rivers. Iron, salt, and alum are the only minerals found in the country. Manufactures are extensively carried on here; the most important establishments in 1852 were 16 paper-mills, 14 tanneries, 249 breweries, 258 distilleries, 16 iron-works, 11 glass-works, and 13 manufactories of porcelain; besides many cotton and woollen factories. There is a considerable trade in corn. Ship-building is carried on in the coast-towns. The great majority of the population belongs to the Reformed Church; but there were also in 1855, 11,577 Roman Catholics, and 11,336 Jews in the province. Education is well attended to in Pomerania, as in other parts of Prussia. The province contained in 1852, 9 gymnasia, with 124 teachers and 2018 scholars; 6 normal schools, with 124 scholars; 124 middle schools, with 432 teachers and 17,777 scholars; and 2489 elementary schools, with 2923 teachers and 497,697 scholars. There are also many benevolent establishments in the country.

The country between the Oder and the Vistula was inhabited in the earliest historical period by the German tribes of Sueves and Vandals; but these people gradually migrated southward; and about the end of the fifth and beginning of the sixth century, the Wends, a Slavonian nation, settled in the country, and gave it the name of *Po More* ("beside the sea"), from which the present name has been derived. The first prince of Pomerania was Mestibock, who lived about the year 960. His great-grandson Sambor died in 1107, and left four sons, who divided the country into two parts. Of these, the eastern, called Pomerellen, now West Prussia, on the extinction of its line of princes in 1296, fell to the Teutonic knights, though it was also claimed by the Polish monarchs, who more than a century afterwards obtained possession of it. The princes of the Pomeranian or elder line possessed the present province, and were in 1182 recognised as princes of the German empire (*Reichsfürsten*) and dukes of Pomerania. In 1295 the ducal line was divided into two, that of Stettin and that of Wolgast. Wratislaw IV., the second duke of the latter line, was elected in 1325 lord of Rügen, which he held as a vassal of the King of Denmark. The extinction of the Stettin line in 1464 led to a dispute between Wolgast and Brandenburg about the succession; but finally, in 1478, the whole of Pomerania was united under a duke of the Wolgast line. The Reformation was introduced at the diet of Treptow in 1534; John Bugenhagen, surnamed from this, his native land, *Pomeranus*, being the chief founder of the new church. The whole line of the Pomeranian dukes became extinct in 1637, and the electoral house of Brandenburg had, according to former treaties, the next claim on the country; but in the peace of Westphalia (1648), the whole of Hither Pomerania (west of the Oder), with the island of Rügen and part of Further Pomerania, were given to Sweden, and the rest to Brandenburg. By the peace of Stockholm in 1720, the country between the Oder and the Peene was ceded to the House of Brandenburg, which had assumed the Prussian crown; but a part of Pomerania was retained by Sweden till 1814, when it was given up to Prussia in exchange for the duchy of Lauenburg. Pomerania is at present divided into the circles of Stettin, Köslin, and Stralsund; and contained in 1855 a population of 1,288,964.

POMEROY, a town of the United States of North America, state of Ohio, on a narrow strip of land between the Ohio river and a steep rugged range of hills, 100 miles S.E. of Columbus. With the neighbouring villages of Coalport, Minersville, Carltonville, and Middleport, which are almost parts of the same town, it extends nearly 3 miles along the river. Since its foundation in 1841 the town has rapidly increased in size and prosperity, from the abundance and excellence of the coal found in the vicinity, of which 5,000,000 bushels were mined and exported in 1851. There are here salt springs of a very superior quality, and several companies have been formed for the purpose of working them; so that the salt manufactures of Pomeroy will soon be very extensive. Pop. (1853) estimated at 4000.

POMFRET, John, an English poet, son of the vicar of Luton in Bedfordshire, was born in 1667, and educated at Queen's College Cambridge; after which he took orders, and was presented to the living of Malden in Bedfordshire. About 1703 he went to London for institution to a larger and more considerable living; but he was stopped for some time by Compton, then bishop of London, on account of four lines of his poem entitled the *Choice* (1699):—

> "And as I near approach'd the verge of life,
> Some kind relation (for I'd have no wife)
> Should take upon him all my worldly care,
> While I did for a better state prepare."

But he was soon convinced that this representation was the mere effect of malice, as Pomfret at that time was actually married. The opposition which his slanderers had made to him, however, produced its effect; for, being thereby obliged to stay in London longer than he intended, he caught the small-pox, and died in 1703, at the age of thirty-five.

He published in 1699 a volume of his poems, with a very modest and sensible preface. Two pieces of his were published after his death by his friend Philalethes: one entitled *Reason*, and written in 1700, when the disputes about the Trinity ran high; and the other *Dies Novissima*, or the Last Epiphany, a Pindaric ode. His versification is not unmusical, but his writings want that force which is necessary to constitute a poet. "The *Choice*," says Dr Johnson, "exhibits a system of life adapted to common notions, and equal to common expectations; such a state as affords plenty and tranquillity, without exclusion of intellectual pleasures. Perhaps no composition in our language has been oftener perused than Pomfret's *Choice*. In his other poems there is an easy volubility; the pleasure of smooth metre is afforded to the ear; and the mind is not oppressed with ponderous or entangled with intricate sentiment. He pleases many; and he who pleases many must have some species of merit."

POMŒRIUM, is derived from *post* and *mœrium* (*murus*), and thus signifies a line running by the walls of a town. The *pomœrium* consisted of a symbolical not of an actual wall, and the course of it was marked by stone pillars. The custom of making a *pomœrium* was peculiar to the Latins and the Etruscans. It was done as follows:—"After this," says Plutarch, "the founder, yoking a bull and a cow together, ploughed a deep furrow with a brazen ploughshare round the bounds. The attendants took care that all the clods fell inwards,—that is, towards the city." This sacred line might be built beyond, but it was necessary to leave a certain space on each side of it unoccupied, so as not to unhallow it by profane use.

POMONA, or Mainland, an island of Scotland, the largest of the Orkneys, lies about the centre of the group. It is about 20 miles in length, and its breadth varies from 3 to 15; area, 150 square miles. In shape it is very irregular, being penetrated on all sides by arms of the sea, so that no part of the land is more than 4 or 5 miles from the sea. The western and north-western coasts are steep and lofty; the waves of the Atlantic roll in and dash upon the rocks with such violence that several remarkable caves have been hollowed out by them. The surface gradually slopes towards the south-east, and is diversified with hills and valleys, though bare of trees, and consisting chiefly of moors and mosses. There are, however, sheep pastures and some fertile tracts of ground. The geological structure of the greater part of the island is old red sandstone, containing many fossil fishes. There are also some dykes of whinstone, and a range of granite hills, forming a promontory on the west coast. Oats, beans, and bere are the crops principally raised on the island. Grouse, plover, and other kinds of game abound here, as well as fish. The island has several good harbours, and the only towns in Orkney, Kirkwall and Stromness. It is divided into 13 parishes. Pop. (1851) 16,757.

POMPEII, an ancient city of Italy, situated in that part of the country to which the ancients gave the name of Campania. It lies at the bottom of the Gulf of Cumæ, known in modern times as the Bay of Naples, 5 miles from the volcanic mountain of Vesuvius, and 13 miles S.E. of the city of Naples. Of the early history of Pompeii little is known. It is said to have been founded by Hercules, and that its name is derived from Pompa, in allusion to the pomp with which that hero celebrated his victories whilst awaiting his fleet at the mouth of the river Sarnus (*Sarno*) after his reputed conquest of Spain. This refuge in mythology, to which men have betaken themselves in accounting for the origin of Pompeii, is a sufficient proof that the obscurity in which it is hidden is too profound to be penetrated. Strabo, however, asserts that these towns were first founded by the Oscans, afterwards by the Pelasgians and Tyrrhenians, and subsequently by the Samnites; and this statement is by no means destitute of plausibility. The early history of the city is nearly as uncertain as the date of its foundation and the etymology of its name. It is first mentioned in B.C. 310. And the next account we have of it is in the Social or Marsic War, which broke out 91 years before the birth of Christ, as one of the towns of Campania that had revolted. It escaped the punishment with which some other places were visited; and the only subsequent event of any moment which is related of it is a quarrel between its inhabitants and those of Nuceria (now *Nocera*), in which the latter were worsted. This transaction occurred A.D. 59. Four years afterwards Pompeii was almost destroyed by an earthquake, the terrible effects of which are recorded by Seneca. A great part of the town was reduced to ruins; and Herculaneum was likewise considerably injured. Similar alarms, the usual presages of an approaching eruption, were repeated, until the memorable 23d of August A.D. 79, when the first recorded volcanic paroxysm of Vesuvius occurred. We are fortunately in possession of a faithful and striking narrative of the event, contained in two letters of Pliny the younger to Tacitus. He was an eyewitness of the catastrophe; and, besides a description of it, he gives an account of the death of his uncle, who fell a victim to his inquiring spirit and humanity.

It was not lava, but showers of stones, cinders, and mud, which overwhelmed Pompeii; pouring down for more than a week, and much of the matter having been deposited in a liquid state. Nor was it by one eruption alone that the cities were covered to their present depth. Successive layers are clearly to be traced, and the lowest bears marks of having been moved, whilst the others are untouched; a plain proof that some time elapsed between their deposition, and that the inhabitants had made excavations in search of their more valuable property. The bed of ashes and stones which covered Pompeii varied in depth from 12 to 14 feet. Under this it remained for 1676 years; for although indications of its ruins were observed in 1689, the excavations did not commence till 1755. The disappointment experienced on the failure of the attempt to excavate Herculaneum to any extent has thus been compensated; for whilst the thick layers of lava which covered the latter city rendered the undertaking too difficult to be persevered in, the light friable mass which entombed Pompeii was easily removed. The upper storeys of the buildings, which were probably composed of wood, were either burned by the red-hot matter which fell upon them, or forced inwards by the weight of the enormous superincumbent mass, or the violence with which it descended. With this exception, we see a beautiful and once flourishing city just as it existed nearly eighteen centuries ago. The buildings stand as they were originally designed, unviolated by time or fashion; and in some instances memorials of a more impressive character bear sad testimony to the suddenness and completeness of the calamity which overwhelmed the city.

Pompeii was originally situated upon the sea-shore, as is proved by shells and sea-sand being found on the side adjoining the Bay of Naples; and it is even said that rings have been discovered close to the ruins, intended, as is supposed, for the mooring of vessels. By the gradual elevation of the coast, it is now at some distance inland; and the river Sarnus (*Sarno*), which, it is not improbable, was once capable of receiving the vessels of the ancients, has shrunk to a mere rivulet, and is diverted from its original course. The city stood on an insulated spot formed by the lava which, at some remote period, the action of subterranean fire seems to have thrown up in various directions around the foot of Vesuvius. Thus situated, it combined all the advantages of mercantile convenience with the security of a military station, and the romantic beauty of a spot celebrated in all ages for its surpassing loveliness, and which was a favourite resort of strangers for health or recreation. The city was surrounded by a wall, the whole, or nearly the whole, of which has been traced; and six gates and twelve towers have been counted. Its greatest length is little more than three-quarters of a mile, its breadth is less than half a mile, and its circumference is nearly two miles. Its general figure is irregularly oval, and it occupied an area of about 161 acres. There have been excavated above eighty houses, an immense number of small shops, the public baths, two theatres, two basilicæ, eight temples, the prison, the amphitheatre, and other public buildings, besides fountains and tombs. The streets are paved with large irregular pieces of lava, neatly dovetailed into one another. This pavement had been deeply rutted by the chariot-wheels which formerly rattled over it In general, the streets are so narrow that they may be crossed at one stride. Where they were of greater breadth, a stepping-stone was placed in the middle, it is supposed for the convenience of foot-passengers. On each side there is a footpath, along which run curb-stones to prevent the encroachment of the chariot. From the position of the town, and the discoveries made by the excavators, it seems clear that only three principal roads could have led to it. The first, which was on the western side, led to Naples; the second joined the Popilian Way at Nola; and the third crossed the Sarnus, and afterwards divided into two branches, of which the principal led to Nocera, and the other to Stabiæ. The city is generally approached by the first road, because it was the ancient route from Rome to Herculaneum, and the chief entrance of Pompeii. The first object of interest met with is the Street of Tombs, now completely excavated, which rises by an easy ascent to the city gate, called the Gate of Herculaneum. The road is flanked by tombs of much beauty and interest, as well as by other buildings, amongst which is a hostelry. We quote the following description of Pompeii, as entered by this gate, from an interesting work on the subject:—"On entering, the visitor finds himself in a street running a little east of south, which leads to the Forum. To the right stands a house formerly owned by a musician, to the left a *thermopolium*, or shop for hot drinks; beyond is the house of the vestals; beyond this the custom-house; and a little further on, where another street runs into this one from the north, at a very acute angle, stands a public fountain. In the last-named street is a surgeon's house, at least one so named from the quantity of surgical instruments found in it, all made of bronze. On the right or western side of the street by which we entered the houses are built on the declivity of a rock, sloping down to where the sea formerly came, and are several storeys in height. The fountain is about 150 yards from the city gate. About the same distance farther on the street divides into two, the right-hand turning seems a bye-street, the left-hand turning conducts you to the Forum. The most important feature in this space is a house called the house of Sallust, or of Actæon, from a painting in it representing that hunter's death. It stands on an area about 40 yards square, and is encompassed on three sides by streets, —by that, namely, which we have been describing, by another nearly parallel to it, and by a third perpendicular to these two. East of this island of houses is an unexcavated space, beyond which is another broad street running parallel to the first, the limit of the excavations in this quarter. Between these two are indications of another street, which is cleared out, south of the transverse street. Still farther south these streets all terminate in a transverse street. Thus the whole quarter already described is divided by four longitudinal and two transverse streets into what the Romans called *islands*, or insulated masses of houses. One of these is entirely occupied by the house of Pansa, which, with its court and garden, is about 100 yards long by 40 wide. The average interval between the western and eastern street is not more than 150 yards. The island immediately east of the house of Pansa has three houses of considerable interest, called the house of the tragic poet, from dramatic paintings on the walls; the cloth-dyer's house, from paintings illustrating the processes and utensils of that trade; and the house of the mosaic fountains.

"From the transverse street which bounds these islands on the south, two streets lead to the corners of the Forum; between them are the baths, occupying nearly the whole island. Among other buildings are a milk-shop and gladiatorial school. At the N.E. corner of the Forum was the triumphal arch. At the end of the broad eastern street, and higher up in the same street, another triumphal arch is still to be made out; so that this was plainly the way of state into the city. The Forum was distant from the gate of Herculaneum about 400 yards. Near the south-eastern corner two streets enter it, one running to the south, the other to the east. We will follow the former for about 80 yards, when it turns eastward for 200 yards, and conducts us to the quarter of the theatres. The other street, which runs eastward from the Forum, is of more importance, and is called the Street of the Silversmiths. . . . The quarter of the theatres comprises a large temple of Hercules, a temple of Isis, a temple of Æsculapius, two theatres, and two spacious porticoes inclosing open areas. On the north and east it is bounded by streets; to the south and west it seems to have been inclosed partly by the town, partly by its own walls. Here the continuous excavation ends, and we must cross nine yards to the amphitheatre, distant from the theatre about 550 yards, in the S.E. corner of the city, close to the walls, and in an angle formed by them. On the other side are traces of walls, supposed to have belonged to cattle-markets. Near at hand a considerable building, called by the Italians the palace of Giulia Felice, has been excavated and filled up again. A considerable distance to the westward is the first excavation, made near the centre of the city; it is surrounded by vines, which hang in festoons from the poplars on which they are trained; it is small, and appears to have been abandoned on account of the few coins and vessels discovered. From the amphitheatre we return along the Street of Silversmiths towards the Forum; but before we arrive at the latter, turn up a street running parallel to it. Arriving at the end of it, we turn to the right, and soon reach the triumphal arch of the Forum, having now traversed the whole excavated portion, except a few insignificant streets."

This account of the general aspect of Pompeii renders it less necessary to give any description of particular places and buildings. The Forum was the focus of business, the resort of pleasure, and the scene of all political and legal contention. Entering at the gate of Herculaneum, the main street of the town leads the visitor to the N.W. corner. Here he gains admittance by a flight of steps leading downwards through an arch in a brick wall. Upon entering, the spectator finds himself in a large area surrounded by columns and the ruins of temples, triumphal arches, and other public buildings, the particular uses of which can in general be only conjectured. There are also a number of pedestals, which once supported statues; and around the west, south, and east sides there runs a Doric colonnade in the Grecian style. At the end by which the place is entered stands a building, called by some the temple of Jupiter, and by others the Senaculum, or council-chamber. It is prostyle, and of the Corinthian order, and stands upon an elevated basement, which was ascended by a flight of steps. Those near the columns, which served for ornament, and also for supporting the upper part of the building, run along the whole front of the portico. The interior had been painted; red and black are prevailing colours. Fragments of a colossal statue and a sun-dial were discovered. Near this temple are the ruins of what has been conjectured to have been the granary. Adjacent to this building is the prison, where were found the skeletons of two men, their leg-bones still within the shackles. On the opposite side of the temple of Jupiter stands an edifice which has been called the Pantheon, from its having had in the centre of its area an altar encircled with twelve pedestals, and which, it is supposed, once supported statues of the aristocracy of Italian mythology. The area is 120 feet in length by 90 feet in breadth. To this building are attached numerous cells, in all probability for the accommodation of priests. Near to this building were discovered 93 brass coins and statues of Nero and Messalina.

On the northern side of the Pantheon there runs a street named the Street of Dried Fruits, from the quantity of fruits of various kinds preserved in glass vases which have been found in it. Scales, money, and moulds for pastry and bread were discovered in the shops; and a bronze statue of Fame was also found. On the western side of the Forum are the Basilica, a temple supposed to have been dedicated to Venus, and the granary and prison already noticed. The Basilica, or court of justice, is the largest building in Pompeii. It is of an oblong form, 220 feet in length by 80 feet in breadth, and corresponds in some particulars with the ancient description of that building. The temple of Venus is the only remaining building of importance connected with the Forum. It possessed the usual apartments, in one of which was found a painting of Bacchus and Silenus in a state of perfect preservation. In most of the paintings the colours are as vivid as when they were first laid on.

Amongst other objects of interest, there is a broad street, which, from various articles of jewellery having been found there, is called the Street of the Silversmiths. On the walls of the shops several inscriptions appear, one of which has been thus translated:—"The scribe Issus beseeches Marcus Cerrinius Vatia the ædile to patronize him; he is deserving." At the end of this street was discovered a skeleton, supposed to have been that of a priest of Isis. In the hand was a bag of coarse linen, not entirely destroyed, containing 360 silver coins, 42 of copper, and 6 of gold. Near him were also found various articles belonging to the worship of Isis.

The baths of Pompeii were excavated in the year 1824. They surpass all the other buildings of Pompeii in magnificence, decoration, good taste, arrangement, and the state of preservation in which they remain. They occupy a considerable space, and are divided into three separate compartments; one was for fire-places and for the use of servants, another was for the men, and a third for the women. The walls of the *frigidarium* are ornamented with figures; and the apartment is round, and altogether remarkable for its beauty. The basin is 12 feet 10 inches in diameter, and 2 feet 9 inches deep, and is entirely lined with white marble. The *tepidarium* is divided into a number of compartments, and has also been highly ornamented. The ceiling is adorned with figures and carvings in stucco. In the bronze frame of the window were four beautiful panes of glass, from which it is evident that windows of glass were in use amongst the ancients. Glass-blowing seems to have been better understood by them than many of the learned are inclined to admit. This is proved by the quantities of bottles, vases, glasses, and other utensils made of the same material, which have been discovered in this subterranean city. The *caldarium*, the third and last description of bath made use of by the Romans, is an apartment in all respects as highly finished and decorated as the others.

Two theatres have been excavated in Pompeii, a large one and a small one, both displaying the remains of considerable magnificence. They are constructed after the usual plan of a Roman theatre, and need not therefore be described here. In the large theatre there must have been sufficient space for 5000 persons. This theatre appears to have been entirely covered with white marble, although only a few fragments remain. The other theatre nearly resembles the one here mentioned, but is much smaller, was capable of holding 1500 spectators, and appears from an inscription to have been permanently roofed.

Adjoining the theatres there is an edifice which, from the style of its architecture, has been called the Greek temple, or the temple of Hercules. It is supposed by some to be of great antiquity, and is in a very dilapidated state. In this quarter also is situated the temple of Isis. It is also one of the most perfect examples now extant of the parts and disposition of an ancient temple. In one of the rooms was found the skeleton of a priest. Near his remains lay an axe, from which it would appear that he had delayed his departure till the door was choked up with the falling ashes, and so had attempted to force his way through the walls with the hatchet. He had already penetrated through two, but before he could break through the third, death arrested his flight. A number of other skeletons were here found, and also some paintings of the priests of Isis, together with a statue of the deity herself. In this neighbourhood stands the temple of Æsculapius, where were found three terra-cotta statues of Æsculapius, Hygeia, and Priapus. Near this is one of the most interesting buildings discovered in Pompeii, not for its beauty, but for its contents, which prove it to have been the abode of a sculptor. There were found statues, some half finished, others just begun, with blocks of marble, and all the tools required by the artist, as mallets, compasses, chisels, saws, and the like. The amphitheatre, which has been excavated, does not differ from other Roman buildings of the same kind. It was calculated to contain 10,000 persons.

In a street which conducts to the Forum, and is called the Street of Fortune, an immense number of utensils have been found. Amongst these were vases, basins and handles, bells, elastic springs, hinges, buckles for harness, a lock, an inkstand, gold ear-rings, a silver spoon, an oval caldron, a saucepan, a mould for pastry, a number of lamps (about 1000 were found at the baths), and three boxes with a slit to admit money, one of which contained coins of Titus Vespasian and other Roman emperors. Here also were found seven glazed plates packed in straw, a pair of scales, and a steelyard. In other parts of the city were discovered fishing-nets, some of them quite entire, and linen with the texture well defined. In the shop of a baker there was found a loaf, still retaining its original form, and with the maker's name stamped upon it. On the counter of an apothecary's shop lay a box of pills, and by the side of it was a small cylindrical roll, evidently waiting to be cut up. This mode of administering medicine, therefore, is of very high antiquity. In various parts of Pompeii have been dug up a number of bronze helmets, greaves, and other warlike furniture; more than one candelabrum, braziers of various sorts, vases, cooking-vessels and other kitchen utensils, glass vessels, articles of dress, female ornaments, and other articles of luxury.

But the relics most calculated to interest our feelings are the remains of the human beings who perished in the great catastrophe. A comparatively small number of skeletons have as yet been brought to light; and hence it is clear that most of the inhabitants had found time to make their escape. Besides those already mentioned, there were discovered in the vaults of a house in the suburbs of Pompeii the skeletons of seventeen individuals, who appear to have sought in vain an asylum there from the tempest of ashes which poured down from the sky. There was likewise preserved in the same place a perfect cast of a woman, supposed to have been the mistress of the house, with an infant locked in her arms. Her form was imprinted upon the consolidated mass in which she was entombed, but of her body only the bones remained. To these a chain of gold was suspended, and rings with jewels were upon the bones of the fingers. The remains of a soldier were found in a niche, where in all probability he was performing the office of sentinel. His hand still grasped a lance, and the other military accoutrements worn at the time were found beside him or upon his bones.

The architecture of Pompeii is not always in the best taste; yet there is much to be admired in it, both for design and execution. At the same time, except in those quarters where the public buildings were situated, there could have been nothing striking or magnificent in the appearance of the city as a whole. The houses were of small height, and externally gloomy; the lower part being usually a blank wall plastered over, and often painted with different colours, and the upper pierced with small windows to light the apartments on the first floor. Internally there is very little costly decoration to be found, with the exception of mosaic pavements, which are numerous and extremely beautiful; and even in the public buildings marble is of rare occurrence. Its place, however, was not inadequately supplied by a stucco of great beauty, equally adapted to receive paintings or to be modelled into bas-reliefs; and these have been found in great abundance. The paintings are in general in a state of perfect preservation, and have all the freshness of recent finishing. In the Pompeian houses every species of masonry described by Vitruvius may, it is said, be met with, but the cheapest and least durable sorts have been generally preferred; and by far the greater part of the private, and many of the public edifices, are built of bricks, or of the rough masonry which is called *opus incertum*. Hence arises their rapid decay on being exposed to air. Copper, iron, lead, and other metals have been found employed for the same purposes as those for which we now use them; so that the articles discovered need not be enumerated. Almost all the doorways are nearly of the same size and form, a little more or less care in the execution of capitals and entablatures making all the difference between them. It is rare in Pompeii to see a whole house set apart for purposes of trade, a portion of it almost invariably furnishing an abode for the owner. The houses of the richer classes were usually surrounded by shops. Throughout the streets numerous signs are to be seen upon the shops, indicative of the trades which were pursued within. One of these represents two men carrying an amphora, and probably served as the sign of a wine-shop. And there is a painting of a boy mounted upon the back of another, and undergoing a process of flagellation; an ominous indication to all idlers that the schoolmaster was at home.

Fountains are very numerous both in the streets and houses of Pompeii, but it is not known from what source or sources the city was supplied with water. But, however obtained, the waters once brought to the city were distributed to its different quarters by conduits of masonry, lead, or baked earthen pipes. Fountains, which appear to have been *jets d'eau*, have been found in several houses; and there is a painting of one representing a broad vase with a jet of water rising from the centre. Of the manner in which the town was drained, and the numberless impurities carried off, little is known satisfactorily; but remains of a considerable sewer, with minor drainages converging to it, have been observed. The tombs line the approach to the city through the gate of Herculaneum. They are numerous, and almost all those which have been found are raised upon a platform of masonry above the level of the footway. They are themselves solid, elegant, and in many instances highly ornamented structures.

No perfect manuscripts, nothing but mere fragments, have been found at Pompeii. It may be mentioned that most of the houses have received their names from the paintings on the walls; but some have been designated from persons of rank being present at their excavation, and from other accidental circumstances. (See Mazois and Gau's *Les Ruines de Pompeii*, 4 vols., Paris, 1812-38; Sir William Gell's *Pompeiana*, 1st series, 2 vols., London, 1824; 2d series, 2 vols., London, 1830; *Pompeii*, 2 vols., 1831, by the Society of Useful Knowledge; *Pompeia*, Paris, 8vo, 1855; *Pompeji*, by Overbeck, Leipsic, 1856. Also Mommsen's *Inscriptiones Regni Neapolitani.*) (J. F. S.)

POMPEY, Cneius, commonly known as "Pompey the Great," was the son of Pompey Strabo, a Roman general, and was born on the 30th September 106 B.C. His first fame as a general was won in the great struggle against the Marian party. Hearing in 84 B.C. that Sylla, the leader of the opposite faction, was returning from the East, he resolved, with the most decisive activity, to advance the cause of that famous commander. Although only in his twenty-third year, he succeeded in raising a force of three legions in his family district of Picenum, marched southwards, routing or terrifying all the troops that came across his path, and at length had the honour of presenting to the chief of his party an entire army, well equipped, and flushed with several victories. His next act was to proceed to Sicily for the purpose of driving out Perperna, and recovering the island. No sooner had that been effected without any opposition, than he was found in Africa defeating Domitius, and reducing the savage country of Numidia. The title of *Magnus*, and the honour of a triumph, which were conferred upon him on his return to Rome in 81 B.C., only served to increase his military ardour. He did not rest until, in 76 B.C., he was sent into Spain to finish the war by subduing Sertorius, the only surviving general of the Marian party. At first, indeed, his youthful impetuosity was checked and repulsed by the veteran tactics of his able foe. Yet no sooner had Sertorius been assassinated by Perperna in 72 B.C., than he annihilated the hostile forces in one great battle, reduced the entire peninsula shortly afterwards, and returned to Italy in 71 B.C. to claim a second triumph. Pompey now entered upon the meridian splendour of his career. His personal qualities began to show themselves, and to give a fresh and exquisite interest to the remembrance of his great exploits. In private he was seen to be simple in his tastes, temperate in his habits, fond of domestic quiet, and faithful to his marriage vows. In public he appeared a thorough-trained soldier, a dignified general, a man of honour and integrity, gracious in granting a favour, and prompt in giving a telling reply. The people pampered and idolized him on every occasion. There was no commission which could be refused to him, and which he could not execute with honour and success. Appointed in 67 B.C. to the great task of exterminating the hordes of pirates who revelled in plunder and license along the entire length of the Mediterranean, he received the undivided empire of the sea and the coast, and commenced the enterprise with all the bold decision and comprehensive power of a mighty potentate. His numerous squadrons, distributed along the shores, chased the corsairs out of their favourite haunts in the numerous creeks and harbours. Then he himself, ranging the middle of the main with the body of his fleet, swept them all eastward before him, and bringing them to bay off the promontory of Coracesium, completely routed them, and remained undisputed king of the seas. Nor were his growing dominion and triumph checked even at this stage. As soon as it was known at Rome that he had extirpated the pirates, it was decreed that his command should also be extended over Asia Minor —that in fact almost the entire empire should be entrusted to his sway. Accordingly in 66 B.C. he began his progress through his new domains, invested with all the majesty and awe of a virtual emperor. Wherever he marched strife and opposition gave way before him. Mithridates, that formidable and inveterate foe to the Romans, fled at his approach to the distant regions of the Cimmerian Bosphorus. Kings and princes laid their crowns down at his footstool, and received them again from his hand. One country after another— Pontus, Armenia, Cappadocia, Paphlagonia, Media, Colchis, Iberia, Albania, Syria, Cilicia, Mesopotamia, Phœnicia, Palestine, and Judea, were compelled to submit to the Roman yoke. He was even meditating to extend his conquests as far south as the Persian Gulf, when in 62 B.C. the intelligence of the death of Mithridates led him to consider that the chief object of the war was accomplished, and to return with his spoils in triumph to Rome. This triumph, in 61 B.C., was the culminating point of Pompey's career, and from that date his influence began to decline. A much greater and abler man, Caius Julius Cæsar, was now silently and successfully plotting to supplant him in the supreme place of power. At first that wily rival artfully used him as a tool. He formed the league of the first triumvirate with him and Crassus, in order that he might obtain by their assistance the province of Gaul. He then gave him the hand of his daughter Julia, in order that he might bind him still more closely to his interests. At the same time, under the protection of these alliances, all his energies were bent to train a veteran army which might execute his plans by sheer physical force, to achieve a military renown which might inspire his foes with terror and his friends with confidence, and to amass a treasure of wealth which might buy him partisans in the distant city of Rome. At length, when all his projects were ripe for execution, he boldly demanded leave from the Senate to stand for the consulship without appearing personally at Rome, and on his being balked in his request, he crossed the Rubicon at the head of his army in 49 B.C., and marched towards the city. It was then that the sad decline of Pompey's power became apparent. He could procure no thoroughly-disciplined trustworthy levies, with whom he could oppose his formidable enemy. Those who flocked to his standard were raw recruits, helpless senators, and luxurious and foolhardy nobles. His army was bound together by no spirit of mutual confidence or unity of purpose. He felt himself compelled to leave Cæsar in undisputed possession of Italy, and to cross over in his fleet from Brundisium to Dyrrhacium. There, too, he failed to gain any real elements of strength. Although a year elapsed before he was confronted by the enemy, the spirit of insubordination and license was as prevalent in his camp as ever. Taunts and criminations continued to be cast against his generalship. He received no respite from blame, until he set aside his own plans of following closely upon the hostile troops and cutting off their supplies, and on the 9th of August 48 B.C. drew up his line of battle on the plain of Pharsalus. The consequence was, that his ranks were soon broken to pieces before the hardy battalions of the foe; his cause was totally ruined; and Cæsar remained the undisputed master of the world. Pompey was completely stunned by this sudden blow of fortune, and made no attempt whatever to retrieve his fate. Departing from the fatal field with a few attendants, and walking silently and sadly on, he reached the mouth of the river Peneus, and took refuge for the night in a fisherman's hovel. On the following day a Roman vessel took him on board, and repaired to Lesbos to take in his wife Cornelia and his boy Sextus. He then, without any definite purpose, coasted westwards along the shores of Asia Minor, receiving acquisitions of ships and attendants as he proceeded. On arriving at Cyprus, it was determined that he should seek an asylum with Ptolemy, King of Egypt, whose father he had been the means of restoring to the throne. His friends accompanied him to the coast of Pelusium, and with sad forebodings saw him entrust himself to an Egyptian boat which had come out to take him to land. Their fears were doomed to be realized. Just as he was on the point of stepping on shore, they saw the dastardly hirelings stab him from behind, and beheld him calmly muffle up his face in his toga, and fall with a dignity that was worthy of Pompey the Great.

Pompey, *Sextus*, surnamed "Magnus," after his father, was the younger son of Pompey the Great, and Mucia, and was born in 75 B.C. He first appeared on the field of action immediately after his elder brother Cneius had been defeated by Cæsar at Munda in 45 B.C. He then determined to take up the sword that had fallen from his brother's hand, and to devote his life to the avenging of his father's death, and to the recovery of his patrimony in Italy. Accordingly no time was lost in escaping to the border territory of the Lacetani, and in rallying around him in the mountain fastnesses a gang of banditti and desperadoes. In the course of a short period his band had swelled into an army, and his stealthy depredations had been exchanged for open and aggressive warfare. He marched southward, overwhelming all opposition, until he gained a firm footing in Bætica, and assumed the state and authority of a petty sovereign. Caius Carrinas and Asinius Pollio, the successive governors of the invaded province, tried in vain to crush him. Equally in vain was the attempt of the government at Rome to wheedle him into a surrender of his arms. Manning a fleet, he steered for the neighbourhood of Massilia, and lay off the coast, awaiting the issue of the political turmoil which had followed the death of Cæsar. When the result was announced in 43 B.C., and he perceived that a second triumvirate was formed, and that his own name was among the number of the proscribed, his future plan of action was determined. There was no resource for him but to resort to piracy, and become as daring a sea-king as he had formerly been a brigand chief. His mariners therefore commenced to board traffickers, and to make descents upon cities, with telling effect. Corsica, Sardinia, and Sicily fell into his power; Rome was reduced to the point of starvation by his interception of their corn-ships; and the triumvirs were at their wits' end how to deal with him. The negotiation which was held off the promontory of Misenum in 39 B.C. eventually proved fruitless. The attempts to subdue him by force were also signally foiled in the sea-fights at Cumæ and Messana. It was not until Octavian strained every effort to extirpate this pest of the sea that the aspect of the contest began to change. Then, indeed, the doom of Sextus Pompey was virtually sealed. A Roman squadron, under Agrippa, annihilated his fleet off Naulochus in 36 B.C. Forced to flee for safety, he repaired to the coast of Asia Minor only to involve himself in greater perils. A plot which he had formed for seizing the eastern provinces was detected; Titus, the legate of Antony, overtook him in his flight towards Armenia; and after being carried to Miletus, he was put to death in 35 B.C.

POMPEIUS, Trogus. See Trogus.

POMPONIUS MELA. See Mela.

POMPTINE or PONTINE MARSHES (*Pomptinæ Paludes*) was the name given to the extensive fens in the south of Latium, on account of their vicinity to the town of Suessa Pometia. They covered a space which was 7 or 8 miles in breadth, and which extended in a south-easterly direction to the length of about 30 miles. On the W. a desolate tract of sandy downs, diversified with clumps of trees and lagoons, separated them from the sea. On the other side they were hemmed in by the dry slopes of the Volscian Hills. Through the level district thus inclosed the Amasenus (*Amaseno*), the Ufens (*Uffente*), and other streams from the neighbouring high lands, took their course, creeping sluggishly along, spreading their ooze and slime over the entire dead flat, changing the ground into one large quaking bog, and sending up disease, pestilence, and death into the overhanging air. This immense stagnant pool continued for many centuries to swamp and swallow up all attempts to reclaim the soil from its dominion. In 312 B.C. the censor Appius Claudius Cæcus, while carrying his famous Via Appia directly through the middle of it, diverted the water into various channels; but in no long time the streams had risen above these, and filled them all up with mud. Many years afterwards, Augustus cleared and repaired the choked-up drains; but the silent sapping of the floods soon destroyed them once more. Equally vain were the successive efforts of several emperors and many popes to convert this scene of noisome desolation into a dry and habitable region. Highwaymen, footpads, and desperadoes were the only persons who ventured to dwell in it. The waters also continued steadily to increase, until the Appian Way, with its arches and bridges, was completely submerged. It was not until the pontificate of Pius VI. that the attempts at draining were in any degree successful. Canals were then dug which effectively carried off the floods, and which have been able, with occasional repairs, to keep the greater part of the plain dry down to the present day. Rich pastures and fertile corn-fields now extend over a large portion of that space which was once covered with soaking and barren mud.

PONANY, a seaport town of British India, in the district of Malabar, presidency of Madras, on the south side of a river of the same name, at its mouth in the Arabian Sea, 34 miles S. by E. of Calicut. It is a straggling place, built on level sandy ground; and it contains no fewer than 40 mosques, being inhabited chiefly by Mohammedans. Some of the houses are well built of stone, two storeys high, but the most of them are mere huts. The inhabitants live by fishing and trade. The latter is chiefly carrried on by the *patemars* or sea-going boats of the natives, in which they sail to Madras, Bombay, and even as far as Arabia or Bengal. The chief exports are pepper, rice, cocoa-nuts, iron, and timber; the imports, wheat, sugar-canes, molasses, spices, salt, &c. Pop. about 10,000.

PONCE, PEDRO, a Spanish Benedictine monk who lived in the middle of the sixteenth century, was celebrated as the inventor of the art of teaching the dumb to speak. His principal pupils were two brothers and a sister of the constable of Castile, and a son of the *gran justicia* of Aragon. They learned not only to write correctly, but even to express themselves by an articulate living voice. One of them, Don Pedro de Velasco, although he died at the age of twenty, had become a proficient in Greek, and a fluent writer and speaker of Latin. Another, assuming the garb of a Benedictine monk, was able to preach, and to go through all the other oral exercises of his calling.

POND, JOHN, an astronomer, was born about 1767, succeeded Maskelyne as astronomer-royal in 1811, and died in 1836. (For an account of his contributions to the advancement of science, see DISSERTATION SIXTH.)

PONDICHERRY (Fr. *Pondichérie*), a town of India, and the capital of the French possessions there, on the E. coast of the Carnatic, 85 miles S. by W. of Madras; N. Lat. 11.56., E. Long. 79.54. It is built at the S.E. extremity of a long flat hill, quite close to the beach, and to the mouth of a small river. From the sea it presents a grand and conspicuous appearance; nor is the visitor disappointed on a nearer approach, as it has straight and regular streets, a handsome square planted with trees, and fine boulevards. It is divided into the White and the Black Town by a canal, which is crossed by elegant bridges. The former part, which lies to the east, consists of lofty flat-roofed houses, with gardens in front. The Black Town is regularly laid out, but it consists for the most part of mere huts. The most notable buildings are the splendid government palace, the church of foreign missions, and the bazaars, which were erected in 1836. In the Black Town the most conspicuous edifice is an enormous and grotesque pagoda. Pondicherry has no harbour; and as there is a shallow bar, where the surge is very violent, peculiarly constructed boats with flat bottoms are necessary for landing. The river can only admit the very smallest craft. Abreast the town is a pretty good roadstead; and there is a lighthouse (finished in 1836) 89 feet high, and visible in clear weather 16 or 17 miles. Pondicherry has some cotton factories; and rice, indigo, and sugar are raised in the adjacent country. Fishing is also actively pursued, and there is an extensive trade.

The territory of Pondicherry, which has an area of 106 square miles, and is inclosed within the British district of South Arcot, consists of the three districts of Pondicherry, containing, besides the capital, eleven villages; Vallanor, containing forty-five villages; and Bahour, containing thirty-six villages. The executive and legislative establishment consists of a governor, a council of administration, and a council-general; the judicial establishment includes a royal court, a tribunal of the first instance, and a tribunal of peace and police. The governors of the other French possessions in India are subject to that of Pondicherry. The first French settlement here took place in 1674, they having purchased the town two years before from the Rajah of Bejapoor. In 1693 the place was taken by the Dutch; but restored, with its fortifications much improved, by the peace of Ryswick in 1697. Pondicherry was attacked by a British fleet and army in 1748, but without success, and the siege had to be raised. In 1758 Count Lally arrived here, and commenced vigorous measures against the British. Fort St David, Arcot, and the town of Madras fell successively before the French arms; but Fort St George, the citadel of Madras, held out till it was relieved, and Lally was obliged to retreat to Pondicherry. Subsequently the fortune of the war turned decisively against the French: Pondicherry was besieged, forced to surrender, and razed to the ground; while the other French posts in the Carnatic met with a similar fate. Along with their other possessions in the Carnatic, Pondicherry was restored to the French in 1763; and though subsequently more than once captured by the British, it was finally secured to France in 1814. Pop. of the town from 25,000 to 30,000; of the district (1856), 119,755.

PONIATOWSKI, PRINCE JOSEPH, the nephew of Stanislaus, the last king of Poland, was born at Warsaw in 1763, and was trained to the profession of arms in the Austrian service. His life from early manhood was consecrated to the cause of national liberty. In 1792 he led the Polish troops against the Russians; in 1794 he fought for freedom under the banners of Kosciusko; and on the defeat of his cause he went into exile, refusing to come to terms with the oppressors of his country. The arrival of Napoleon in Warsaw brought him once more into the field of patriotic action. Identifying the cause of his country with that of the great conqueror and deposer of kings, he devoted himself henceforth to the service of the French emperor. The command of the fifth corps of the "grand army" was entrusted to him in the fatal invasion of Russia; he gained fresh laurels on several fields during the campaign of 1813;

and he was discharging the important commission of protecting the retreat of the French army, when he was drowned in the river Elster in October of the same year.

PONS, a town of France, in the department of Charente-Inférieure, stands on the left bank of the Seugne, 14 miles S.S.E. of Saintes. It has the remains of an old castle, now used as a prison, with a square tower 108 feet high, an ecclesiastical school, and an orphan hospital. Dyeing, tanning, and the manufacture of woollen stuffs are carried on here; and there is some trade in wines and brandies. Pop. 4765.

PONS, *St*, a town of France, capital of an arrondissement in the department of Hérault, on the Jaur, an affluent of the Orb, 60 miles W. of Montpellier. It is well built, chiefly of variegated marble, quarried in the vicinity. The church, of this material, is historically of some interest. St Pons has also an ecclesiastical school, a communal college, a tribunal of the first instance, manufactories of woollen cloth, dye-works, tanneries, saw and flour mills, &c. There is some trade in corn and cattle. Iron mines, as well as marble quarries, are worked in the vicinity. Pop. (1856) 6512.

PONT-À-MOUSSON, a town of France, in the department of Meurthe, on the Moselle, here crossed by a bridge, from which the town takes its name, 16 miles N. of Nancy. On a hill to the east stand the ruins of the old castle of Mousson. The ramparts with which the town was surrounded are now public walks planted with trees. The principal square, which is lined with arcades, contains an old house, called the "House of the Seven Deadly Sins," from the curious sculptures on its front. The chief public edifices are the Gothic church of the thirteenth century, the town-hall, cavalry barracks, and the seminary occupying the buildings of the ancient abbey of St Mary. Pont-à-Mousson has also an hospital, tanneries, breweries, potteries, sugar-houses, and some trade in corn, wine, brandy, &c. Pop. 7843.

PONT-AUDEMER, a town of France, capital of an arrondissement in the department of Eure, on the left bank of the Rille, which here becomes navigable, 38 miles N.W. of Evrua. It is a prettily-situated, clean, and well-built town, surrounded with walls and ditches. Here tanning is the staple employment of the people; there are no fewer than forty tanyards, besides curriers and establishments for dressing leather. Even one of the churches, that of Notre Dame des Prés, has been converted into a tan-house. This building, and the churches of St Germain in the suburbs, and of St Ouen and St Sepulchre, are architecturally interesting. Pont-Audemer has also public baths and a small theatre. There is some trade in hides, leather, corn, cider, flax, and other articles. Pop. (1856) 5832.

PONTARLIER, a frontier town of France, in the department of Doubs, stands on the river Doubs, at the foot of one of the chains of the Jura, and at the entrance of a mountain pass leading into Switzerland, 35 miles S.E. of Besançon. It has much of the appearance of a Swiss town, with its neatly-built houses arranged in broad straight streets. Its town-hall, college, market-house, and cavalry barracks, are its chief buildings. There are here large iron foundries and furnaces, a copper foundry, a brewery, saw-mills, and tan-yards; besides manufactories of scythes and other implements. Some trade is carried on in horses, cattle, marble, timber, clock-work, essence of wormwood, paper, &c. Pop. (1856) 4783.

PONT ST ESPRIT, a town of France, in the department of Gard, on the right bank of the Rhone, 32 miles N.E. of Nismes. It derives its present name (for it was formerly called *St Saturnin*) from the great bridge which crosses the broad and rapid river, and which is the longest stone bridge in the world, being 2717 feet, or three times as long as London Bridge. It crosses the river obliquely, and has 23 arches, varying in size, the largest being 108 feet wide. It was finished in 1309, after 45 years of labour; and the cost was partly defrayed by offerings made at a small chapel of the Holy Ghost at one of its ends. The town is ill built, with narrow irregular streets; it is defended by ramparts, and by a citadel built by Louis XIII. against the Protestants. There is here a good harbour, and some trade in wine, oil, fruits, provisions, &c. Pop. 5538.

PONTECORVO, a town of the Papal States, in an isolated district of the same name belonging to the province of Frosinone, but surrounded by the Neapolitan province of Terra di Lavoro, on the left bank of the Garigliano, 20 miles S.E. of Frosinone. It is the seat of a bishop, and has a mediæval castle, a cathedral, a fine bridge, and an hospital. In the vicinity there are some remains of the ancient Interamna. Pop. 5300.

PONTEFRACT, or POMFRET, a parliamentary and municipal borough and market-town of England, in the West Riding of Yorkshire, on an eminence near the Aire, 24 miles S.S.W. of York, and 177 N.N.W. of London. The original appellation of the town was *Kirkby* under the Saxons; but it obtained its present name (from the Latin *pons fractus*) on account of the breaking of a bridge over the Aire. A castle, the remains of which still exist, was built here in 1080 by Ilbert de Lacy, who received from William the Conqueror a grant of the adjacent lands. In the beginning of the fourteenth century it passed by marriage to Thomas, Earl of Lancaster, uncle to Edward II., who was executed here by his nephew in 1322. Several important historical events took place in the castle of Pontefract; as the murder of Richard II. in 1399, the execution of Archbishop Scrope for rebellion against Henry IV. in 1405, and the murder of Lord Rivers and others by order of Richard III. in 1483. During the civil war the castle was garrisoned for Charles I. by Colonel Lowther; besieged in vain by Lambert in 1644; surrendered to Fairfax in 1645; retaken in 1648 by Colonel Morrice, who first issued money in the name of Charles II. here; and finally captured and destroyed by Lambert in 1649. It seems to have consisted of several towers; the remains are very few, and the site is now occupied by gardens. The town is well built, chiefly of brick, and has several broad well-paved and well-cleaned streets. The parish church is old, but has been very much altered. The old church of All Saints, formerly the parish church, is cruciform, and has a fine tower. It has recently been restored and fitted up for public worship. Besides these, there are places of worship in Pontefract for Roman Catholics, Independents, Quakers, Wesleyan and Primitive Methodists. Of several ecclesiastical establishments, colleges, and hospitals, that formerly existed here, no traces now remain. There is here a town-hall and a commodious court-house, in which the Easter quarter sessions are held. There is a free grammar school with an interest in several exhibitions to Oxford, a charity school, national and British schools, a subscription library, mechanics' library, news-room, and savings-bank. The charitable institutions include a dispensary, poor-house, and several almshouses. The surrounding country is celebrated for its gardens and nurseries, from which vegetables are supplied to York, Leeds, Doncaster, and other places. Liquorice is extensively raised on the deep rich soil of this district. There are also coal-mines and flour-mills in the neighbourhood, and filtering stones are quarried on the castle-hill. Though not remarkable for its manufactures, Pontefract produces hats, iron and brass castings, earthenware, bricks, tiles, beer, &c. There is some trade in liquorice, malt, corn, &c.; and eight annual cattle-markets are held at Pontefract. The borough is governed by a mayor, three other aldermen, and twelve councillors; and it returns two members to the House of Commons. Pop. (1851) of the municipal borough, 5106; of the parliamentary, 11,515.

PONTE LAGOSCURO, a town of the Papal States, in the province of Ferrara, on the Po, 4 miles N. of Ferrara. It has a free harbour, and an active transit trade. Pop. 6000.

PONTEVEDRA. See Galicia.

PONTEVICO, a town of Austrian Italy, in the province of Brescia, on the Oglio, 20 miles S.S.W. of Brescia. It is an old walled town, and has a ruined castle, formerly very strong. Many of the houses are well built. There is much manufacturing industry; and an active trade is carried on in corn and wine. Pop. 5870.

PONTIANAK, a town in the Island of Borneo, at the mouth of a river of the same name on the W. coast, 391 miles E.S.E. of Singapore, almost under the equator, in E. Long. 109. 20. It is the seat of the governor of the Dutch possessions of the W. coast of Borneo, and of a tributary sultan. Though built on marshy ground the climate is healthy; and the town is chiefly remarkable for its commerce. There are many Chinese here, who export diamonds, gold-dust, birds' nests, and other articles. Pop. of the town, 3000; of the district, 19,115, chiefly Malays. Pontianak was settled in 1823.

PONTIFEX, Pontiff, or *High Priest* (probably from *pons*, a bridge, and *facere*, to sacrifice), a person among the Romans who had the direction and superintendence of divine worship. The Roman pontiffs, which formed the most illustrious among the great colleges of priests were supposed to be founded by Numa. A pontifex might hold any other office, whether military, civil, or priestly, provided they did not interfere with one another. The college of pontiffs, which was always ruled over by the emperors, continued to exist until the overthrow of paganism, when the title was assumed by the Christian bishop of Rome, and subsequently by the Pope.

PONTIVY, a town of France, capital of an arrondissement in the department of Morbihan, on the left bank of the Blavet, 30 miles N. by W. of Vannes. It is ancient, and has still some remains of the old walls and gates. A new quarter was added by Napoleon I., who gave the town the name of *Napoleonville.* On the restoration of the Bourbons the old name was resumed; but recently it has again been called Napoleonville, and is given under that name in the census of 1856. The chief building in the town is the picturesque but ruinous old castle of the dukes of Rohan. The new portion lies outside the walls, and has broad regular streets; but being unfinished, it has a desolate appearance. Pontivy has a prison and very handsome cavalry barracks. It contains numerous tanneries, and has an active trade in corn, linen, thread, horses, cattle, hides, leather, &c. Pop. (1856) 6859.

PONTOISE, a town of France, capital of an arrondissement in the department of Seine-et-Oise, on the side of a steep hill on the right bank of the Oise, 18 miles N.W. of Paris. The river is here crossed by a bridge, whence the town derives its name (*Pont Oise*, Oise bridge). Remains of the castle and walls that formerly defended the town still exist. The streets are in general steep and narrow. There is an interesting church in various styles of architecture; a Gothic court-house, a public library, and a splendid hospital. Pontoise has also a college and several schools. Clocks and watches, chemical substances, cotton yarn, leather, &c., are manufactured here; and there are many corn-mills turned by the Oise and its affluent the Vionne. Pop. (1856) 5366.

PONTOON, a kind of flat-bottomed boat, the body of which is composed of wood lined without and within with tin. Pontoons serve for the construction of bridges over rivers to facilitate military operations. Our pontoons are 21 feet in length, 5 feet in breadth, and in depth within 2 feet 1·5 inches.

PONTOPPIDAN, Eric, a learned Dutch writer, was born at Aarhuus in Jutland in 1698, and studied divinity at the university of Copenhagen. His passion for the study of geography and history was encouraged by a considerable amount of patronage. On finishing his education he was appointed travelling tutor to several young noblemen; in 1735 the office of one of the king's chaplains was conferred upon him; in 1738 he was promoted to a theological chair at Copenhagen; and in 1747 the bishopric of Bergen in Norway was entrusted to his charge. Accordingly, at his death in 1764, he left behind him various works on the typography and annals of his native country. Among these were *Theatrum Daniæ Veteris et Modernæ*, 4to, 1830; and *Gesta et Vestigia Danorum extra Daniam*, in 2 vols. 8vo, 1740. He was also the author of a work on the natural history of Norway, which was translated into English in 1755.

PONTREMOLI, a town of the duchy of Parma, stands at the confluence of the Magra and Verde, on the southern slope of the Apennines, 36 miles S.W. of Parma. It consists of an upper and lower town: the upper is ancient, defended by a castle and massive picturesque fortifications; the lower town has a more modern aspect, and contains a cathedral and many good houses. There is here an episcopal seminary, a literary society, and several schools. The weaving of silk and linen stuffs is the principal branch of industry. Pontremoli was formerly an important place, commanding one of the chief passes of the Apennines between Tuscany and Lombardy. It belonged at one time to the Genoese, at another to Milan, and previously to 1847, when it was ceded to Parma, it formed a part of Tuscany. Pop. 10,600.

PONTUS, an ancient kingdom in the N.E. of Asia Minor, which derived its name from its being on the Pontus Euxinus, extending from the River Colchis in the east to the River Halys in the west. In early times its various parts were designated after the tribes which inhabited them. The most important of those tribes are,—the Leucosyri, Tibareni, Chalybes, Mosynœci, Heptacometæ, Drilæ, Bechires, Byzeres, Colchi, Macrones, Mares, Taochi, and Phasiani. From the middle of the seventh century B.C., many of those tribes inhabiting the coast rose to great power and opulence, spreading Greek culture and civilization around them; while many of those of the interior were extremely savage and wild. According to tradition it was conquered by Ninus, founder of the Assyrian empire; and it was certainly under the Persian dominion after the time of Cyrus the Great. In the reign of Artaxerxes II., Ariobarzanes conquered several of the Pontian tribes, and laid the foundation of an independent kingdom. Mithridates II. succeeded him B.C. 337, who, by availing himself of the disputes of the successors of Alexander, considerably enlarged his dominions. He was followed by Mithridates III., by Ariobarzanes III., by Mithridates IV., by Pharnaces I., and by Mithridates V. Under Mithridates VI., from B.C. 120 to B.C. 63 (see Mithridates), the kingdom of Pontus rose to its highest dignity. In his war with the Romans his kingdom was dismembered by Pompey, B.C. 65, who annexed the western part of the nation, and gave the remainder to the native chiefs. A portion between the Iris and the Halys was given to the Galatian Deiotarus, which was henceforth called Pontus Galaticus. The Colchians and other tribes received a king in the person of Aristarchus. Pharnaces II., son of Mithridates, received the Crimea and some neighbouring districts, under the name of Bosphorus; and the central part of the Pontian kingdom, subsequently given to Polemon, was henceforth termed Pontus-Polemoniacus. The widow of Polemon, on her marriage with Archelaus, King of Cappadocia, transferred to him the eastern part of the kingdom, subsequently called Pontus Cappadocius. On occasion of Polemon II., son and successor to Polemon I., resigning his kingdom into the hands of Nero, Pontus was made a

Roman province A.D. 63. In the changes which transpired under Constantine, the province was divided into two parts,—viz., Helenopontus after the emperor's mother Helena, and Pontus Polemaicus.

Pontus embraced the modern pashaliks of Trebizond and Siwas. The country was surrounded by mountains, and the plains were highly fertile. It grew excellent fruit,—cherries, apples, pears, various sorts of grain, timber, olives, and aconite. Game was found in abundance; and the bees were much valued. The mineral wealth of the country consisted chiefly of iron and salt. The chief mountains of Pontus are the Pharyadres, and on the east Scœdises, two ranges of Antitaurus, sending off various branches. Proceeding from W. to E. we have the promontories Heracleium, Jasonium, and Zephyrium, which form the bays of Amisus and Cotyora. The mountains of the south give rise to the Halys, Lycastus, Chadisius, Iris, Scylax, Lycus, Thermodon, Beris, Thoaris, Œnius, Phigamus, Sidenus, Genethes, Melanthius, Pharmathenus, Hyssus, Ophis, Ascurus, Adienus, Zagatis, Prytanis, Pyxites, Archabis, Apsarus, Acampis, Bathys, Acinasis, Isis, Mogrus, and the Phasis. To the west, north of the river Scylax, is the lake called by the ancients the *Stiphane Palus*.

PONTYPOOL (said to be a corruption of *Pont-ap-Hywel*, Howell's Bridge), a market-town of England, in the county of Monmouth, stands in the midst of mountains, on a steep hill on the right bank of the Afon Llwyd, an affluent of the Usk, 19 miles S.W. of Monmouth, and 149 W. by N. of London. It is straggling and irregularly built, but contains many good houses and shops. The parish church, which stands on a hill about a mile from the town, is a fine building in the early English style, with a square embattled tower. The Wesleyans, Independents, Roman Catholics, and other sects, have also places of worship here. There are, besides, national and infant schools, a reading-room, and a savings-bank. The prosperity of the town is derived chiefly from the manufacture of iron and tin wares which is carried on here, and from the coal-pits and iron mines that are worked in the vicinity. From the rapid extension of these sources of employment, the population of the town and parish has also rapidly increased. Weekly markets and annual fairs are held at Pontypool; and there is some trade in iron and coal. Pop. (1851) 3708.

PONZ, Antonio, an industrious and useful writer on art, was born at Bexix, near Segorbe in Valencia, in 1725. He was educated for the church; but a strong bias turned his mind from his professional studies to the fine arts and kindred subjects. While finishing his theological course at Valencia, he took lessons in painting from Richarte. After he had gained the degree of Doctor of Divinity, he placed himself as a pupil at the provisional academy at Madrid, and studied there from 1746 to 1751. His predilection for the antique then led him to Italy; and the next nine years were spent in imitating the great masters at Rome. On his return to his native country he was still continuing to improve himself in art, and was copying Raphael, Paul Veronese, and Guido, in the Escorial, when a new sphere of labour was opened up to him. Commissioned by government to visit the colleges of the ejected Jesuits, and to collect whatever valuable works of art might be found there, Ponz began to write an account of his observations and travels. It soon appeared that he was even better fitted for this task than for painting. His style, it is true, was sluggish, dull, and prolix. His mind also observed no method, loitered over every object that chanced to fall in its way, and was allured by every accidental circumstance into the most irrelevant digressions. Yet he was an inquisitive, indefatigable, and candid investigator. Especially were his zeal and his fidelity commendable in describing works of art, and in rescuing the names of many artists from oblivion. The book accordingly met with a very favourable reception. The first seventeen volumes, which appeared during the author's lifetime, were the means of securing for him much patronage and honour till his death in 1792. The entire work, published after his death in a complete form, under the title of *Viage de España*, 18 vols., 1772–94, took the first place as a guide-book to Spain. It is only within recent years that it has been superseded by the English hand-book of the late Richard Ford.

PONZA (anciently *Pontia*), the largest and only inhabited island of a small group in the Mediterranean, lying off the coast of Naples, included in the province of Terra di Lavoro, and 29 miles S.W. of Terracina. It is crescent-shaped, 5 miles long and 1 or 2 broad, and has a natural harbour on the concave side, which looks towards the mainland. Near the harbour stand a castle, governor's house, storehouses, and a few houses and huts. The surface is entirely rocky, and generally barren; but there are some good pastures for cattle. The inhabitants are chiefly employed in fishery and salt-works. Pop. 1500. The other islands of the group are Palmarola and Zannone. Ponza and Palmarola were used as places of banishment by the Romans.

POOLE, a municipal and parliamentary borough, seaport, and market-town of England, forming a county by itself, in Dorsetshire, on a peninsula on the N. side of Poole harbour, 20 miles E. of Dorchester, and 97 W.S.W. of London. It is an old town, built for the most part of red brick, and somewhat resembling Sheerness and Portsmouth. The streets are irregular, and many parts of the town have a mean appearance; but the more modern portions are well and substantially built. The parish church of St James (rebuilt in 1812), the custom-house, town-hall, guild-hall, jail, and an old edifice called the King's Hall or wool-house, are the principal public buildings in the town. The Independents, Baptists, Wesleyan and Primitive Methodists, Unitarians, Roman Catholics, and Quakers, have places of worship in Poole; and there are also National and British schools, a free grammar school, a public library, a savings-bank, and several well-endowed almshouses. The peninsula on which Poole stands is lined towards the sea with broad and convenient quays and warehouses. Shipbuilding is extensively carried on especially the construction of sailing-yachts; sail-cloth, ropes, and other articles used in ships are also made here. The number of sailing-vessels registered at Poole, December 31, 1857, was 113, tonnage 15,445; of steam-vessels 1, tonnage 22. In the year 1857 there entered the port 751 sailing-vessels, tonnage 61,514; and there cleared 517 sailing-vessels, tonnage 31,183, and 1 steamer, tonnage 18. Poole harbour is an extensive estuary, communicating with the sea by a very narrow entrance. It is 6 miles in length, and 4 or 5 in breadth, and has a very irregular outline. The water is shallow throughout, and there are many mud-banks laid bare at low water. A fine view is obtained from the town and its vicinity of the harbour, the beautiful island of Brownsea, the extensive heaths which spread around, the bold chalk range on the south, in a deep cleft of which stand the ruins of Corfe Castle. North of the town is a smaller arm of the sea, called Holes Bay, connected with the harbour by a narrow channel, which is crossed by a swing bridge. It is remarkable that the tides in Poole harbour ebb and flow twice in twelve hours. This is caused by the position of the entrance facing the E., and by the ebb tide from the Isle of Wight forcing the water up into the bay. On a bank near the harbour's mouth many oysters are obtained, and taken to the shores of Kent and Essex to be fattened. The fishing of plaice and herring is also carried on at Poole; and there is a considerable trade in the export of corn and clay. It is supposed that there was a harbour at Poole as early as the time of the

Romans, as there are traces of a Roman road between it and Winchester. The town received its first charter in the time of Richard I., but it was Elizabeth who raised it from being a mere fishing village to the rank of a town and county. In the civil war, Poole, then a fortified place, was held by the republican party; and in the reign of Charles II. its fortifications were destroyed. The borough is governed by a mayor, five other aldermen, and eighteen councillors; and it returns two members to Parliament. Pop. (1851) 9255.

POOLE, MATTHEW, the learned author of the well-known *Synopsis Criticorum Biblicorum*, was born at York in 1624, where he inherited a good family estate. He was educated at Emmanuel College, Cambridge, and was afterwards transferred in 1648 to succeed Anthony Tuckeney in St Michael le Querne, London. He held this rectory for some time, but was compelled to leave it, being unable to comply with the terms of ministerial conformity imposed by the Act of Uniformity just passed. Before this time he had been actively and successfully engaged in a project for the education of those intending for the ministry, of which, in 1658, he printed an account, entitled *A Model for the Maintaining of Students of Choice Abilities in the University, and principally in order to the Ministry.* In 1662, being ejected from his living for Nonconformity, he had leisure to complete the great work by which his name has become so extensively known. The design was to bring into one view all that had been written to illustrate the Scriptures throughout all ages. This he completed in ten years; and the *Synopsis Criticorum Biblicorum* appeared in 5 vols. in 1669–76. He was likewise engaged in most of the controversies of his time. He attacked Biddle on Socinianism, published a defence of the Nonconforming clergy in 1662, wrote against the intrusion of laymen into the ministerial office, and numerous pieces in opposition to Popery. His last work was *Annotations on the Holy Bible*, which he had carried as far as the 58th chapter of Isaiah. It was subsequently completed by several of his Nonconforming brethren, and appeared in 2 vols. folio, 1685. This very able critic retired to Holland in quest of toleration, and died at Amsterdam in 1679.

POONA, a town of British India, capital of a collectorate of the same name in the presidency of Bombay, stands at the confluence of the rivers Moota and the Moola, which form the Moota Moola, in a treeless plain bounded on the W. by the Ghauts, 74 miles S.E. of Bombay, and 58 N. of Sattara. Until recently it was an ill-built place, having more of the appearance of a village than of a town; but since 1841 it has been much improved: two good stone bridges, instead of the ruinous old Mahratta one, have been thrown across the Moota Moola; many good and some splendid houses have been built; and the streets adjacent to the cantonments on the east have been macadamized. The chief building in the town is the former palace of the Peishwa, now used as a prison, hospital, and lunatic asylum. It is extensive, and consists of a fine quadrangle lined with ranges of carved wooden pillars. The British cantonments, which occupy an elevated position to the west of the town, are among the best and largest in India. Here there are broad streets, and a large but not very elegant church. The chief street in the town is broad, and presents a cheerful appearance, as many of the houses are adorned with painted and carved representations of mythological subjects. Poona contains numerous pagodas and extensive bazaars. The town has long suffered from the want of an adequate supply of water, and various efforts have been made to procure it. It was resolved to obtain a sufficient supply from the Moota Moola by means of a dam; and this was completed, after several failures, in 1850, chiefly at the expense of Sir Jansetjee Jejeebhoy. But after all, these works were found to be unsuitable to the end in view; they had to be abandoned, and other measures resorted to for supplying the town with water. There was at Poona a government English school, which has recently been united with the Sanscrit College, established in 1821. This institution had in 1853, 497 pupils. The town has also three girls' schools, all established since 1851, and attended in 1853 by 237 pupils in all. The manufactures of Poona have fallen off very much since the introduction of European goods; and there is only now a manufacture of paper to a very small extent. There is a profitable trade carried on in grain and the raw produce of the country; but with this exception, the merchants of Poona are said to be declining in wealth; and the trade in jewellery and precious stones which, under its Indian rulers, was carried on here, has entirely disappeared. In the neighbourhood of the town there are many ruinous hill-forts and an excavated temple, similar, but greatly inferior, to those of Elephanta and Ellora. Poona stands on the south-eastern branch of the Great Indian Peninsular Railway, and is connected by roads with Bombay, Sholapore, Ahmednuggur, Nassick, and Sattara. Communication by water can be carried on during the rainy season by means of the Moota Moola, Bheema, and Krishna rivers, from within 75 miles of the west coast of India to the Bay of Bengal.

Poona was, in the flourishing period of the Mahratta power, a great place of rendezvous for the different independent chiefs, with their numerous followers, in order to consult on the general interests of the confederacy, and, when at war, to settle the plan of operations. These meetings were held about the middle of October, at the end of the rainy season, and were sometimes attended by 400,000 or 500,000 people, who were encamped in the surrounding plain, and were well supplied with every necessary, such as wood, grain, and fodder, which were brought down the rivers. At the height of the Mahratta power Poona is said to have contained 150,000 inhabitants; and at its fall in 1818, 11,000. The population in 1838 was estimated at 75,170.

The collectorate of Poona, which has an area of 5298 square miles, is bounded on the N. by the collectorate of Ahmednuggur, E. by those of Ahmednuggur and Sholapore, S. by the territory of Sattara, and W. by the collectorate of Tannah. It belongs entirely to the Deccan; and is bounded on the W. by the Western Ghauts, from which many branches proceed, generally in a S.E. direction, sloping gradually down to the plain. The chief rivers are the Bheema and its affluents, the largest of which is the Neera. The soil and climate of the country are extremely arid, and the east winds especially very dry; but the climate in general is not unhealthy, nor unsuitable for Europeans. The country is almost entirely destitute of trees, but it produces the ordinary grains of the Deccan, potatoes, &c.; and cotton also is cultivated to a small extent. Pop. (1855) 666,006.

The first notice of Poona occurs in the early part of the seventeenth century, when it was included in the jaghire or estate of Shahjee, father of the famous Sevajee, the founder of the Mahratta power, who built the palace there for his own residence. In 1740 the office and the power of the peishwa or minister was rendered really supreme, and that of the rajah merely nominal, by Balajee, who fixed his residence at Poona, and died there in 1761. The dignity was transmitted to his son Madhoo Rao, who died in 1772, and was succeeded by his brother Narrain Rao, who was murdered by his uncle Ragoba; and shortly afterwards a posthumous child of the deceased was placed on the throne. He died in 1795; and the elder of the two sons of Ragoba, named Bajee Rao, succeeded. This peishwa was supported by Scindia, and took his part against Holkar, who totally defeated both the allies at Poona in 1802. In order to avoid total ruin, Bajee Rao applied for an alliance with the British. A treaty was in consequence concluded which re-established his authority; and this good understanding continued for nearly fifteen years. But in 1817 the peishwa, anxious to emancipate himself from the British yoke, entered into the hostile combination which was then formed amongst the native powers for the assertion of their independence. As the contest ended in the triumph of the British armies, the peishwa was compelled to fly; and in May 1818 he at last consented to resign his office, and to retire on a pension to Benares. A portion of his country was given to the rajah of Sattara, the representative of the line of Sevajee, which had been supplanted by the peishwas; but that line afterwards becoming extinct, the whole territory fell to the British.

POORBUNDER, a town of India, on the S.W. coast of the peninsula of Kattywar, in the province of Guzerat, presidency of Bombay, 210 miles S.W. of Ahmedabad, and 275 N.W. of Bombay. It has a harbour, which, being obstructed by a bar at the entrance, does not admit vessels of a large size. The harbour is, however, the best on this coast, and frequented by many vessels, which carry on an active trade with the various seaports in Sinde, Beloochistan, Arabia, the east coast of Africa, and the Concan and Malabar coasts. The principal articles of export are wheat, oil, millet, cotton, and thread; the imports, iron, steel, tin, lead, sugar, pepper, spices, and other articles. There are about sixty vessels of various sizes belonging to the port. The half of the duties levied at the port of Poorbunder, amounting annually to L.3000 or L.3500, is paid to the British government by the rana, or chief of the Jaitwa tribe of Rajpoots, who holds the town and surrounding districts from the Guicowar, himself a dependent ally of the British.

POOR-LAWS.

Until very recently, the great interest felt in the body of laws comprehended under the above title was derived from the consciousness of the danger with which the manner of their administration in England threatened the property of the rich, and the morality of the whole people. As the law continues fundamentally the same as it was before the adoption of an improved administration, that source of interest in these institutions remains; but the present sense of security renders possible a calmer and more dispassionate examination of their merits and demerits than could previously to the year 1834 have been made by the most candid persons acquainted with the rapid progress of the evils of the system.

Origin and objects of poor-laws.

It was generally, and is now frequently, assumed by English writers, that a legal system of compulsory relief to the poor was peculiar to the polity of England. No assumption could be less justified by the facts, as will presently be shown. Wherever inquiry has been made, it has been found that the same objects as were sought by the institution in England have been sought by means which more strictly resemble those adopted in England, in proportion as the condition of the community resembles that of England in the complexity of its social relations and the progress of its legal polity.

So general an adoption of analogous institutions amongst independent communities was, of course, not fortuitous, nor the mere result of imitation; and these institutions are everywhere of too distinct and recent an origin to be traceable to any of the primitive laws or customs of those several peoples who have descended from one common race.

On the contrary, it was the development of the like evils in the progress of the civilization of each country which suggested the adoption of the like remedy. The evils which were sufficient to induce nations to try a remedy so obviously fraught with great dangers both to the givers and to the receivers, and requiring sacrifices so immediate and so incapable of disguise, appear to have been at least as pressing elsewhere as in England. The description of these evils shows that they were and must be of universal prevalence, and that they have their origin in the constitution of mankind, and not in any such incidents as the dissolution of monasteries or in any other local or temporary incident.

There never was a time or place in which there were not to be found men anxious to avoid labour, and yet to live in ease and enjoyment. There never was a time in which other men were not, from their sympathy, from their superstition, and from their fears, ready with their bounty to assist the necessitous, and liable to be imposed upon and intimidated, according as the beggar was crafty or bold. No community is so poor as not to suffer in some degree from the existence of a body of idle and worthless persons, subsisting profligately on the benevolence, the folly, or the fears of its members.

And as the condition of the people is found to improve, as progress is made in the arts and commodities of life, there is, of course, found a greater disparity in the condition of the people, and destitution more violently contrasted with opulence. Such a state of things, whilst it increases the means at the disposal of the benevolent and fortunate, increases the sympathy with the unfortunate, or those who appear to be so, and at the same time presents wealth in such masses as to serve as a temptation to those who may prefer to live by fraud or violence. Mendicancy and depredation, which are nearly impossible where a population is scattered, and its moveable wealth in small quantity, become easy in the contrary state of things.

It is accordingly found, in the progress of the civilization of every country, that a period arrives when beggary in its many forms, and with its whole train of consequences, appears in an alarming extent, usually even professed by large fraternities having some character of organization; sometimes connected by religious profession, like palmers, pilgrims, and various orders of mendicant friars, faquirs dervishes; sometimes connected by supposed identity of race, as the people known throughout the continent of Europe, and largely in Asia, as Zingari, Gypseys, Bohemians: these, with the unfortunate and dissolute of all classes, find a means of living by practising various arts of amusement, and more frequently by operating on the superstitious credulity, and often on the fears, of the more wealthy and industrious part of the community. All accounts of such a state of things, wherever it may have prevailed, agree in showing that predatory habits almost invariably accompany, where occasion offers, the habit of mendicancy.

Great as were the evils obviously connected with the existence of such a mass of idlers, impostors, and depredators, there were not wanting motives to the other classes to perpetuate and increase the evil. Individual benevolence, even where accompanied by intelligence and prudence, although its objects may be immediately selected from the really unfortunate, would not withhold its indirect aid to this bad effect, its respectable example seducing many to imitate the act, without using the due precautions.

But a much greater share of the effect must always be attributed to the incautious benevolence of the great mass of those who have the power to give. It requires great knowledge and sagacity to distinguish the cases in which alms can be given without directly encouraging idleness, or some worse vice; and to direct these qualities effectively to the case of each applicant would, in the state of things described, require an amount of industry and an expenditure

Objections to Public Relief, &c.

of time seldom or never possible. The ignorance and indolence, therefore, of the benevolent, afford the largest encouragements to the idle. Other influences are not wanting, especially ostentation and the love of popularity, which, where many live in idleness, never fail to create dependents and retainers to the full extent of the power or the will to maintain them. Superstition, too, has in all times enforced alms-giving as a virtue, and, operating upon the consciences of great criminals, has throughout the world created and endowed the largest and most magnificent of the so-called charities.

In the above description will be recognised a state of things partially exemplified, either in one set of its details or in another, in every country in Europe, more especially in those in which, like Spain, Naples, many other Italian states, and other countries, no public or well-controlled and systematic provision for the poor has been established.[1]

These observations will be well instanced in England during the progress of the institutions of which a description is about to be given.

CHAPTER I.

GENERAL OBJECTIONS TO PUBLIC RELIEF AND TO PRIVATE ALMS-GIVING.

The fact was adverted to in the beginning of this article, that the state of the poor-laws since 1834 enables us to take a more dispassionate view of the abstract merits and defects of a system of public relief than was formerly possible, while the question was embarrassed by the consciousness of the evils which we were suffering, and of those towards which we were visibly making a rapid progress. On the other hand, the evils of general mendicancy, and the other painful and dangerous circumstances which are everywhere found to prevail where a public law of relief has not been established, are so little known in England, from whence our poor-laws have long excluded them, that little of the good really derived from our poor-laws was acknowledged, whilst the whole of their positive mischief was so apparent as to form almost alone the matter of every discussion of the merits of the system.

Alms-giving.

Before great accumulations of moveable wealth have taken place in any community, depredation to any large extent is scarcely possible, and mendicancy as a trade cannot be followed in such a community, especially where its population is widely scattered. Alms-giving, in the usual sense of the term, does not exist; but its place is often supplied by hospitality to the stranger and traveller, and by the readiness to share with friends or relatives the means of enjoyment which individuals may possess. But in countries where comparatively great accumulations of wealth have taken place, and where poor-laws have not been introduced, or where, as in Ireland before 1838, they have not taken root, alms-giving and begging are either avowedly permitted or connived at. And, for reasons hereafter to be shown, the alternative of a regulated system of *public relief*, or the practical permission, whether avowed or not, to solicit *private alms*, appears inevitable.

Objections to Public Relief, &c.

Poor-laws.

It would be an evasion of the question to compare a well-devised system of poor-laws with a system in which alms-giving was to be substituted. It is necessary, in order to do full justice to the comparison, to assume a system of poor-laws fraught with all the evils known to be derivable from such a system, and administered with a degree of laxity not less than that of which we have had a practical experience. A system of public relief may be had in principle, and yet judiciously administered; or it may be good in its principle and ill administered. For the present purpose, a system shall be assumed, bad in its principle and bad in its administration.

Operation of a bad poor-law.

In this view, the law may give a claim to all persons not having means of independent subsistence, to be relieved, without subjecting the claimant to any harsh or disagreeable condition. Such a claim, though never in fact countenanced by the law, was practically allowed for above a quarter of a century in many parts of England. A law of this kind would obviously render all those who by their exertions could at the utmost earn but a bare subsistence, averse to industry, which in such a case would be a sacrifice of ease without any increased advantage. If present industry were rendered useless, so would thrift and forethought become a folly, an abandonment of present enjoyment without an object. Every present indulgence which the law allowed would wisely be enjoyed; good moral habits and bodily skill would have little merit if the law should place those with them and those without them in the enjoyment of the like benefits. What appears desirable for a man's advantage, it is a virtue in him to do also for his progeny. The pauper's children would be themselves paupers, and the law would present to them every inducement to beget other paupers, and no inducement to refrain. Such we have seen the English pauper, slothful, thoughtless but of his parish pay, sometimes living to see three generations of his progeny paupers, like to or worse than himself.[2]

But the idle pauper cannot be supported except from those funds which must otherwise employ and reward the industrious. Every pauper, for his support, consumes that which would maintain or nearly maintain an industrious labourer; with this difference, that the consumption of the pauper is never repaid, whilst the value of the labourer's consumption is always reproduced with a profit, which again affords the means of employing other industry. The pauper, therefore, is constantly drawing those above him into his own rank. The misfortune of those reluctantly becoming paupers produces a sympathy which extends to the voluntary pauper, and the unfortunate and the idle become less and less distinguishable.

If the law increases its bounty with the number of the paupers' offspring, all these evils are aggravated and accelerated. If the law, like the former English bastardy law, renders the reward for having a bastard child greater than the allowance to a legitimate child, another source of immorality is opened, female virtue is at a disadvantage, and unchastity, becoming a source of profit, becomes respectable.[3]

---

[1] For a very ample detail of the state of mendicancy and vagrancy of private and public charitable institutions in the chief countries of Europe and in the United States, the reader is referred to the Appendix (F) of Foreign Communications made to the Poor-Law Commissioners, 1835, and especially to the interesting abstract of and comment upon these communications by Nassau W. Senior, Esq., entitled "A Statement of the Provision for the Poor, and of the Condition of the Labouring Classes, in a considerable portion of America and Europe," 8vo, Fellowes, 1835.

[2] See extracts from evidence received by the commissioners of enquiry:—"We have cases of three generations of paupers," p. 204. See at p. 218 an amusing instance of three generations of the same stock contemporaneously relieved, at the rate of L.100 per year, by a parish; see also pp. 220, 226, 358.

[3] See extracts from the information received by the commissioners of enquiry into the poor-laws. A clergyman in Cumberland speaks thus of the practice of that county:—"A very different description of women have of late years become the mothers of bastard children. Formerly it was confined to the daughters of cottagers and girls employed in farm-husbandry; but of late *very respectable farmers' daughters* have been in that situation, and have applied to have their offspring taken care of by the parish." (Captain Pringle's Report, p. 404.) The next extract is from the evidence of an overseer in the same county. "We at this time, in our parish, are sup-

Objections to Public Relief, &c.

If the law takes the yet more insidious course of providing relief to those who live partly by regular industry, the evils described are enormously increased. In this way the whole industrious population may be destroyed, almost without rendering the recipients conscious of their degradation. In this way the forethought of the industrious man becomes of as little value to him as it is to the pauper, and the whole of the restraints on population are destroyed in the great bulk of the people.

But relief to his workmen is in fact for the moment relief to the master; the public undertaking a portion of the maintenance of the servant saves to that extent the wages of the employer. The corruption of the system thus reaches the master as well as the labourer, and each is equally induced, by his immediate interest, to secure and continue to himself the portion of the benefit, unless we presume them to be more provident than the law itself.

That such bad principles might be involved in a poor-law, is undoubted; for although the English law never, either in letter or spirit, contained all these elements together, yet it at one period or another in succession contained them all, and a loose and in some measure a corrupt administration gave for a long time prevalence to all their influences together.

Evils of a bad administration of the poor-law.

This brings into view the evils of a bad administration of the law. Suppose its execution intrusted to officers who must, in a majority of cases, be necessarily ignorant of its complicate objects, being ignorant of the common rudiments of education;[1] and let such officers be in no way distinguished by their interests being made to accord with the interests of the community in a good administration; the obvious consequence must be such as were seen in England, that the best portions of the law must be badly administered, whilst the bad parts, by such instruments, can scarcely be expected to have these evils softened by a good administration. But a certain consequence would be, that those whose interests were identical with the welfare of the community, would be reluctant to serve the office, which would thus be left to others who could best employ its provisions to their own advantage. Thus in England the overseer was generally found, even when zealous in the discharge of his duty, blindly giving effect to the most pernicious part of the system. When merely weak, without being corrupt, we find him a tool in the hands of those whose object it was to procure labour at a low price, at the expense of the other rate-payers, and at the peril of the gradual though certain deterioration of the labourer and his posterity. Such an overseer was also subject, as a matter of course, to the cajolery or intimidation of the pauper, to the seduction of popularity, readily to be got by the expenditure in miscalled charity of other people's contributions. But the natural operation of the system was to find or to make its officers corrupt, as it was natural that that class of men should be readiest to execute the office whose circumstances best allowed them to avail themselves, for their own advantage, of the law. In England we found that the more pauperized the district, the more certainly was the overseer an employer of pauper labour, or a supplier to the paupers, on his private account, of the objects of their daily consumption, or the owner of the habitations in which they lived, and for which the parish guaranteed a certain and exorbitant rent.

Objections to Public Relief, &c.

Even these evils might be aggravated by parcelling the country out into districts too small to allow of the procuring of the necessary means even of an economical administration. In England few parishes or townships were large enough to afford a workhouse or to contract for the supply of the articles of consumption for the poor. Many were so small that the cost of purchasing small books of account was considered as an extravagance.

We have another important example of the way in which the administration could be carried to the extreme of badness; namely, by the provision of a control which could by its nature operate only to enforce an improvident administration, and which should have no authority to check it. England, again, affords us an example of such a device in the authority of the justices of the peace. The justice was enabled to enforce the giving of relief where the overseer from any motive had refused it; but the justice of the peace had no authority to interfere when the overseer was profligately allowing relief.

Effects of such a poor-law

The effects of such a system, then, would inevitably be the same as we have witnessed in England. Such have been perhaps too indiscriminately attributed to poor-laws generally. These effects were, in a former article in this publication,[2] very distinctly and ably described and elucidated. They were described, first, as a disturbance of the natural course of population, which they increased without reference to the means of support; and, indeed, in the inverse direction, inasmuch as every addition to the number of the non-productive or the partially productive paupers diminished the means of living of the other portions of the community. Secondly, as increasing the very pauperism which it was their object to relieve. Thirdly, as productive of improvidence in the poor, who saw no worse consequence of a dissolute and idle life than an eventual reliance, in common with millions of their fellow-subjects, upon the parish for their support in sickness or old age, or in the visitation of those calamities against which it is the task of prudence to provide. A fourth effect, much dwelt upon, was the misapprehension caused by these institutions as to the real cause of poverty and distress, and the operation of this misapprehension in producing a discontented spirit in those who entertain the notion that they have a right to relief, but no equally definite notion of their duty to provide for themselves. The fifth evil was the encouragement which the system, as administered, was found to give to every species of immorality: idleness in the day, depredation, poaching, and smuggling by night, facilitating the resort to the beer-shop again by day: particularly the law of bastardy was observed to be rapidly destroying the virtue of the females, and by producing ill-assorted marriages, sapping the whole of those domestic virtues, both of parents and children, which depend mainly on a happy home. It was also remarked that the law of settlement had a large effect in lowering the character of all who claimed a maintenance from the parish; it being notorious that the most steady, industrious, and moral workmen, upon whom the employer can place his surest reliance are those who do not legally belong to the parish in which they are living.

Such is the description of an extensive system of poor-laws framed on a bad principle, and badly administered; and such are their observed effects.

But it does not thence follow that a poor-law, well de-

---

porting two bastard children whose *mothers have landed property of their own*, and would not marry the fathers of their children." (Ibid.) "The daughters of some *farmers, and even landowners*, have bastard children. These farmers and landowners, and children with them, regularly kept back their poor-rate to meet the parish allowance for their daughter's bastard." (Ibid.) "Captain Pringle states that in the neighbourhood of Carlisle it was not unusual for the daughters of small farmers, or statesmen as they are here called (men farming their own property), to have bastard children, and to come to the parish for allowance." (Ibid., p. 403.)

[1] See as to the illiterateness, general ignorance, and inefficiency of overseers, the volume of extracts before cited, at the passage referred to in the index under the title "Overseers."

[2] By Dr Sumner, late bishop of Chester.

vised and well administered, should find no place in the polity of a nation.

There appear to be at least two resources besides that of adopting bad principles in such a law, or adopting a bad constitution of officers for its administration. The first resource is to exclude such an institution altogether.

Alternative of alms-giving.

Some few countries taking their place by common estimation amongst civilized nations, have made no public provision for the poor. Ireland was practically, before the session of 1837–38, without such a provision. England was in the same condition until the reign of Elizabeth. In all such countries rigorous enactments exist against mendicancy, but everywhere such enactments are defeated by the common co-operation of the whole people. It will be seen that in England the most ferocious penal enactments were repeated, with every variation that ingenuity could devise, for the purpose of suppressing mendicancy and vagrancy; and yet at every stage of legislation it is avowed that the evil was still increasing.

It appears a preposterous expectation that any people will generally sympathize or co-operate with the law which, whilst it leaves the unfortunate to perish, pretends to render mendicancy a crime. So common is the sentiment against such an attempt, that many systems of jurisprudence avowedly admit necessity, or the extreme danger of perishing for want, as a legal excuse for some offences, and as a palliation of any offence directly incited by the pressure of such necessity. There appears, therefore, no means of preventing mendicancy but by a recognised provision of public relief.

Mendicancy is often expressly permitted by law; sometimes it is allowed to particular classes of persons,—as discharged soldiers and sailors and their families, poor students, discharged prisoners, and such like. Sometimes a limit is assigned to begging, a given route on the way homewards, or a given district in which a party may have been born or may have become otherwise domiciled. Even in England both these kinds of license and restriction have, till within these few years, formed part of our statute-law. The effect of such restrictions has nearly everywhere been the same as in our own country,—viz., to give authority to mendicancy without in any way operating to diminish it.

Mendicancy compared with pauperism.

Let us now examine the effects of mendicancy, whether permitted by the law or not, comparing it throughout with the operation of a bad system of poor-laws. In the *first* place, it, like pauperism, destroys industry, but the mendicant is wholly and entirely idle, with no one responsible to see him set to work, and, being for the most part unknown to those who relieve him, is under no necessity even to affect, like the pauper, a readiness to work. The mendicant's progeny is like himself in this respect, except that, being early bred to the parent's habits, industry becomes nearly impossible to them; whilst the occupation of both is such, that even on the supposition that an inclination to adopt a life of industry should be excited, few occupations could be found to which they would be fitted, and still fewer employers who would engage them. In respect of the influences upon *industry*, therefore, the individual mendicant is under worse influences than the individual pauper relieved by the *worst* system of poor-laws. So with respect to the general *morality* of the mendicant. The pauper is under some restraints, owing to his being settled amongst neighbours upon whose good opinion he is at least in some measure dependent; he must be known to the officers of his parish, and by this alone is kept in contact with and in fear of the law. The local sphere for the exercise of his vices is one of narrow limits. These restraints keep the pauper under considerable subjection, both to law and to opinion. But no such restraints operate upon the mendicant. No irregularity of conduct, no vice, can exclude him more from general society than his daily mode of life already does; even if, amongst his fellows, any vice should be recognised as sufficiently repulsive to exclude him from their companionship, their unsettled life renders it impossible that the reputation of his odious qualities could very closely attend him. Add to this absence of restraint the positive encouragement given by their more various and adventurous life, the zest with which its frauds and its darings are performed, and the glory with which they are recounted,—these accompaniments have rendered the beggar's life popular as the subject of romance, and occasionally as the object of imitation amongst even the better educated and more fortunate members of society. A pauper was never yet, as the beggar often is, the romantic hero of a ballad or a legend. Here, again, the influences on the individual mendicant are more pernicious than those on the pauper.

The same disadvantageous comparison exists when we consider the unlimited opportunities afforded by the mendicant's mode of life for every species of petty theft and depredation; habits which appear invariably to accompany that of vagrancy.

Extent of mendicancy.

In England we have a difficulty in conceiving the extent to which the habits of mendicancy may be carried on, and the varieties in its practice. It would be comparatively a small evil that a few mendicants should be found to be pre-eminently vicious characters; and this evil would bear no comparison with the evil of a pauperism spread as widely as that formerly in England. But some estimate may be formed of the extent to which mendicancy may be carried where there are no poor-laws, by a reference to the state of Ireland, in which it is represented that, in a population of eight millions, not less than 200,000 habitual mendicants and vagrants existed in the years previous to 1838, and where this number was annually reinforced by the accession of the wives and families of those labourers who left their homes in search of work elsewhere, and which are represented, in the evidence collected by the Commissioners of Poor-Laws Inquiry in Ireland, to have exceeded a million of persons.

The evil of mendicancy, therefore, may even bear a comparison in the extent and number of those practising it with the evil of pauperism even under a bad poor-law.

Distributors of alms and of relief.

Now, let the operation upon the distributors in both cases be compared. No regular machinery is devised for the supply of the mendicant, but he is let loose upon the whole of society, to procure his living by every means by which the sympathies, the virtues, the follies, the weaknesses, or the vices of man may be attacked. Though much of the relief given to the mendicant is prompted by the benevolence of the giver, much also has its origin in sympathies falsely excited; in folly, and especially in the vanity and ostentation of him who dispenses the alms. Much, too, of the alms given to mendicants, in alms-giving countries, is given with the object of acquiring power over a disorderly and reckless class. In all countries, in times of commotion, we have seen this class unscrupulous instruments in the hands of those who, by their largesses, or by the exciting of expectations, had attached a large number of these classes. An example is seen in Spain, where the merit chiefly professed by the distributors of the alms of enormous charities is that of relieving the wants of armies of mendicants. No instrument in the hands of ambitious and designing persons has ever been found more effective than that of retaining large classes of ready-formed mendicants, and of bringing the poorer classes, under specious names, as near as possible to the condition of receivers of alms.

Another advantage which a system of poor-laws has over alms-giving is this: poor-laws are subject to the control of the legislature. Their evils, as discovered, may one by one be pruned away by the power which has created the whole institution; and they can also, at the will of the legislature, if such should appear to be an advisable course, be at any time totally abolished. Mendicancy, on the other hand, and alms-giving, are beyond the effective control of the law. Where once established by habit, no interference of the legislature can effectively modify them, no prohibition of the legislature can abrogate them. The sole corrective appears to be a retreat from private alms, by the adoption of a system of public relief as a means of discountenancing the mendicant's claim.

Thus far have been compared bad poor-laws with mendicancy, with the view to show that, even in this comparison, private alms-giving involves disadvantages greater than those attending a system of public relief. The comparison thus far with poor-laws has, as an abstract question, been unfair, because it seems possible, and recent experience appears to confirm the conclusion, that a poor-law may be so devised and so administered as to take away all plea for crime founded upon absolute necessity; to diminish no man's present motives to labour, and bring up his offspring to industry; to offer the least possible inducements to improvidence, so far as improvidence is involved in neglecting to make accumulations against old age and other calamities. This appears to be rendered possible by such an administration of relief that those capable of working would reject it, as less desirable than independent industry in the time of their health and vigour, and less desirable than any provisions secured by their own prudence for their old age.

CHAPTER II.

HISTORY OF ENGLISH POOR-LAWS TILL THE YEAR 1834.

The most authentic accounts, at least those which prove most incontestibly the prevalence of the habits of mendicancy and vagrancy in England, and give the best evidence of the extent to which their evils were recognised, may be found in the expressions of our early statutes.[1]

It will not be possible to give a detailed description, either of the contents of the series of our statutes or of their effects. The number of statutes passed for the suppression of vagrancy, mendicancy, and idleness, and for the relief of the poor, amount at the least to a hundred and eighty-seven; those now in force, commencing with the statute 43 Elizabeth, and including only the modifications of that law, amount to a hundred and eighteen, and contain matter of itself about equal to four average volumes of the statutes at large. None, therefore, but the most salient points in the legislation of the last four centuries and a half will be adverted to in the following summary of the progress of legislation upon these subjects.

traint
agran-

We first find indications of a general relaxation of the industry of our population in the reign of Richard II. Civil discord had unquestionably its effect in producing the result; but a change in the habits of the population had been produced by the increase of commerce and of communication with other countries, and a large accession had at this time been made to the disposable wealth of the community. The large system of vagabondage, sanctified by the name of pilgrimage, of which the expeditions known as the Crusades were the most salient instance, had begotten a spirit of restlessness and idleness in Europe, infecting even our insular population. It was not so much the habit of beggary as the desire of change and restlessness of life that the statute of 12th Richard II., chap. 7, passed in the year 1388, was intended to repress. This statute, though entirely directed against habits characterized in that day as vagabondage, scarcely recognises beggary as an habitual pursuit. Its main provisions are confined to the object of restraining labourers from changing their abodes. It prohibits any labourer from departing from the hundred, rape, wapentake, city, or borough where he has dwelling, without a testimonial showing reasonable cause for his going, to be issued under the authority of the justices of peace. Any labourer found wandering without such letter is to be put in the stocks till he find surety to return to the town from whence he came. So far are its enactments from affording any evidence that able-bodied persons of either sex exercised by choice to any large extent the trade of mendicancy, that the only other class besides labourers which it recognises are the impotent. As to impotent persons, it provides that they are to remain in the towns in which they be dwelling at the time of the act; or if the inhabitants are unable or unwilling to support them, they are to withdraw to other towns within the hundred, rape, or wapentake, or to the towns where they were born, and there abide during their lives.

Restraint of begging.

From the earliest periods, but from this time especially, begging was an offence; yet the chief enactments of the two succeeding centuries are rather confined to the object of restraining the movements of labourers than to the restraining of able-bodied beggars. The provisions of the 11th Henry VII., chap. 2, however, require beggars not able to work to go to the hundred where last they dwelt, or were best known, or born, without begging out of the hundred. The 19th Henry VII., chap. 12, passed eight years afterwards (in 1504), requires them to go to the town, city, or hundred where they were born, or to the place where they last abode for the space of three years, without begging out of the said city, town, hundred, or place.

The legislation affecting the classes of poor least able to provide for themselves had thus far been entirely restrictive, and contained that element of the poor-laws by which they are connected with police, almost to as great an extent as is to be found in our most recent institutions. They also indirectly contain a complete settlement law; for, by confining the labourers, but especially the impotent poor and beggars, to the places in which they dwelt at the time of the act being passed, or in which they had been born, or to the places of their last abode, they directly settled such persons on the places thus defined, and rendered the districts chargeable with the burden, at least to the extent to which the endowments of the church and the benevolence of individuals could be applied to the purpose. At length, especially after all the revenues of the church were diverted from the purpose of maintaining the poor, legislation becomes of a severe penal character, and is more immediately directed against those who practise mendicancy as a trade, viz., "able-bodied, sturdy, and valiant beggars." At the same time, the distinction becomes more apparent between the impotent poor and those whom the legislature evidently regarded as voluntary poor, and whom the law now subjects to heavy and even sanguinary penalties. The 22d Henry VII., chap. 12, passed in the year 1531, directs the justices to assign to the impotent poor a limit within which they are to beg. An impotent person begging out of his limit is to be imprisoned for two days and nights in the stocks, fed on bread and water, and then sworn to return to the place in which he was authorized to beg. An able-bodied

Settlement law.

---

[1] The whole history and successive characters of English vagrancy and mendicancy, and of the legislative efforts to restrain them, may be traced from the seventh century downwards, in the extracts from Saxon, Danish, Norman, and English laws, and a great number of contemporaneous evidences given at length in the Appendix to the Report on the Law of Settlement and Removal of the Poor, House of Lords papers, 1851 (101).

beggar is to be whipped, and sworn to return to the place where he was born, or last dwelt for the space of three years, and there put himself to labour.

Compulsory relief.

Thus far restrictions upon vagrancy, whether originating in misfortune or idleness, or more serious vice, had proved unavailable. The evil had not been repressed; it had evidently increased, and at length drove the legislature to the adoption, not only of severer penalties, according to the old policy, but of a new expedient.

With imperfect machinery for giving effect to its intentions, without security that where its intention was carried into effect evils greater than those against which it was intended to provide might not arise, a system was now created which, in all its policy, is identical with that which now exists in England, and was introduced into Ireland in 1838. The means employed, and not the policy itself, alone distinguish the legislation of the two periods. In the first place, beggary and vagrancy are still to be repressed, but no one is to be driven, by absolute destitution, to an infraction of the law; all excuse is to be taken away from the beggar. In the next place, the sympathy of the community with the law is to be secured by a provision at the public expense against the evil consequences of individual destitution. In the last place, the compulsory provision thus made by the community is to be protected by compelling those capable of exertion, and seeking to avail themselves of it, to accept it subject to the condition of working for the maintenance thus secured to them; a condition obviously intended to be as hard or harder than that upon which the independent man obtains his own support, and rendering the alternative of independent industry preferable to that of dependence on the public charity.[1]

The 27th Henry VIII., chap. 25, passed in the year 1536, recites the act last mentioned, and adds, that no provision is made for the support of the impotent, nor for the setting and keeping in work of valiant beggars; and then enacts, that the land-officers of every city, shire, town, and parish, to which such poor creatures or sturdy vagabonds shall repair, in obedience to that act, shall most charitably receive the same, and shall keep the same poor people by way of voluntary and charitable alms, within the respective cities, shires, towns, hundreds, hamlets, and parishes, by their discretion, so that none of them, of very necessity, shall be compelled to beg openly, and shall compel the said sturdy vagabonds and valiant beggars to be kept to continual labour, in such wise as they may get their own living by the continual labour of their own hands, on pain that every parish making default shall forfeit twenty shillings a month. Alms-giving otherwise than to these common boxes, or common gatherings, or to fellow-parishioners, or prisoners, is prohibited on forfeiture of ten times the amount given. A sturdy beggar is to be whipped the first time, his right ear cropped the second time; and if he again offend, he is to be sent to the next jail till the quarter sessions, and there to be indicted for wandering, loitering, and idleness; and if convicted, *shall suffer execution of death as a felon*, and an enemy of the commonwealth.

As far as the policy of the succeeding legislation is concerned, its intention appears to be fully expressed by the terms of this statute. In all the succeeding period we find a very large variety of means adopted for the purpose still of giving effect to the same policy; sometimes an increase of severity, even beyond the rigour of this statute, against the beggar and vagrant; sometimes an improved machinery for succouring the impotent, especially for the assessment and levying of the funds, and for producing an effective responsibility in the officers charged with this duty; and eventually a more comprehensive system devised for effectuating the whole of the objects clearly contemplated by the statute of Henry, without the adoption of any other than those objects, but intended merely to prevent the evils resulting from the defective means and instruments previously employed for their attainment.

Accordingly we find in the statutes of the reign of Edward V., "the foolish pity and mercy of them which should have seen to the execution of the goodly laws before enacted, and the perverse nature and long-accustomed idleness of persons long given to loitering," inveighed against in the usual declamatory manner of preambles of that period; but we find indications of the growth of a conviction that the excessive penalties of the previous legislation had defeated the operation of the law. The enactments against vagrancy are therefore rendered somewhat milder; an able-bodied poor person who does not apply himself to some honest labour, or offer to serve, though only for meat and drink, if nothing more is to be obtained, shall be taken for a vagabond, branded on the shoulder with the letter V, and adjudged a slave for two years to any person who shall demand him, to be fed on bread and water and refuse meat, and caused to work by beating and chaining, or otherwise. If he run away within that period, he is to be branded on the cheek with the letter S, and *adjudged a slave for life*; if he run away again, he is to suffer *death as a felon*. If no one demand such loiterer, the place where he is born is to keep him as a slave, and is to see him set to work; and if it fail in this, it is to be mulcted in a penalty, a city forfeiting five pounds, a borough forty shillings.

Removals.

By this statute the old settlement law had ingrafted on it a law of removal. The taking surety of the impotent poor, that they would repair to the places where they were born, or had dwelt for the last three years, had been found ineffectual; the officers were therefore directed to convey the impotent poor on horseback, in cart, chariot, or otherwise, to the next constable, and so from constable to constable, till they be brought to the place where they were born, or most conversant for the space of three years, there to be kept and nourished of alms.

Gradual improvements were introduced in the detail by several successive statutes. The 3d and 4th Edward VI. provides for the keeping of a book in every city, corporate town, and parish, containing the names of householders and of the impotent poor. It makes some approach to a special organization of officers for the objects. The minister and churchwardens are to appoint collectors of alms; the alms, however, are voluntary, except to the extent to which they can be enforced by the exhortation of the minister and bishop: it being provided, that if any one able to further this charitable work do obstinately and frowardly refuse to give, or do discourage others, the minister and churchwardens are to exhort him gently. If he will not be so persuaded, the bishop is to send for him to induce and persuade him by charitable ways and means, and so, according to his discretion, to take order for the reformation thereof. These provisions being made, beggary is still prohibited, upon the pains limited in the previous statutes.

---

[1] With regard to the erroneous impression until recently prevalent in England, that poor-laws were institutions peculiar to this country, it is important to observe that the system of law for repression of mendicancy and relief of the poor here described, was a direct and palpable imitation of a continental institution. Six years before the enactment of the 27th Henry VIII. (that is, in the year 1530), the magistrates of Ypres in Belgium enacted a set of regulations, which, as stated by Mr Hallam, manifestly form the model which was followed a few years afterwards by the legislature of this country. The regulations in question appear to have been adopted in the adjacent provinces of the Netherlands under the sanction of an edict of Charles V. (See a paper by Mr Hallam in the first volume of the Transactions of the Statistical Society.) The still earlier legislation of the Romans may be traced from the provision for the *lex frumentaria* of the younger Gracchus all through the subsequent period of the republic and the empire both in the West and East. The ecclesiastical provisions of the middle ages were only too ample, and are traceable with equal ease and fulness. (See Pashley on Poor-Laws, 1852, chap. iv.) The yet earlier legislation of the Greeks has left frequent traces to be found, especially in the Attic orators. A very amusing illustration is to be found in the oration of Lysias, *Ὑπὲρ τοῦ ἀδυνατοῦ*. (See Boeck Staatsh, i. 343.)

Compulsory tax.

As might be expected, the gentle askings of the collectors, and the exhortations of the minister, the charitable ways and means of the bishop, appear to have been without effect in persuading the parishioners to intrust to the collectors the distribution of their alms. We find, therefore, twelve years afterwards (5th Elizabeth, chap. 3, passed in 1563), an attempt made to give additional effect to these provisions, by enabling the bishop to bind any person to appear at the next sessions, if his froward and wilful mind should obstinately refuse to give weekly relief to the poor according to his ability. Here the justices are to come in to the aid of the bishop, and are charitably and gently to persuade and move the said obstinate person to extend his charity. If he will not be persuaded, the justices with the churchwardens may tax the obstinate person according to their discretion; and on his refusal to pay, the justices, on the complaint of the churchwardens, are to commit him to jail until he does pay the sum taxed, and arrears. Thus was created a compulsory tax, though at first only as an alternative where voluntary contributions were refused.

The important statute, 14th Elizabeth, represents in its recitals, that "all parts of this realm of England and Wales be presently with rogues, vagabonds, and sturdy beggars exceedingly pestered, by means whereof daily happeneth in the same realm horrible murders, thefts, and other great outrage." The sense of these evils seems to have dictated a resort to a new variety of punishments; all persons defined in the act as rogues and vagabonds, or sturdy beggars, are for the first offence to be grievously whipped and burned to the gristle of the right ear with a hot iron, of the compass of an inch about; for the second, they are to be deemed felons; for the third, to suffer death as felons, without benefit of clergy. But now chiefly is to be observed the improvements in assessing the burthen; the justices having power to settle the poor for their abidings, and to set down what portion the weekly charge towards the relief and sustentation of the poor people would amount unto, and that done, shall by their good discretions tax and assess all the inhabitants dwelling within the divisions limited for the settling of the poor.

License to beg.

This statute contained, like some of its predecessors, an enactment giving a limited license for begging, provided that the poor people ask relief of victualling only in the same parish where they do dwell, so the same be at the time and in the manner directed by the churchwardens and overseers of the poor. This license has been extended, modified, and restrained, but still kept in existence, especially in the case of discharged soldiers and prisoners, up to recent times.

43 Eliz. cap. 2.

So far we have seen the gradual accumulation of all the elements contained in the poor-laws up to the time of the last amendment in the system made in the reign of the late King William IV. The statute which permanently fixed all these elements in one system was passed in the last year of the reign of Elizabeth, the celebrated statute the 43d Elizabeth, chap. 2. In this statute we find extreme severity abandoned, and its place supplied with a reasonable test of destitution of such as may be presumed to be voluntary beggars or idlers. The able-bodied, married or unmarried, are to be set to work; children may be apprenticed; only the "lame, impotent, old, blind, and such others among them, being poor and not able to work," are to have "necessary relief," without being set to work. For the latter class of poor, habitations may be provided at the expense of the parish, on the waste or common; and for the support of these, but not of any who are able to work, natural relations, that is, father, mother, grandfather, grandmother, and children, may be compelled to contribute.

The voluntary contribution, and the co-operation of the minister and bishop, are abandoned. A tax upon the inhabitants, and upon the occupiers of property, strictly defined, and upon the parson or vicar, is directed to be levied in every parish; effectual means are given for the assessment, collection, and levy of the tax; for appeal for remedy against its unjust assessment; for the contribution of adjoining parishes and hundreds, where the means of the single parish failed; above all, a special authority is created for giving effect to the provisions of the law. Overseers, not less than two, nor more than four, are to be appointed in every parish yearly, in Easter week, to act with the churchwardens, subject to the orders of the justices, and liable to penalties for neglect of their office.

Such was the system in operation for above two centuries and a quarter, from 1601 to 1834, without material modification: its whole provisions were extended in the reign of Charles II. to town-lands; the law of settlement was also extended and refined, in the same and subsequent reigns; and the provision for setting the able-bodied to work was rendered more effectual by the 9th George I. chap. 7, which enabled every parish to provide a workhouse, or, if too small or too poor, to combine with others for the purpose of maintaining a workhouse, and which rendered the offer of relief in a workhouse a sufficient bar to the claim to any other relief.

Diminution of vagrancy.

These statutes, aided by all those other causes which operated upon the morals and the general prosperity of the people, had produced the effect intended by their authors; and whatever may have been the portion attributable to any of the several causes in operation, the result unquestionably was, that vagabondage and idleness were found in the last half of the last century to prevail in England to a less extent than in any of the larger states of Europe, with the single exception of Holland. As the extremity of the evil had formerly produced severity in the law, so the disappearance of the evil produced a disastrous relaxation in the restrictions of which the experience and prudence of the previous times had discovered the necessity.

Relaxation of the law.

About the middle of the last century, there began to be indicated in the acts of the legislature a growing opinion, that the severity of the tests applied to the recipients of public charity required to be diminished. In the 7th year of the reign of George III., guardians were especially appointed in the city of London, the city of Westminster, the bills of mortality, the liberties of the Tower, not with any administrative or executive powers, but "to guard against the dangerous consequences which may arise from the false parsimony, negligence, inadvertency, or the annual change of parish officers." These guardians were to protect the poor children of the metropolitan districts to which the act applied, by visiting the places in which they were kept, reporting on their condition, and calling on the assistance of the magistracy where it might seem necessary.

Throughout the whole of the reign of George III. the example thus set was followed by constantly succeeding and increasing relaxations of the rigour of the old law; some of the most conspicuous instances of which are to be found in Gilbert's act, passed in the twenty-second year of that reign, 1782, which, instead of rendering the workhouse a means of testing voluntary pauperism, by employing the able-bodied, thereby deterring them from habits of pauperism, by rendering their state less eligible than one of independence, reverses this principle entirely. It confines the use of the workhouse to that of a mere receptacle for the aged, impotent, and infant poor; expressly provides, that the able-bodied shall not be required to enter it; and proceeds to the absurd extent in favour of the able-bodied pauper, of compelling the guardians appointed under the act to find work near their own houses, for all applicants able and professing to be willing to work, but unable to get employment; and to make up any supposed deficiency of wages out of the poor-rates.

The evils of able-bodied pauperism were now proceeding with alarming rapidity. The consummation of the false policy of the legislature during this reign was attained in East's act, 55 Geo. III. chap. 137 (passed 1815). It consists of a complete abrogation of almost all the salutary portions of the 9th Geo. I. chap. 7. The relief was no longer required to be received in the workhouse, it was to be *paid* to any poor person or persons at his or her or their home or homes, house or houses. Justices were empowered to order this relief for any time they might be pleased to define, not exceeding three months; and two justices might make subsequent orders for relief for a period not exceeding six months. The preambles and recitals in this statute consist, as might have been anticipated from the previous course of legislation, of descriptions of the grossest disorders on the part of those maintained by the public charity.

The insolence and general demoralization of the pauper, the most alarming deterioration in the industry of the labouring classes, especially the agricultural labourers of the south of England, the unscrupulous interference of the employers with the wages and the mode of remuneration of the employed, were abundantly shown by the committees of both houses of parliament, appointed to inquire into the progress of the poor-laws, especially by that appointed on the motion of Mr Sturges Bourne (in 1817), and upon the report of which the act known as Sturges Bourne's act (59 Geo. III., c. 12) was founded. This act does not entirely abandon the views which dictated the dangerous provisions of East's act. Generally, however, it was a salutary measure, providing for the election of bodies of persons called select vestries, who were to supersede the overseers, and, in some measure, the justices, more effectually to avoid the evils consequent upon the administration being intrusted to annual and unpaid officers. It made provision also for the performance of the overseers' duties, by paid and permanent assistant overseers.

From the end of George III.'s reign to the year 1834, though legislative changes were not unfrequent, they were confined to matters of detail, involving neither the abandonment nor the adoption of any important principle.

CHAPTER III.

EFFECTS OF POOR-LAWS IN ENGLAND.

Commission of Inquiry.

Effects of previous legislation.

In the course of the foregoing description of some of the principal statutes, the useful or injurious principles involved in them have been shortly referred to; the effects operated by the working out of those principles have been less remarked upon.

Beneficial effects.

In the main, the *good effects* had consisted in reclaiming from a vagrant and profligate course of life a large proportion of the population. The settlement laws especially had been instrumental in this; for we find that the creation of the claim to relief from the parish funds had so far attracted the idle and dissolute from the practice of common begging, that, in the reign of Charles II., after a period of great commotions, when many disbanded soldiers and sailors, and others, who, in a period of turmoil, are either forced upon or voluntarily resort to an unsettled life, had much swelled the mass of those who in previous times would have been found in the ranks of sturdy and valiant beggars, the same order of people were now found to be systematic though rapacious paupers, making the parish fund the means of levying their contributions on society.[1]

Operation.

We find in a statute of Charles II. in the second year of the Restoration (13 and 14 Car. II. cap. 12), a multifarious law of settlement created, upon reasons thus expressed in the recital: "Whereas, by reason of some defects in the law, poor people are not restrained from going from one parish to another, and therefore *do endeavour to settle themselves in those parishes where there is the best stock*, the largest commons or wastes to build cottages, and the most woods for them to burn and destroy; and when they have consumed it, then to another parish; and at last become rogues and vagabonds, to the great discouragement of parishioners to provide stocks, where it is liable to be devoured by strangers." From this period the whole of the efforts of the legislation are incessantly made to prevent the too easy settling of the poor upon the parish; but they all equally prove that settled pauperism had more and more taken the place of vagrant mendicancy.

If to the poor-laws can be attributed this good effect, they must also necessarily have the credit of preventing that train of evils which follows upon the existence of a large mass of mendicants and vagrants in any community. The corruption, the demoralization, the inevitable bodily misery, to the mendicant himself, his connections, and his offspring; the extortion, depredation, and the more violent crime which such a class have almost unlimited opportunity and frequent temptation to commit; next the deterioration in the feelings and habits of those whom circumstances may bring in contact with them; the refuge which they afford to all who are inclined or tempted to fall off from the more steady and respectable occupations of life, many of whom are even tempted by the mere spirit of adventure to become recruits; add to these the alarm and practical annoyance, which renders the industry and morality of all other classes less a security for enjoyment; and we have some idea of the train of evils which was cut off when vagrancy on the great scale was at length, in England, successfully suppressed, to be replaced in a great measure by voluntary pauperism.

Injurious effects.

The *bad effects*, as they arose in detail, usually led to the successive modifications which we find the law in its progress undergoing from time to time. Many of the evils temporarily and partially felt might even now be described with advantage, and as warnings to future legislators; but generally their interest would at present be greater to the historian and antiquary than in a practical point of view. At no period had these laws attained such an influence on the interests of the community of England and Wales, as about the years 1831 and 1832, when the effects of the whole system had reached a greater height than had ever yet been attained.

In these years many of the anticipations of those who had seen the evil tendency of the poor-laws, and had prophesied that the results of the system must be disastrous, were realized in such a way as to produce a conviction in the most supine, that either a remedy must be applied, or a wide-spread ruin be submitted to. In an article in this work, written in the year 1823, by one of the most humane and enlightened men who had ever given their attention to the subject, it was shown that a crisis was impending, and could not be far removed; that, as the law then stood, the poor-rates were increasing in the same ratio in which the prudence and forethought of the receivers of relief were being destroyed. It was shown, that "whenever the charge upon the land in support of those who do not add enough to the annual produce of the country to support themselves is so great that the land can be no longer cultivated with profit, then of course it will be thrown up." In 1832 was seen the phenomenon of whole parishes of fertile land being abandoned, "the landlords giving up their rents, the farmers their tenancy, the clergyman his glebe and the tithes." We find the paupers assembled and refusing to accept of the offer of the whole land of the parish, avowing that “they liked the present system better.”[1]

---

[1] See Report on the Law of Settlement and Removal, 1851, pp. 40–43, and the passages in the Appendix there referred to.

In the article referred to, it had been shown that the system then in operation was fraught with the danger of discontented turbulence. “Every one is brought up with the belief that the state is bound to provide him with employment and support. When, therefore, the employment assigned him is such as he does not approve, and the recompense awarded him falls below his expectations (and when the employment is a loss to the public, the recompense must often be below even reasonable expectations), he becomes an irritated and uneasy subject; and, unless he is restrained by the fear of detection, or by the better influence of moral principles, he vents his spleen by any mischief that is in his power, and the burning of stackyards, or the destruction of machinery, results from an unsatisfactory interview with the overseer, or an ineffectual appeal to the bench of magistrates.”

In the winter of 1831–1832 we find the practical exemplification of these remarks. In a period of great general prosperity, we find that portion of England in which the poor-laws had had their greatest operation, and in which by much the largest expenditure of poor-rates had been made, the scene of daily riot and nightly incendiarism; and we discover a state of things which, in the sober language of statistics, is thus described: “Of ninety-three parishes in four ill-administered counties, the population is 113,147, and the expenditure L.81,978, or fourteen and fivepence per head; and of eighty parishes in three well-administered counties, the population is 105,728, and the expenditure L.30,820, or five and ninepence per head; and those counties in which the expenditure is large are those in which the industry and skill of the labourers are passing away, the connection between the master and servant has become precarious, the unmarried are defrauded of their fair earnings, and riots and incendiarism have prevailed. The three counties in which it is comparatively small are those in which scarcely any instance of fire or tumult appears to have occurred; in which mutual attachment exists between the workman and his employer; in which wages depend not on marriage, but on ability, and the diligence and skill of the labourers are unimpaired or increased.”

The danger had become too real to be neglected if a remedy could be found; but parliamentary inquiries, both in the upper and lower house, had repeatedly taken place comparatively without result, the largest effect produced by any committee of either house being that of the committee appointed in 1817, which in the year 1819 produced Sturges Bourne’s act; an act, as events proved, almost wholly unproductive of effect in checking the course of pauperism.

An effort of another kind was now felt to be necessary, and was accordingly made. A Commission of Inquiry was appointed, consisting of individuals remarkable alike for their interest in the subject and their knowledge of its principles and details; its powers, though only those of ordinary commissioners of inquiry, far exceeding, for useful purposes, those of a parliamentary committee. Its labours were continued incessantly for two years, uninterrupted by the vacation or recess. Nor were these confined alone to the examination of witnesses summoned from different parts of the country. The commission were enabled to examine the locality itself, the documentary evidence, the living witnesses, and the actual operation of the system on the spot, and this by the members of their own body, as well as by assistant-commissioners appointed to visit and examine all parts of the country, some of whom extended their inquiries into Scotland, France, Flanders, and Guernsey, whilst they also collected a vast mass of interesting evidence from our ambassadors and diplomatic agents in different countries of Europe and America.

The result was a scrutinizing and minute inquiry; which was followed by the suggestion of amendments in the law, the practical deductions from the experience, yet so systematic, that their operation could be calculated almost with certainty, and which were, therefore, proportionally to be relied upon. As the success in inquiring had been great, so was the confidence of the legislature readily given; and the most important statute upon the subject passed since the statute of Elizabeth was carried through both houses by large and confident majorities.

A description of the evils found in operation at the time of the inquiry, of the remedies proposed for those evils, and of the enactments actually adopted, will afford the most complete and consistent view of the present system of English poor-laws. The statement of the operation of the previous law, and of the remedies proposed, will be condensed from the Report of the Commissioners of Inquiry; that of the enactments passed, from the Act for the Amendment and better Administration of the Laws relating to the Poor in England and Wales, being 4 and 5 William IV. cap. 76.

The poor entitled to relief consist, *first*, of those who are impotent through old age or bodily infirmity, through infancy, through accident, or through mental infirmity; and, *secondly*, of the able-bodied poor.

I.—RELIEF OF THE ABLE-BODIED.

It was in the relief of the able-bodied that the greatest pecuniary expenditure, and, above all, that the greatest moral evils, were incurred. The relief granted was in a great measure unconditional; in many districts it had superseded the necessity of practising even the thrift and husbandry necessary in expending the funds placed at the pauper’s disposal.

The great source of abuse was found to be the out-door relief afforded to the able-bodied on their own account, or on that of their families. This was given either in kind or in money.

1. *Out-Door Relief of the Able-Bodied in Kind.*

The out-door relief of the able-bodied, when given in kind, was found to consist rarely of food, rather less unfrequently of fuel, and still less unfrequently of clothes, particularly shoes; but its most usual form was that of relieving the applicants, either wholly or partially, from the expense of obtaining house-room. This last mode of relief was extensively prevalent, and productive of important consequences, both direct and indirect.

Partial relief from the expense of obtaining house-room was given, or professed to be given, whenever the occupant of a cottage or an apartment was exempted on the ground of poverty from the payment of rates. In a great number of cases the labourer, if a parishioner, was not only exempted from rates, but his rent was paid out of the parish funds.

2. *Out-Door Relief of the Able-Bodied in Money.*

The out-door relief afforded in money to the able-bodied on their own account or on that of their families was found to be still more prevalent. This was generally effected by one or other of the five following expedients, which may be concisely designated as, first, relief without labour; secondly, the allowance system; thirdly, the roundsman system; fourthly, parish employment; and, fifthly, the labour-rate system.

Relief without Labour.—By the parish giving to those who

---

[1] See, as to the parish of Cholesbury in Berkshire, the Report from his Majesty’s Commissioners for Inquiring into the Administration and Practical Operation of the Poor-Laws, 8vo Fellowes, 1834. See also instances in Warwickshire, in Mr Villiers’s Report, in Appendix (A).

Operation.

Operation.

were or professed to be without employment, a daily or a weekly sum, without requiring from the applicant any labour.

Sometimes relief, to an amount insufficient for a complete subsistence, was afforded, without imposing any further condition than that the applicant should shift, as it was called, for himself, and give the parish no further trouble. In a still greater number of instances the relief was found to have been given on the plea that the applicant had not been able to obtain work, that he had lost a day or a longer period, and was entitled, therefore, to receive from the unlimited resources of the parish what he had not been able to obtain from a private employer.

Allowance.—By the parish allowing to labourers who were employed by individuals, *relief in aid of wages.*

In some places allowance was found to have been given only occasionally, or to meet occasional wants; to buy, for instance, a coat or a pair of shoes, or to pay the rent of a cottage or an apartment. In others, it was considered that a weekly sum, or more frequently the value of a certain quantity of flour or bread, was to be received by each member of a family.

The latter practice was found to have been sometimes matured into a system, forming the law of a whole district, sanctioned and enforced by the magistrates, and promulgated in the form of local statutes.[1] The allowance fixed by these scales was usually called *bread-money.* Of this kind of relief it was observed, that

" No attention was paid to either the character of the applicant or the causes of his distress. In fact, he was considered as entitled to it without pleading any distress.

" The *bread-money* was hardly looked upon by the labourers in the light of parish relief. They considered it as much their right as the wages they received from their employers, and, in their own minds, made a wide distinction between ' taking their *bread-money*' and ' going on the parish.' "

It was further to be observed, that even in those parishes in which the amount of allowance was supposed to depend upon that of the applicant's earnings, the inquiry as to the amount of those earnings was never carried back further than the current or the previous week or fortnight. The consequence was, that many of those who at particular periods of the year received wages far exceeding the average amount of the earnings of the most industrious labourer, received also large allowances from the parish.[2]

Again, there were other parishes in which no sort of inquiry whatever was made respecting earnings; but the birth of a child endowed the parent with an allowance, whatever might have been his previous income.[3] It was to be observed, also, that under the *scale system* a child was very soon considered as an independent claimant for relief, and entitled to it, though residing with his parents, and though they might have been at full work on high wages.[4]

The Roundsman System.—By the parish paying the occupiers of property to employ the applicants for relief at a rate of wages fixed by the parish, and depending not on the services but on the wants of the applicants, the employer being repaid out of the poor-rate all that he had advanced in wages beyond a certain sum. This was the house-row, or roundsman, or billet, or ticket, or stem, system.

According to this plan, the parish in general made some agreement with a farmer to sell to him the labour of one or more paupers at a certain price, and paid to the pauper out of the parish funds the difference between that price and the allowance which the scale, according to the price of bread and the number of his family, awarded to him. It had received the name of the billet or ticket system, from a ticket signed by the overseer, which the pauper in general carried to the farmer as a warrant for his being employed, and took back to the overseer, signed by the farmer, as a proof that he had fulfilled the conditions of relief. In other cases the parish contracted with some individual to have some work performed for him by the paupers at a given price, the parish paying the paupers. In many places the roundsman system was effected by means of an auction.[5]

Parish Employment.—By the parish employing and paying the applicants for relief.

The 43d Elizabeth does not authorize relief to be afforded to any but the impotent, except in return for work. And much as this part of the statute had been neglected, its validity was still recognised by the judges. In the King *v.* Collett, 2, Barnewell and Cresswell, 324, Lord Tenterden decided it to be the duty of overseers to provide work, if possible, before they afforded relief. And whatever might have been the difficulty of finding *profitable* work, one could scarcely suppose the existence of a parish in which it would not be *possible* to provide some work, were it merely to dig holes and fill them again. But though such was the law, it appears, from the parliamentary returns, that payment for work was the most unusual form in which relief was administered. The poor-rate returns for the year ended the 25th of March 1832 state, that out of L.7,036,968 expended in that year for the relief of the poor, less than L.354,000, or scarcely more than one twentieth part, was paid for work, including work on the roads and in the workhouses. This might easily be accounted for.

---

[1] " *Town of Cambridge.*—The churchwardens and overseers of the poor are requested to regulate the incomes of such persons as may apply to them for relief or employment, according to the price of fine bread, namely,

" A single woman, the price of...3½ quartern loaves per week.
" A single man........................4½ ... ditto.
" A man and his wife.................8 ... ditto.
" A man and his wife and one child...9½ quartern loaves per week.
" Ditto ditto and two children......11 ... ditto.
" Ditto ditto and three ditto.........13 ... ditto.

" Man, wife, four children and upwards, at the price of 2½ quartern loaves per head per week.

" It will be necessary to add to the above income in all cases of sickness or other kind of distress, and particularly of such persons or families who deserve encouragement by their good behaviour, whom parish-officers should mark both by commendation and reward.

" By order of the magistrates assembled at the town-hall, Cambridge,—A Chevell, clerk to the magistrates.—*Nov.* 27, 1829." (Report, p. 22.)

[2] Mr Bishop found a parish in the Bedford Level, in which a recently drained tract of fertile land requires more labour than the settled inhabitants can provide, and the average yearly earnings of a labourer's family are from L.60 to L.70; but during a frost, and generally from November to March, almost every labourer comes on the parish. When they commented on these facts in their conversation with a resident magistrate, his answer was, " Why, what are we to do? they spend it all, and then come and say they are starving; and you must relieve them." " In our vestry," says Mr Russell, " which meets every Monday, the calculation is confined to the earnings of the past fortnight. No further retrospect is ever taken either for or against the claimant. In some parishes I believe the account is settled once a week instead of once a fortnight." Sometimes the inquiry does not go back even to the beginning of the week at the end of which the claim is made. (*Ibid.* p. 29.)

[3] In the northern division of Devonshire, says Mr Villiers, " The practice of granting allowance for children is so general and confirmed, that the pauper is in the habit of giving formal notice to the overseer of the pregnancy of his wife. Should the overseer refuse the application for the fixed sum allowed for the second, third, or fourth child, the magistrates' single inquiry, on his appearance before them under a summons, would have been as to the custom of the parish or the hundred. ' At what number does allowance begin with you?' was the common mode of putting the question, as I was repeatedly assured by overseers. The previous or present earnings of the pauper, or of any of his family, were never mentioned." (*Ibid.* p. 31.)

[4] At Friston, Suffolk, Mr Stuart states that " a child is entitled to relief at the rate of three shillings a week on his own account from the age of fourteen." " At Bottisham, Cambridge," says Mr Power, " a boy of sixteen receives two shillings and sixpence for the week; he lives at home with his father; the family consists of his father, mother, brother, and himself. Seventeen is the age at which a young man is considered entitled to separate relief as an unemployed labourer; his pay then is three shillings and sixpence. The allowance to our single young men out of employ used to be two shillings and tenpence; according to scale, four quartern loaves, present price eightpence-halfpenny. Last November they came to the sessions in a body to complain of the insufficiency, and it was then raised to three shillings and sixpence. This sum they receive when above a certain age, although residing with their families." (*Ibid.* p. 31.)

[5] Mr Richardson states that, " in Sulgrave, Northamptonshire, the old and infirm are sold at the monthly meeting to the best bidder, at prices varying, according to the time of the year, from one shilling and sixpence a week to three shillings; that at Yardley-Hastings, all the unemployed men are put up to sale weekly; and that the clergyman of the parish told him that he had seen ten men the last week knocked down to one of the farmers for five shillings, and that there were at that time about seventy men let out in this manner out of a body of 170." (*Ibid.* p. 28.)

In the first place, to afford relief gratuitously proved less troublesome to the parochial authorities than to require work in return for it. Wherever work was to be paid for, there must have been superintendence; but where paupers were the work-people, much more than the average degree of superintendence was necessary. In ordinary cases, all that the superintendent inquired was, whether the workmen had performed an average day's work; and where the work was piece-work, he needed not make even that inquiry. The practice of his trade fixed the market-price of the work, and he paid it without asking whether the workman had been one hour or one day in performing it, or whether it exceeded or fell below his wants. But the superintendent of pauper labourers had to ascertain, not what was an average day's work, or what was the market-price of a given service, but what was a fair day's work for a given individual, his strength and habits considered; at what rate of pay for that work, the number of his family considered, he would be able to earn the sum necessary for his and their subsistence; and, lastly, whether he had in fact performed the amount which, after taking all these elements into calculation, it appeared that he ought to have performed. It will easily be anticipated that this superintendence was very rarely given; and that in far the greater number of instances in which work was professedly required from paupers, in fact no work was done. In the second place, collecting the paupers in gangs for the performance of parish work was found to be more immediately injurious to their conduct than even allowance or relief without requiring any work at all. Whatever might have been the general character of the parish labourers, all the worst of the inhabitants were sure to be amongst the number; and it is well known that the effect of such an association is always to degrade the good, not to elevate the bad. It was amongst these gangs, who had scarcely any other employment or amusement than to collect in groups, and talk over their grievances, that the riots of 1830 appear to have originated. And, thirdly, parish employment did not afford direct profit to any individual. Under the greatest part of the other systems of relief, the immediate employers of labour could throw on the parish a part of the wages of their labourers. They preferred, therefore, those modes of relief which they could turn to their own account, and out of which they could extract profit under the mask of charity.[1]

In some of the agricultural districts, the prevalent mismanagement in this respect had created in the minds of the paupers a notion that it was their right to be exempted from the same degree of labour as independent labourers. But in many places, whilst the labour required by the parish was trifling, the pay equalled or exceeded that of the independent labourer.[2]

The Labour-Rate System.—By an agreement amongst the rate-payers, that each of them should employ and pay out of his own money a certain number of the labourers who had settlements in the parish, in proportion, not to his real demand for labour, but according to his rental or to his contribution to the rates, or to the number of horses that he kept for tillage, or to the number of acres that he occupied, or according to some other scale.

II.—OUT-DOOR RELIEF OF THE IMPOTENT.

The out-door relief to the impotent, using that word as comprehending all except the able-bodied and their families, was subject to less abuse. The great source of poor-law mal-administration was the desire of many of those who regulated the distribution of the parochial funds, to extract from it a profit to themselves. The out-door relief to the able-bodied, and all relief which was administered in the workhouse, afforded ample opportunities for effecting this purpose; but no use could be made of the labour of the aged and sick, and there was little room for jobbing if their pensions were paid in money. Accordingly, it was found that even in places distinguished in general by the most wanton parochial profusion, the allowances to the aged and infirm were moderate.

General Remarks on Out-door Relief.

We have dwelt at some length on out-door relief, because it appears to be the relief which was most extensively given, and because it appears to have contained in itself the elements of an almost indefinite extension; of an extension, in short, which might ultimately have absorbed the whole fund out of which it arose. Amongst the elements of extension were the constantly diminishing reluctance to claim an apparent benefit, the receipt of which imposed no sacrifice, except a sensation of shame, quickly obliterated by habit, even if not prevented by example; the difficulty, often amounting to impossibility, on the part of those who administered and awarded relief, of ascertaining whether any and what necessity for it existed; and the existence in many cases of positive motives on their parts to grant it when unnecessary, or themselves to create the necessity.

From the evidence collected by the Commissioners, it will be seen how zealous must be the agency, and how intense the vigilance, to prevent fraudulent claims from crowding in under such a system of relief. But it would require still greater vigilance to prevent the *bona fide* claimants from degenerating into impostors; and it was an aphorism amongst the active parish-officers, that " cases which are good to-day are bad to-morrow, unless they are incessantly watched." A person obtained relief upon the ground of sickness; but when he became capable of returning to moderate work, he was tempted, by the enjoyment of subsistence without labour, to conceal his convalescence, and fraudulently extend the period of relief. When it really depended upon the receivers whether the relief should cease with its occasion, it was too much to expect of their virtue that they should, in any considerable number of instances, voluntarily forego the pension.

---

[1] "Either the work was completed by two or three o'clock, and the rest of the day spent in idleness, or the men consumed the whole day in the lazy performance of the work of a portion of the day."..."In Pollington, Yorkshire, they send many of them upon the highways, but they only work *four* hours per day. This is because there is not employment sufficient in that way; they sleep more than they work, and if any but the surveyor found them sleeping, they would laugh at them. In Rancliffe they employed a man in the winter of 1830-1831 to look over them; but they threatened *to drown* him, and he was obliged to withdraw."..."In the parish of Mancetter, in the county of Warwick, the overseer stated that young able men received two shillings and sixpence a week, and the magistrates would not allow the parish to employ them more than three days in the week, in order that they might get work for themselves. Upon inquiry, it appeared that their characters soon became so infamous, that no person would employ them, having devoted their spare time to thieving and poaching. In the township of Atherstone, Mr Wellday, a manufacturer, impatient of contributing his property to the encouragement of vice and idleness by paying men without exacting labour, purchased some water-carts himself, for the purpose of giving employment to paupers. The magistrates refused to allow them to be used after twelve o'clock in the day, in order that these men might procure work for themselves. They were also described as becoming the most worthless characters in the town." (Report, p. 37, 38.)

[2] Eastbourne, in Sussex, was a striking example. In that place, in which the average wages earned from individuals by hard work are twelve shillings a week, the parish pays for nominal labour as much as sixteen shillings a week. Two families alone received from it, in the year ended Lady-day 1832, L.92. 4s.; and the wives of the few independent labourers regret that their husbands are not paupers. (Ibid. p. 39.)

Another evil connected with out-door relief, and arising from its undefined character, was the natural tendency to award to the deserving more than was necessary, or, where more than necessary relief was afforded to all, to distinguish the deserving by extra allowances. The scale which we have already referred to, promulgated by the magistrates for the town of Cambridge, as well as several others, all directed the parish-officers to reward or encourage the deserving. The whole evidence showed the danger of such an attempt. It appeared that such endeavours to constitute the distributors of relief into a tribunal for the reward of merit, out of the property of others, had not only failed in effecting the benevolent intentions of their promoters, but had become sources of fraud on the part of the distributors, and of discontent and violence on the part of the claimants.

A common consequence was, that to satisfy the clamours of the undeserving, the general scale of relief was raised; but the ultimate result of such a proceeding appears always to have been to augment the distress which it was intended to mitigate, and to render still more fierce the discontent which it was intended to appease. Profuse allowances excited the most extravagant expectations on the part of the claimants, who conceived that an inexhaustible fund was devoted to their use, and that they were wronged to the extent of whatever fell short of their claims. Such relief partook of the nature of indiscriminate alms-giving in its effects, as a bounty on indolence and vice; but the apparently legal sanction to this parochial alms-giving rendered the discontent on denial the most intense. Wherever, indeed, public charities are profusely administered, we hear, from those who are engaged in their administration, complaints of the discontent and disorders introduced.

It appeared from all the Commissioners' returns, that in every district the discontent of the labouring classes was proportioned to the money disbursed in poor-rates or in voluntary charities. The able-bodied unmarried labourers were discontented, from being put to a disadvantage as compared with the married. The paupers were discontented, from their expectations being raised by the ordinary administration of the system, beyond any means of satisfying them.[1]

Those who worked, though receiving good wages, being denominated *poor*, and classed with the really indigent, thought themselves entitled to a share of the " poor funds." Whatever addition was made to allowances under these circumstances excited the expectation of still further allowances, increased the conception of the extent of the right, and insured proportionate disappointment and hatred if that expectation were not satisfied. On the other hand, wherever the objects of expectation had been made definite, where wages, upon the performance of work, had been substituted for eleemosynary aid, and those wages had been allowed to remain matter of contract, employment had again produced content, and kindness became once more a cause of gratitude.

III.—IN-DOORS RELIEF.

In-doors relief, that which was given within the walls of the poor-house, or, as it was usually, but very seldom properly, denominated, the workhouse, was also subject to great mal-administration. But in by far the greater number of cases it was a large alms-house, in which the young were trained in idleness, and ignorance, and vice; the able-bodied maintained in sluggish and sensual indolence; the aged and more respectable exposed to all the misery incident to dwelling in such a society, without government or classification; and the whole body of inmates subsisting on food far exceeding, both in kind and in amount, not merely the diet of the independent labourer, but that of the majority of the persons who contributed to their support.

Progress of pauperism.

The progress of pauperism, as far as it can be inferred from the progress of expenditure, had been such under the unamended law during the present century as is exhibited in the following table;[2] to which the prices of wheat, and the quantities which might have been purchased by the total sums expended, are added, to check somewhat the misapprehension which might otherwise arise as to the true value of the sums expended through the fluctuating values of money during the interval to which the table extends.

Years.	Sums expended for Relief of the Poor.	Population o England and Wales.*	Average Price of Wheat per Quarter.		Number of Quarters of Wheat for which the money could have been exchanged.
	L.		s.	d.	
1801	4,017,871	8,872,980	115	11	693,234
1803	4,077,891	9,148,314	57	1	1,428,751
1811	6,656,105	10,163,676	92	5	1,440,455
1814	6,294,581	10,755,034	72	1	1,746,474

1817	6,910,925	11,349,750	94	0	1,470,409
1818	7,870,801	11,524,389	83	8	1,881,466
1819	7,516,704	11,700,965	72	3	2,080,748
1820	7,330,256	11,893,155	65	10	2,226,913
1821	6,959,249	11,978,875	54	5	2,557,763
1822	6,358,702	12,313,810	43	3	2,940,440
1823	5,772,958	12,508,956	51	9	2,231,094
1824	5,736,898	12,699,098	62	0	1,850,612
1825	5,786,989	12,881,906	66	6	1,740,447
1826	5,928,501	13,056,931	56	11	2,083,221
1827	6,441,088	13,242,019	56	9	2,269,987
1828	6,298,000	13,441,913	60	5	2,084,855
1829	6,332,410	13,620,701	66	3	1,911,671
1830	6,829,042	13,811,467	64	3	2,125,772
1831	6,798,888	13,897,187	66	4	2,049,916
1832	7,036,968	14,105,645	58	8	2,398,966
1833	6,790,799	14,317,229	52	11	2,566,601

* The numbers given in this column for the years 1801, 1811, 1821, and 1831, are those ascertained at the enumeration of those years; those stated for the intermediate and for subsequent years are computed from the baptisms and burials, and from the rate of increase, as ascertained at each census.

---

[1] " They, as well as the independent labourers, to whom the term poor is equally applied, are instructed," says Mr Chadwick, " that they have a right to ' a *reasonable* subsistence,' or ' a *fair* subsistence,' or ' an *adequate* subsistence.' When I have asked of the rate-distributors what '*fair*,' or '*reasonable*,' or '*adequate*' meant, I have in every instance been answered differently; some stating they thought it meant such as would give a good allowance of ' meat every day,' which no poor man (meaning a pauper) should be without; although a large proportion of the rate-payers do go without it." It is abundantly shown in the course of this inquiry, that where the terms used by the public authorities are vague, they are always filled up by the desires of the claimants, and the desires always wait on the imagination, which is the worst regulated and the most vivid in the most ignorant of the people. In Newbury and Reading, the money dispensed in poor-rates and charity is as great as could be desired by the warmest advocate either of compulsory or of voluntary relief; and yet, during the agricultural riots, many of the inhabitants in both towns were under strong apprehensions of the rising of the very people amongst whom the poor-rates and charities are so profusely distributed. The violence of most of the mobs seems to have arisen from an idea that all their privations arose from the cupidity or fraud of those intrusted with the management of the fund provided for the poor. (Report, p. 50.)

[2] For the like information, collected for the years subsequent to 1833, during which the amended law has been in operation, see the table at page 315.

The following represents the results of the above table at the periods of the decennial census.

Years of the Census.	Cost per head on total Population. s.	d.
1801	9	1
1811	13	1
1821	10	7
1831	9	9

The foregoing table, however, can by no means be adopted as indicating with any accuracy the real progress of the evil. In the first place, the progress in the amount expended only indicates an increased proportion of pauperism, inasmuch as the increase in the sums expended exceeds the increase in the population. Thus, from the year 1803 to the year 1823, the population increased from nine to twelve millions, whilst the sums expended for relief of the poor increased from four to five and three-fourth millions. This indicates but a small increase in pauperism relatively to the increase of population, and the number of paupers in every hundred persons might have been nearly the same at the two periods compared. We find, however, that the increase in the value of the money expended, as reckoned in the wheat purchaseable by it, was as fourteen to twenty-two, that is, an increase in pauperism which would have exceeded the progress of the population in the proportion of twenty per cent.; and in this period it is to be supposed, either that the numbers of paupers may have increased in the proportion of twenty per cent., or that the effective relief, that is, the quantity of commodities given on the one side and received on the other, had at least increased in the proportion of twenty per cent. But, during all this period, other necessaries and commodities of life had diminished in price in a still greater proportion. Thus it was calculated by Mr Porter,[1] from the extensive data contained in his tables, that the sum of nine shillings and ninepence, the amount of relief per head, in the year 1831, would have purchased as much as seventeen shillings would have bought in 1801.

The sums returned as expended in poor-rates, though, since 1834 and at present, they represent the whole amount of the burthen, did, in fact, up to the year 1834, include but a small part of the whole charge. Of the various modes in which relief was given to the able-bodied labourer, or rather extorted from a portion of the parishioners, two of those above described, viz. relief on the roundsman system, and that on the labour-rate system, were means of casting the burthen of a man's support upon a parishioner, without the levying or expending of any rate. No means exist to enable us to calculate the amount of the burthen thus incurred by the occupiers; and of course the means of calculating the sacrifices of landlords, who made deductions of rate in regard of these charges, are equally wanting. We however find, that amongst the most conspicuous instances in which the rents of a parish had been nearly or entirely absorbed in the relief afforded by these two systems, very small rates had been levied upon the occupiers in money. The Commissioners' evidence, particularly their Appendix (D), is full of instances of this source of indirect and unrecorded loss.[2]

It must also be borne in mind, that in proportion as these modes of relief to the able-bodied were extended, and as the real amount of the burthen was thus concealed, the deterioration of the labourer's habits of industry, involving, not a loss of the particular year, but a permanent destruction of his utility as a labourer, as well as of his prudence and morality, were proceeding in a ratio even more rapid than the progress of these insidious forms of relief.

Objections to amendment,

It might have been hoped, that, under such circumstances, a general feeling would have arisen that these abuses were intolerable, and must be put an end to at any risk or at any sacrifice. But many who acknowledged the evil seemed to expect the cure of an inveterate disease without exposing the patient to any suffering, or even discomfort. They exclaimed against the burthen as intolerable, but objected to any amendment, if it appeared that it must be, or might be, attended with any inconvenience. And amongst all parties, labourers, employers of labourers, and owners of property, many were to be found who thought that they would suffer some immediate injury from any change which should tend to throw the labouring classes on their own resources.

1. On the part of labourers;

The labourer felt that the existing system, though it generally gave him low wages, always gave him easy work. It gave him likewise, strange as it may appear, what he valued more, a sort of independence. He needed not bestir himself to seek work, he needed not study to please his master, he needed not put any restraint upon his temper, he needed not ask relief as a favour. He had all a slave's security for subsistence, without his liability to punishment. As a single man, indeed, his income did not exceed a bare subsistence; but he had only to marry, and it increased. Even then it was unequal to the support of a family, but it rose on the birth of every child. If his family were numerous, the parish became his principal paymaster; for, small as the usual allowance of two shillings a-head might be, yet, when there were more than three children, it generally exceeded the average wages given in a pauperised district. A man with a wife and six children, entitled, according to the scale, to have his wages made up to sixteen shillings a week, in a parish where the usual wages paid by individuals did not exceed ten shillings or twelve shillings, was almost an irresponsible being. All other classes of society were exposed to the vicissitudes of hope and fear; he alone had nothing to lose or gain.[1]

---

[1] See the Progress of the Nation, by G. R. Porter, Esq. small 8vo, 1836, p. 83.

[2] Mr Cowell's Report contains the examination of a large farmer and proprietor at Great Shelford, who, on 500 acres, situated in that parish, pays ten shillings per acre poor-rate, or L.250 a year. In addition, though he requires for his farm only sixteen regular labourers, he constantly employs twenty or twenty-one. The wages of these supernumerary labourers amount to L.150 a year, and he calculates the value of what they produce at L.50 a year; so that his real contribution to the relief of the poor is not L.250, the sum which would appear in the parliamentary returns, but L.350. In the same Report is to be found a letter from Mr Wedd of Royston, containing the following passages:—

"An occupier of land near this place told me to-day that he pays L.100 for poor-rates, and is compelled to employ fourteen men and six boys, and requires the labour of only ten men and three boys. His extra labour at ten shillings a week, which is the current rate for men, and half as much for boys, is L.130."

"Another occupier stated yesterday that he held 165 acres of land, of which half was pasture. He was compelled to employ twelve men and boys, and his farm required the labour of only five. He is about to give notice that he will quit. Every useless labourer is calculated to add five shillings an acre to the rent of a farm of 100 acres."

It contains also a letter from Mr Nash of Royston, the occupier of a farm in a neighbouring parish, stating that "The overseer, on the plea that he could no longer collect the money for the poor-rates without resorting to coercive measures, and that the unemployed poor must be apportioned amongst the occupiers of land in proportion to their respective quantities, had required him to take two more men. Mr Nash was consequently obliged to displace two excellent labourers, and of the two men sent in their stead one was a married man with a family sickly, and not much inclined to work; the other a single man addicted to drinking."

The subsequent history of these two men appears in Mr Power's Report. One killed a favourite blood mare of Mr Nash's, and the other he was obliged to prosecute for stealing his corn. (Report, p. 55.)

It appeared to the pauper, that the government had undertaken to repeal, in his favour, the ordinary laws of nature; to enact that the children should not suffer for the misconduct of their parents, the wife for that of the husband, or the husband for that of the wife; that no one should lose the means of comfortable subsistence, whatever might be his indolence, prodigality, or vice; in short, that the penalty which, after all, must be paid by some one for idleness and improvidence, should fall, not on the guilty person, or on his family, but on the proprietors of the lands and houses encumbered by his settlement. Can we wonder if the uneducated were seduced into approving a system which aimed its allurements at all the weakest parts of our nature, which offered marriage to the young, security to the anxious, ease to the lazy, and impunity to the profligate?

2. On the part of employers;

The employers of paupers were attached to a system which enabled them to dismiss and resume their labourers according to their daily or even hourly want of them, to reduce wages to the minimum of what would support an unmarried man, and to throw upon others the payment of a part, frequently of the greater part, and sometimes almost the whole, of the wages actually received by their labourers. And even if they paid in rates what they would otherwise pay in wages, they preferred the payment of rates, which occurred at intervals, and the payment of which might from time to time be put off, to the weekly ready-money expenditure of wages. High rates, too, were a ground for demanding an abatement from rent; but high wages were not.[2]

3. On the part of proprietors.

The owners of rateable property might, at least, have been expected to be favourable to any change which should avert their impending ruin. But of the property liable to poor-rates, there is a portion, and a portion of considerable importance, less from its value, than from the number of rate-payers amongst whom it is divided, and their influence in vestries, which not only is, in practice, exempted from contributing to the parochial fund, but derives its principal value from the mal-administration of that fund. This property consists of cottages or apartments inhabited by the poor. In almost all places the dwellings of the poor, or at least of the settled poor, were exempted from rates, and, besides, the rent was, in a very large proportion, paid by the parish. The former practice enabled the proprietor often to increase the rent by the amount of rate remitted, and always to be an owner of real property, and yet escape the principal burdens to which such property was subjected. The latter practice gave him a solvent tenant, and, if he had influence with the vestry or with the overseer, a liberal one.

Of the higher classes of landlords, those who reside in towns seldom took much part in parochial government, or had any distinct ideas as to the extent or the effects of its mismanagement; and the majority of those who had become familiarized with the abuses of the villages seem to have acquired habits of thinking and feeling and acting which unfitted them to originate any real and extensive amendment, or even to understand the principles upon which it ought to be based. To suppose that the poor are the proper managers of their own concerns; that a man's wages ought to depend on his services, not on his wants; that the earnings of an ordinary labourer are naturally equal to the support of an ordinary family; that the welfare of that family naturally depends on his conduct; that he is bound to exercise any sort of prudence or economy; that anything is to be hoped from voluntary charity; are views which many of those who had long resided in pauperised rural districts seem to have rejected as too absurd for formal refutation.

---

[1] Even in Barnard Castle, in Durham, Mr Wilson states, that if any remonstrance is made on account of the applicant's bad character, the reply of the magistrate commonly is, "the children must not suffer for it."

The following answers are specimens of the feeling and conduct in the southern districts:—"The answer given by the magistrates, when a man's bad conduct is urged by the overseer against his relief, is, 'We cannot help that; his wife and family are not to suffer because the man has done wrong.'"

"Too frequently petty thieving, drunkenness, or impertinence to a master, throw able-bodied labourers, perhaps with large families, on the parish funds, when relief is demanded as a right, and, if refused, enforced by a magistrate's order, without reference to the cause which has produced his distress, viz. his own misconduct, which remains as a barrier to his obtaining any fresh situation, and leaves him a dead weight upon the honesty and industry of his parish."

Mr Stuart states, that in Suffolk, children deserted by their parents are in general well taken care of, and that the crime of deserting them is largely encouraged by the certainty that the parish must support the family. Even the inconvenience which might fall on the husband by the punishment of his wife for theft, is made the subject of pecuniary compensation at the expense of the injured parish. Under what other system could there be a judicial instrument concluding thus:—

"And whereas it appears to us that the wife of the said Robert Reed is now confined in the house of correction at Cambridge, and that he is put to considerable expense in providing a person to look after his said five children, we do therefore *order* the churchwardens and overseers of the poor of the said parish, or such of them to whom these presents shall come, to pay unto the said Robert Reed the sum of eleven shillings weekly and every week, for and towards the support and maintenance of himself and family, for one month from the day of the date hereof. Given under our hands and seals this twentieth day of February, in the year of our Lord one thousand eight hundred and thirty-three." (Report, p. 59.)

[2] In Mr Richardson's instructive statement of the reforms effected by Mr Litchfield, in Farthingoe, Northamptonshire, we find that Mr Litchfield has been opposed, not only by the labourers, but by the farmers; first, because they grudged giving the labourer with no children eight shillings a week; secondly, because they were afraid to displease the labourer who had two children, and preferred head-money; and, thirdly, because they were fearful lest, if the rates were lowered, their rents would be raised; and that they encouraged the labourers, at first openly, and afterwards covertly, in their attempts to deter Mr Litchfield by menaces and insult.

"When a valuer," says Mr Cowell, "values a farm to an in-coming tenant, or fixes the rent from time to time (in these parts they have no leases), he says, 'What are your poor-rates?' If the tenant answer, 'Rates are low, but wages are high,' the valuer says, 'I have nothing to do with *wages*, that is your affair; but *rates* are a *positive thing*, and I allow for *them*.' This Mr Ellman considers as a bad custom, as it holds out an inducement to the farmer to prefer low wages and high rates. Tenants at will, says Mr Cogshill, too often think, the more poor-rates the less rent. Confidence between landlord and tenant seems quite lost. I have witnessed a good deal of this."

The following replies to question 36 of the Commissioners' Rural Queries are further testimonies to the same effect.

"I think the poor-laws have not diminished the capital, but rather the rent of the landlord, as the tenant considers rents and rates as payment for the farm, and one can only be increased at the expense of the other."

"The farmers are aware that, excepting in cases of long tenures and very sudden augmentation of rates, the burden does not at all affect them. It is a rent paid to the parish instead of the landowner."

"It should be understood that poor-rates are deducted in all calculations for rent; and that landlords pay them, and not the farmers."

"Capital is decreasing, from the loose manner in which the laws are administered, and the tenants feeling that they do not in effect pay the rates, but the landlord. I cannot otherwise account for the apathy with which they view, and the tenacity with which, in many instances, they defend abuses." (Report, pp. 60, 61, 62.)

Effects of System.

Effects of system on proprietors,

Yet were the effects of the system such, that it might reasonably have been expected that any plan affording a reasonable prospect of a remedy would have been welcomed by all classes. The proprietors, who had been mulcted every year of a larger and larger portion of their income, were not only deprived of the benefits to their property naturally dependent on a constant increase of the population and in the consumption of produce, each such increase bringing with it an accumulating charge of pauperism. Instances of the total abandonment of the land had not yet become numerous, but the approach towards it was in many cases imminent, and in all certain and rapid;[1] whilst every diminution of cultivation was seen to have a double effect in increasing the rate on the remaining cultivation, the number of unemployed labourers being increased at the same instant as the fund for payment of rates was diminished; and the abandonment of property once begun caused the deterioration in the rest to proceed at an accelerated ratio.

on employers,

The employers found the services of their labourers deteriorated by the loss of industry, skill, and intelligence, which can only be secured by a recognition, on the part of the labourer, of the value to himself of such qualities; and they had to contend with many other habits of insolence and insubordination, the natural results of the labourer's ceasing to depend upon his good character.

on the labourers.

But by far the severest sufferers were those for whose benefit the system was supposed to have been introduced and perpetuated,—the labourers and their families. Amongst these the effects were not confined to those who were actually relieved. Instances were everywhere found in which the prudence and forethought of a labourer became his punishment instead of a reward. So onerous was the entire support of a man with a large family, and entirely destitute, that the rate-payers in agricultural parishes were generally agreed in employing such a one, so as to keep his family off the rates, in preference to another who had not married, or who had no family, or who had the means, by greater prudence or by any good fortune, for a while to support himself.[2] The system, in short, was this.

Piece-work was refused to the single man, or to the married man, if he had any property, because they could exist upon day-wages; it was refused to the active and intelligent labourer, because he could earn too much. The enterprising man, who had fled from the tyranny and pauperism of his parish to some place where there was a demand and a reward for his services, was driven from a situation which suited him, and an employer to whom he was attached, by a labour-rate or some other device against non-parishioners, and forced back to his settlement to receive as alms a portion only of what he was before obtaining by his own exertions. He was driven from a place where he was earning, as a free labourer, twelve or fourteen shillings a week, and was offered road-work as a pauper at sixpence a day, or perhaps he was put up by the parish authorities to auction, and sold to the farmer who would take him at the lowest allowance.

Effects of System.

Can we wonder, then, if the labourer abandoned virtues of which this was the reward; if he gave up the economy in return for which he had been proscribed, the diligence for which he had been condemned to involuntary idleness, and the prudence, if it can be called such, which diminished his means just as much as it diminished his wants? Can we wonder if, smarting under these oppressions, he considered the law, and all who administered the law, as his enemies, the fair objects of his fraud or his violence? Can we wonder if, to increase his income, and to revenge himself on the parish, he married, and thus helped to increase that local excess of population which was gradually eating away the fund out of which he and all the other labourers of the parish were to be maintained?

But though the injustice perpetrated upon the man who struggled, as far as he could struggle, against the oppression of the system, who refused, as far as he could refuse, to be its accomplice, was at first sight the most revolting, the severest sufferers were those that had become callous to their own degradation, who valued parish support as their privilege, and demanded it as their right, and complained only that it was limited in amount, or that some sort of labour or confinement was exacted in return. No man's principles can be corrupted without injury to society in general; but the person most injured is the person whose principles have been corrupted. The constant war which the pauper had to wage with all who employed or paid him, was destructive of his honesty and his temper; as his subsistence did not depend on his exertions, he lost all that sweetens labour, its association with reward, and got through his work, such as it was, with the reluctance of a slave. His pay, earned by importunity or fraud, or even violence, was not husbanded with the carefulness which would be given to the results of industry, but wasted in the intemperance to which his ample leisure invited him. The ground upon which relief was ordered to the idle and dissolute was, that the wife and children must not suffer for the vices of the head of the family; but as that relief was almost always given into the hands of the vicious husband or parent, this excuse was obviously absurd. It appears from the evidence that the great supporters of the beer-shops were the paupers.

---

[1] See the Commissioners' Report, page 65, where instances like the following are given from all parts of the country. The present is taken from Leicestershire, a county not within the range of the extreme operation of pauperism. "Mr Pilkington's description of several places in Leicestershire is equally alarming. In Hinckley he found the poor-rate exceeding one pound an acre, and rapidly increasing, and a general opinion that the day is not distant when rent must cease altogether. On visiting Wigston Magna. in November 1832, he was informed that the value of property had fallen one half since 1820, and was not saleable even at that reduction. It does not appear, indeed, that it ought to have sold for more than two or three years' purchase, the net rental not amounting to L.4000 a year, and the poor-rate expenditure growing at the rate of L.1000 increase in a single year. And on his return to that neighbourhood, three months afterwards, the statement made to him was, that property in land was gone; that even the rates could not be collected without regular summons and judicial sales; and that the present system must insure, and very shortly, the total ruin of every individual of any property in the parish. We cannot wonder, after this, at the statement of an eminent solicitor at Loughborough, that it is now scarcely possible to effect a sale of property in that neighbourhood at any price."

The following answers, taken from a multitude of others of a similar nature, contained in Appendix (B), are to the same effect:—

"Annual value of the real property, as assessed April 1815, L.3390; annual value of the real property, as assessed November 1829, L.1959. 5s. It has undoubtedly fallen in value since the last valuation, *i. e.* in the last two years; and the population has been more than trebled in thirty years—1801, 306; 1811, 707; 1821, 897; 1831, 938; and that in spite of an emigration of considerable amount, at the parish expense, in 1829. The eighteen-penny children will eat up this parish in ten years more, unless some relief be afforded us." (Report, pp. 65, 66.)

[2] See striking evidences of these influences in the Report, page 78. "Will it be believed that such is not merely the cruelty, but the folly, of the rate-payers in many places, that they prohibit this conduct (the anxiety of an independent labourer to make provisions for his family by his own exertions)—that they conspire to deny the man who, in defiance of the examples of all around him, has dared to save, and attempts to keep his savings, the permission to work for his bread? Such a statement appears so monstrous, that we will substantiate it by some extracts from our evidence."

Sir Harry Verney, in a communication which will be found in Appendix (C), says, "In the hundred of Buckingham, in which I act as a magistrate, many instances occur where labourers are unable to obtain employment, because they have property of their own. For instance, in the parish of Steeple Claydon, John Lines, formerly a soldier, a very good workman, is refused employment because he receives a pension. The farmers say that they cannot afford to employ those for whom they are not bound by law to provide."

The worst of results, however, are still to be mentioned. In all ranks of society, the great sources of happiness and virtue were the domestic affections, and this was particularly the case amongst those who had so few resources as the labouring classes. Now pauperism seems to have become an engine for the purpose of disconnecting each member of a family from all the others, and of reducing all to the state of domesticated animals, fed, lodged, and provided for by the parish, without mutual dependence or mutual interest.[1]

CHAPTER IV.

REMEDIAL MEASURES PROPOSED AND ADOPTED.

The manifest progress from year to year of all these evils; their consummation in many places, and the impending danger of the like consummation in all others; above all, the rural outrages, riots, and incendiarism which prevailed to a most alarming extent from the years 1828 to 1832, more especially in those districts where pauperism most prevailed, and the failure of all previous inquiries by parliamentary committees to devise any effectual remedy whatsoever for even the least of the mischiefs, led to the experiment of a royal commission of inquiry, appointed in 1832, which brought its investigations to a conclusion in 1834 in the form of a very valuable report, presented to both Houses of Parliament early in that year, and in the preparation of the bill which became law, and is the basis of all subsequent legislation, the Poor-Law Amendment Act (4 and 5 Will. IV., c. 76).

The following description will exhibit a mere summary of the remedies proposed and adopted, with little more than hints of the reasonings upon which they were founded.

The Commissioners by no means adopted the opinion that a poor-law could, in a community like ours, be dispensed with. They found that the most pressing of the evils of the poor-laws were those connected with the relief of the able-bodied, and for these they suggested their first remedies. They assumed as their principle of administration, that the public is warranted in imposing such conditions on the individual relieved, as are conducive to the benefit either of the individual himself, or of the country at large at whose expense he is relieved.

Principle of administering relief.

They proposed, then, as the first and most essential of all conditions of relief, that the situation of the pauper, upon the whole, should not be made really or apparently so eligible as the situation of the independent labourer of the lowest class. It was shown throughout the evidence, that as the condition of the pauper class was elevated, the condition of the independent class was depressed, their industry impaired, their employment rendered unsteady, and its remuneration diminished. Such persons, therefore, were under the strongest inducements to quit the *less eligible class of labourers*, and enter the *more eligible class of paupers.* The Commissioners maintained that the converse would be, and was found to be, the effect of placing the pauper class in its proper position below the condition of the independent labourer. They found, on a large examination of the cases of strict administration of relief on the principle of letting the labourer find in the parish the hardest taskmaster and the worst paymaster he can have, that the parish had always become his last, and not his first, resource; and they found largely exemplified those specific results which invariably ensue from such an administration.

Effects of this.

The first and immediate effect, was the conversion of the able-bodied paupers into independent labourers. The second result, indeed a corollary of the first, was the reduction of the parochial expenditure, constituting an increase of the fund for the employment of independent labourers. The third effect, closely connected with and following the absorption of able-bodied paupers, and their conversion into independent labourers, was the rise in wages. The fourth class of the observed specific effects was the diminution, not only of pauper-marriages, but of those imprudent marriages contracted with the knowledge and confidence that the worst result to be apprehended was an eventual dependence upon the poor-rate. The fifth and last specific effect dwelt upon by the Commissioners, and illustrated by their evidence, was the diminution of crime, and the contentment of the labourers increasing with their industry.

The Commissioners, in endeavouring to obtain the general adoption of this principle, cautiously avoided the recommendation of speculative remedies; they dwelt anxiously and emphatically upon the necessity and the safety of adopting a course of legislation which may be considered as wholly experimental. They propose, therefore, no changes in the principle of the law, but confine their recommendations to this, that the means which have been found the most effective in practice, should be applied wherever it was found applicable with the prospect of a beneficial result.

To secure this operation, they recommend the adoption of a new and more responsible agency to co-operate with and control that which had been found for the most part inefficient, or greatly efficient for mischief. Some excrescences in the law they proposed to lop off, but no additions beyond the improvement of the agency were proposed to be introduced in the principle of the statute of Elizabeth, and the succeeding legislation. They recommend, therefore, "that those modes of administering relief which have been tried and found beneficial, be generally enforced" (Report, p. 261); and "that the practice of giving relief in well-regulated workhouses, and the abolition of partial relief to the able-bodied, having been tried and found beneficial, be extended to all places." (*Ibid.* p. 262.)

---

[1] "The effect of allowance," says Mr Stuart, "is to weaken, if not to destroy, all the ties of affection between parent and child. Whenever a lad comes to earn wages, or to receive parish relief on his own account" (and this we must recollect is at the age of fourteen), "although he may continue to lodge with his parents, he does not throw his money into a common purse, and board with them, but buys his own loaf and piece of bacon, which he devours alone. The most disgraceful quarrels arise from mutual accusations of theft; and as the child knows that he has been nurtured at the expense of the parish, he has no filial attachment to his parents. The circumstances of the pauper stand in an inverted relation to those of every other rank in society. Instead of a family being a source of care, anxiety, and expense, for which he hopes to be rewarded by the filial return of assistance and support when they grow up, there is no period in his life in which he tastes less of solicitude, or in which he has the means of obtaining all the necessaries of life in greater abundance; but as he is always sure of maintenance, it is in general the practice to enjoy life when he can, and no thought is taken for the morrow. Those parents who are thoroughly degraded and demoralized by the effects of 'allowance,' not only take no means to train up their children to habits of industry, but do their utmost to prevent their obtaining employment, lest it should come to the knowledge of the parish-officers, and be laid hold of for the purpose of taking away the allowance."

"At Princes Risborough, we turned over the minute-book of the Select Vestry, and found the following entries:

"'Samuel Simmons's wife applied to be allowed something for looking after her mother, who is confined to her bed; the mother now receives 3s. 6d. weekly. To be allowed an additional 6d. for a few weeks.'

"'David Walker's wife applied to be allowed something for looking after her father and mother (old Stevens and his wife), now ill, who receive 6s. weekly. To be allowed 1s. weekly.'

"'Mary Lacy applies for something for waiting on her mother, now ill. Left to the governor.'

"'Elizabeth Prime applies to have something allowed for her sister looking after her father, now ill. Left to the governor.'" (Report, pp. 96, 97.)

Workhouse recommendations.

The first and chief specific measure recommended by them was thus described:—" *First*, That, except as to medical attendance, and subject to the exception respecting apprenticeship hereinafter stated, all relief whatever to able-bodied persons, or to their families, otherwise than in well-regulated workhouses (*i. e.* places where they may be set to work according to the spirit and intention of the 43d of Elizabeth), shall be declared unlawful, and shall cease, in manner and at periods hereafter specified; and that all relief afforded in respect of children under the age of sixteen shall be considered as afforded to their parents." (*Ibid.* p. 262.)

This adoption of the workhouse and its restrictions as the condition upon which relief was to be administered, was advised, because it would operate, in the first place, as a self-acting test of the claim of the applicant, it being urged "That it is demoralizing and ruinous to offer to the able-bodied of the best characters more than a simple subsistence. The person of bad character, if he be allowed anything, could not be allowed less. By the means which we propose, the line between those who do, and those who do not, need relief, is drawn, and drawn perfectly. If the claimant does not comply with the terms on which relief is given to the destitute, he gets nothing; and if he does comply, the compliance proves the truth of the claim, namely, his destitution. If, then, regulations were established and enforced with the degree of strictness that has been attained in the dispauperised parishes, the workhouse doors might be thrown open to all who would enter them, and conform to the regulations. Not only would no agency for contending against fraudulent rapacity and perjury, no stages of appeals (vexatious to the appellants and painful to the magistrates), be requisite to keep the able-bodied from the parish; but the intentions of the statute of Elizabeth, in setting the idle to work, might be accomplished, and vagrants and mendicants actually forced on the parish, that is, forced into a condition of salutary restriction and labour. It would be found that they might be supported much cheaper under proper regulations than when living at large by mendicity or depredation." (*Ibid.* p. 264.)

In the *second* place, it was observed by the Commissioners, that "Little need be said on the next effect of the abolition of partial relief (even independently of workhouse regulations), in drawing a broad line of distinction between the paupers and the independent labourers. Experience has shown, that it will induce many of those whose wants arise from their idleness, to earn the means of subsistence; repress the fraudulent claims of those who have now adequate means of independent support; and obtain for others assistance from their friends, who are willing to see their relations pensioners, but would exert themselves to prevent their being inmates of a workhouse." (*Ibid.* p. 276.)

In the *third* place, it was relied on to remove much of the evil arising from the situation of the distributors of relief, who, having many modes of relief at their disposal, were rendered liable to odium and revenge when they chose a more strict mode of administration, and were liable to be seduced by all the motives which the love of popularity, fear, or the cajolery, importunity, or menaces of the applicant presented, to adopt a lax administration.

ow far dopted.

These reasons appear to have entirely prevailed with the legislature, who accordingly adopted them in principle, only modifying them thus far in their form. Combining the effect of this recommendation with the one subsequently to be described, the institution of a central board, the legislature—not fixing any determinate period, but bearing in mind the magnitude of the amount of the existing out-door relief to able-bodied men and their families, with the possibility that the means might not suffice at the periods to be specified, for affording all the workhouse relief that might be required upon a sudden cessation of all other relief—adopted the plan of leaving the determination of the period at which out-door relief should cease, and relief in the workhouse become the invariable rule, to the judgment of the central board; that board having power to adopt a different course in different districts, to adopt the workhouse relief entirely and at once where the means existed, and in others to prepare the way by procuring workhouses, and the gradual substitution of relief in kind for relief in money, and by other intermediate and preparatory operations. (See the Act, sect. 52.) As a consequence of adopting this course, all restrictions imposed by previous acts upon officers, with a view of preventing them from applying the workhouse to able-bodied men, are repealed (sect. 53); and authority to direct the purchase, the furnishing, and the management of workhouses is given to the central board.

Parents' liability.

The legislature adopted, without change, except by way of addition, so much of this recommendation as has the effect of identifying the relief to an unemancipated child with the relief to the parent; the intended effect being to render the parent as responsible for providing for his children as for himself, and subject to the same consequences of neglect in either case, so that he cannot seek relief for his child, without submitting to the condition upon which alone he could obtain it for himself, or otherwise. The legislature adopted with this recommendation these expansions and additions: Relief of the wife is made relief to the husband; of the child, to the parent, to the father if living, or otherwise to the widow (sect. 56); and of the bastard child, to the mother (sect. 71). Moreover, a man marrying since the act, is made liable to maintain the children which his wife has at the time of her marriage, until they attain the age of sixteen, or until her death (sect. 57); this last provision being made with the view that the man is liable to all the civil obligations of his wife existing at the time of her marriage, excepting this obligation, which must commonly have been of all her obligations the most notorious. As the law stood, a woman's family, legitimate or illegitimate, was, by her marriage, cast on the parish for support, and the allowances made to them constituted an annuity to the married couple, forming an inducement of extraordinary frequency to marriages in all other respects the most improvident.

Central control.

The Commissioners' second specific measure was thus proposed:—" We recommend, therefore, the appointment of a central board to control the administration of the poor-laws, with such assistant commissioners as may be found requisite; and that the commissioners be empowered and directed to frame and enforce regulations for the government of workhouses, and as to the nature and amount of the relief to be given and the labour to be exacted in them; and that such regulations shall, as far as may be practicable, be uniform throughout the country." (Report, p. 296.)

The reasons for the establishment of this agency are eloquently and instructively stated in the Report; especially the reasons for relying rather upon a constantly-acting agency, with the means of judging at every moment of the extent to which its measures would then apply, in preference to relying upon a mere legislative enactment, however valuable the principle involved, or stringent its provisions might be. Instances of a striking kind are given, not only of the failure of such enactments, but of their conversion to purposes directly contrary to their object, where no authority was erected responsible for conducting their operations. The other grounds for this recommendation were chiefly the impossibility of choosing a succession of overseers or other annual officers with ap-

Remedial Measures.

Remedial Measures.

propriate knowledge, still less with the enlarged experience of the means to be used, or an enlightened appreciation of the objects to be attained; next, the short duration of the office, which, even where able officers are occasionally found, prevents the continued application of their experience, precisely at the time when their efficiency has become the greatest; next, the division of the districts for which they served, preventing co-operation or the dispersion of the knowledge obtained on one spot over the others to which it might be applicable. Scarcely an instance was found of a parish being dispauperised, the example of which was followed even by a single adjoining parish. Reference was also made to the inadequacy of the motives of any officer to support a sound administration: his responsibility little or none,—his gain no more than that of every other rate-payer occupying as largely as himself,—the loss of time and of energy,—the danger of misapprehension by those he sought to serve, and of failure in the whole object, great,—the certainty of odium from the pauper and from the prejudiced amongst his fellow-parishioners, and of jealousy from rival officers, being inevitable,—on the other hand, the strength of the interests in abusive administration, by which one man may make to himself a gain of the losses of many, whilst by the best administration he can only save himself from the loss falling to the share of one,—the confederacy of those who recognise their interest in such corrupt gain,—the popularity to be acquired by liberality in the disposal of funds contributed by others,—form some few of the motives to uphold abusive administration. In these views the Commissioners adopted the conclusion, that whatever might be the intentions of the legislature, they would be best carried out by a permanent authority, accumulating experience in itself, independent of local control, uninterested in favour of local abuse, but responsible for carrying into effect the law which it was appointed to execute. This recommendation was adopted by the legislature, according to the spirit in which it was made. A board of three commissioners was to be appointed by the king (sects. 1 to 11), themselves appointing assistant commissioners, capable of receiving the powers of the commission by delegation (sects. 8 to 13); the commission having power to direct and control the whole administration of relief throughout England and Wales, and especially the government of workhouses, and it being left to them to determine the extent to which the measures to be carried out should be rendered uniform.

Union of parishes. But the districts for the administration of relief, that is, parishes by the statute of Elizabeth, and town-lands by the 13th and 14th Charles II., had been fortuitously created, sometimes containing but one householder, sometimes containing a population exceeding 100,000. There were in 1831, in England and Wales, fifty-six parishes containing less than ten persons, and which may be therefore calculated, one with the other, to contain but two adult males; a hundred and forty-eight parishes containing but from ten to twenty persons, the largest of these on the average containing five adult males; and five hundred and thirty-three parishes containing from twenty to fifty persons, the largest of which would give less than twelve adult males per parish. Taking into consideration the small number of our adult male population who can read and write, a conception may be formed of the absurdity of the expectation, that every parish can adequately supply a constant succession of annual officers competent to perform the very complicate and difficult duties of the levier and collector of rates, and distributor of relief.

The evidence shows a large proportion of the overseers exercising these functions, though unable otherwise to sign their accounts than by their mark, attested by the justice's clerk. But if it was difficult to find a supply of officers for these districts, it would have been preposterous to expect that each district should supply itself with an efficient workhouse, however indispensable that should be as a means of protection to its population. It was found, on an examination of the largest, of the smallest, and of the intermediate parishes, in the seven first counties in England, taken in alphabetical order, that the largest districts gave the lowest cost per head, the smallest gave the greatest cost per head, and those of intermediate size an intermediate cost. The results are thus stated in the Report: The sixty-seven largest parishes gave 9s. $0\frac{3}{4}$d. per head in population; the sixty-six intermediate gave 14s. 4d. per head in population; the sixty-seven least gave 14s. $11\frac{3}{4}$d. per head in population; whilst, if we take all England, there are the still more striking results, viz. the hundred absolutely largest parishes, containing a population of 3,196,064, gave 6s. 7d. per head; the hundred intermediate parishes, containing a population of 19,841, gave 15s. per head; the hundred least parishes from which poor-rate returns are made, with a population of 1708, gave L.1. 11s. $11\frac{1}{2}$d. per head.

Such are the results as tested by the cost of administration in the larger and in the smaller districts; but the moral effects in producing pauperism were as disastrous in the smaller districts. The Commissioners observe, that they "have no recent returns of proportions of paupers in the parishes referred to in the preceding statement; but on referring to the parliamentary returns of the number of paupers in each parish in the years 1803 and 1813, it appears that the number of persons relieved in the large and small parishes bore some proportion to their relative amount of rates. In the three hundred parishes of which the comparative amount of the poor's rates on the population has been stated, the average number of persons relieved was, in the hundred largest parishes, in 1803, 1 in 16, or $6\frac{1}{4}$ per cent.; in 1813, 1 in 13, or $7\frac{3}{4}$ per cent.: in the hundred intermediate ditto, in 1803, 1 in 10, or 10 per cent.; in 1813, 1 in 8, or $12\frac{1}{2}$ per cent.; and in the hundred smallest ditto, in 1803, 1 in 6, or $16\frac{2}{3}$ per cent.; in 1813, 1 in 4, or 25 per cent." And the progress of the disaster was shown to be most rapid in the smallest districts: thus, "the increase of pauperism on population, from 1803 to 1813, was, in the hundred largest parishes, $1\frac{1}{2}$ per cent.; in the hundred intermediate ditto, $2\frac{1}{2}$ per cent.; and in the hundred smallest ditto, $8\frac{1}{3}$ per cent." The economy of extended management was thus experimentally proved in every possible direction, and the moral interests were shown to be the same with the pecuniary.

The Commissioners entered largely into the examination of this subject in all its bearings, and ended by recommending "that the central board be empowered to cause any number of parishes which they may think convenient, to be incorporated for the purpose of workhouse management, and for providing new workhouses where necessary; to declare their workhouses to be the common workhouses of the incorporated district, and to assign to those workhouses separate classes of poor, though composed of the poor of distinct parishes, each distinct parish paying to the support of the permanent workhouse establishment, in proportion to the average amount of the expense incurred for the relief of its poor for the three previous years, and paying separately for the food and clothing of its own paupers." This recommendation was adopted by the legislature in all points. The common workhouses are provided for by sections 23, 24, 26; the maintenance of the workhouse and establishment charges is fixed in the proportion of the average expenditure of the three previous years by section 28, with the power of taking future averages; the cost of the maintenance of its individual paupers being borne by each parish, under section 26.

Accounts. The necessity of providing for a clear and uniform system of accounts was shown in an extraordinary manner in the inquiries of the Commission; but it is too obvious to reemedial Measures.

quire further remark, and the previous observations show in some measure the difficulty of obtaining efficient parochial officers, and the necessity of resorting to further means to attain the object.

The Commissioners recommended "that the central board be empowered and required to take measures for the general adoption of a complete, clear, and, as far as may be practicable, uniform system of accounts." This recommendation was also adopted in full by the legislature, the Commissioners' powers being given by section 15, the audit being provided for by sections 46 and 89.

Paid and permanent officers.

Upon the subject of officers, the Commissioners recommend, "that the central board be empowered to incorporate, for the purpose of appointing and paying permanent officers, and for the execution of works of public labour;" and "that the central board be directed to state the general qualifications which shall be necessary to candidates for paid offices connected with the relief of the poor, to recommend to parishes and incorporations proper persons to act as paid officers, and to remove any paid officers whom they shall think unfit for their situations."

This also is adopted in the 46th section of the act, except that the Commissioners have no power to recommend the persons to act as paid officers, but have ample powers to determine, by regulation, the qualification and removal of all paid officers. The chief remaining recommendation affecting the general administration of the law by the Commissioners was, "that the board be required to submit a report annually to one of your majesty's principal secretaries of state, containing, 1. an account of their proceedings; 2. any further amendments which they may think it advisable to suggest; 3. the evidence on which the suggestions are founded; 4. bills carrying those amendments, if any, into effect, which bills the board shall be empowered to prepare with professional assistance."

This is also adopted, as far as the annual report is concerned, without, however, any definition in the act of the subjects upon which the Commissioners are to report, that being left to their discretion and to the condition of affairs to determine, section 5; they are to make a current record of their proceedings, section 4; and they are bound to give any information respecting their proceedings which the secretary of state may at any time call for, section 6.

Remedial Measures.

Settlement law.

The remaining recommendations of the Commissioners relate chiefly to the law of settlement and that of bastardy. These subjects were more important when all who could gain a settlement might claim the benefit of that settlement, without any check. The improved administration, especially the inducements which now act as restraints upon the applications for relief, have diminished the motives to the voluntary pauper to fix his settlement in a good parish, and have proportionally diminished the danger to parishes, both from the attempts of the pauper, and from the exertions of the officers of other parishes to shift their burthens, by giving to their own poor the means to acquire a new settlement elsewhere. The most important change in the settlement law recommended and adopted, was that which repealed the settlement by hiring and service; a settlement which impeded the free circulation, the effects of which in restraining labourers to their parishes, and creating a reliance on their parishes, was shown to constitute the great plague-spot of the poor-law system as it then existed.[1] This law of settlement was repealed by the 64th and 65th sections, as were the settlement by occupation of a tenement without payment of poor-rates by the 66th, and that by apprenticeship to the sea-service by the 67th; and improvements in the whole law of removal, by which great wrong had been mutually done by parishes one to the other, were introduced by the 79th and following sections.

Bastardy law.

The bastardy law had made it a more prudent speculation for a woman to have a family of bastard children than to have an equal number of legitimate children, by enabling her to cast off the burthen of the children, which the widow could not do, and thus to enforce from the parish, and through the parish from whomsoever she charged as the father, such a contribution as would induce her to keep them. This law, also, by subjecting the person charged as the father, and who could not give security to pay, to imprisonment, was a means of terror by which a woman was often enabled to compel a marriage; a means to which recourse was had to an extent almost incredible.[2]

These demoralizing influences the legislature, by the re-

---

[1] "The Reverend R. R. Bailey, chaplain to the Tower, who has had extensive opportunities of observing the operation of the poor-laws in the rural districts, was asked,—'Can you give any instances within your own knowledge, of the operation of the existing law of settlement? I was requested by Colonel Bogson, Kesgrove House, to furnish him with a farming bailiff. I found a man in all respects qualified for his situation; he was working at nine shillings a week in the parish where I lived. The man was not encumbered by a family, and he thankfully accepted my offer; the situation was, in point of emolument, and comfort, and station, a considerable advance; his advantages would have been doubled. In about a week he altered his mind, and declined the situation, in consequence, as I understood, of his fearing to remove from what was considered a good parish to a bad one, the parish to which it was proposed to remove him being connected with a hundred house, in which there is more strict management. I was requested by a poor man, whom I respected, to find a situation for his son in London. The son was a strong young man, working at that time at about eight shillings a week. I eventually succeeded in getting him a good situation of one guinea per week in London, where his labour would have been much less than it was in the country; but when the period arrived at which he was expected in London, he was not forthcoming. It appeared he had altered his mind, and determined not to take the place; as I understood, his reason for refusing to accept it arose from a reluctance to endanger his settlement in his parish. Such are the instances which are continually presented to my observation with respect to the operation of the present system of settlement.'

"Among our present modes of conferring a settlement," says Mr Russell, in the replies to which we have already adverted, "that by hiring and service is incomparably the most pernicious; it tells the poor man that he shall encounter a prohibitory duty in every market in which he attempts to dispose of the only commodity he must live by selling; it shuts the door against the most respectable and advantageous employment in which a servant can engage; by abridging the term, it impairs the strength of the connection between him and his master; and it not only drives the servant from his place, but often betrays him, during the interval between his being discharged from one house and hired at another, into bad company, dissipation, and vice. (Report, p. 155-6.)

[2] The following is an instance of the testimony as to the operation of the act, given in a letter from the overseer of Llanasa, in the county of Flint, in answer to an inquiry from the board, "Why the bastards in the parish are so few now? I can only observe, that, in the first place, we never force the putative father to marry the mother; and we compel the mother, as well as the father, to pay her quota towards the maintenance of the child. This was our simple mode of treating the business. One thing I must observe, and it tells well for the new poor-law act, that in our parish we have from fifteen to twenty weddings in the year, and it seldom happened that at the ceremony the bride did not think it decent and requisite (I am now speaking of the lower order of persons) to conceal her shape under a cloak. But in the eighteen marriages which we have had since last August, all the ladies, except one, retained their virgin shape, and appeared without the mantle." (First Annual Report, pp 57, 58.)

"An unmarried girl, upon leaving the workhouse after her fourth confinement, said to the master, 'Well, if I have the good luck to have another child, I shall draw a good sum from the parish; and, with what I can earn myself, shall be better off than any married woman in the parish;' and the master added, that she had met with the good luck she hoped for, as she told him, a short time before I was at Holbeach, that she was five months gone with child. I asked him what she had for each child? He answered, two commendation of the commissioners, deprived of further effect, *first*, by rendering the mother of a bastard liable for its maintenance, in the like manner as a widow for the maintenance of her legitimate children, section 71; *secondly*, by rendering it unlawful to pay to her any sums which the putative father might be compelled to contribute for the reimbursement of the parish; and *thirdly*, by rendering it necessary that evidence additional to that of the mother should be required to corroborate her charge against the person accused of being the father.

Such, in the main, were the recommendations of the commissioners, the views with which they were urged, and those with which they were adopted by the legislature. Other provisions were also adopted, necessary, indeed, to give effect to these more important purposes, but not of sufficient importance, or sufficiently characteristic of any great principle, to require remark here.

The like remark applies to a considerable bulk of subsequent legislation, enacted for the purpose mainly of giving effect in detail to the first principles of the Poor-Law Amendment Act, and of modifying the old law in many particulars, to accommodate it to the wants of the present time. Such incidental legislation must continue in almost every session, until the proper step is taken of abolishing wholly the vast mass of obsolete legislation accumulated during two centuries and a half, and of re-enacting, in one consistent whole, such portions of it as are now of practical use. The whole of the legislation subsequent to 1834 will be found described, with the occasions and motives of the several modifications, in the annual reports of the Poor-Law Commission and the Poor-Law Board.

CHAPTER V.

EFFECTS OF THE AMENDED SYSTEM.

It has been thought most desirable to set forth thus fully the history of the mischiefs of the English poor-laws, and the description of the remedies devised for their removal; for the danger of like mischiefs still lurks in the system; it has not been radically extirpated by any general change of principle, and is only kept at arm's length by an improvement in the administration of the law, which is the subject of constant attack, and in so far as one of its main points is concerned, the central board, is still only renewed by annual acts from year to year.

But the history of the operations subsequently to 1834 may be given in less detail, more especially because the whole is accessible at a very small cost in the annual reports of the Poor Law Commission.

Progress of organization.

The first important step in bringing into operation the improved system of administration was the combination of the parishes, individually too small to supply or provide a good machinery, into unions of parishes, and to place these under the management of boards of guardians, elected annually by the rate-payers of each parish, to provide for the appointment of permanent paid officers, to establish workhouses and to regulate the modes of relief and employment of the poor relieved, and to regulate the mode of accounting for all funds received or expended, and an efficient mode of periodical audit. When parishes were large and populous enough to provide separately these essentials of effective administration, they were in some cases merely placed under boards of guardians; and when under previous acts an organization existed similar to that of unions or boards of guardians under the Poor-Law Amendment Act, these have been retained.

It appears from the reports of the commissioners that the local divisions of England and Wales are now such as may be seen in the following table:—

Authority.	Description.	Number of Parishes.
Poor-Law Amendment Act	585 Unions	13,964
	20 Single parishes	20
Local acts (various)	21 Unions	320
	15 Single parishes	15
Gilbert's Act (22 Geo. III., c. 83)	12 Unions	200
	2 Single parishes	2
43 Elizabeth, cap. 2	89 Parishes (including the Scilly Islands as one parish)	89
	Total	14,610

Of these unions and parishes, organized and acting in like manner as in unions, 111 were declared and organized in the first year, 252 in the second, 205 in the third year, and 17 in the fourth year. These unions have since become the districts of administration of the act for the registration of births, deaths, and marriages. Each union is administered by a board of guardians, one guardian at least being elected for each parish or townland. This board meets in most cases weekly; but many instances exist where, by improved skill in the performance of their functions, and by diminished pauperism, they are enabled to perform their duties efficiently by meeting once a fortnight.

Within the four years succeeding 1834 as many as 328 unions had workhouses completed and in operation; and 141 had workhouses building, or in course of alteration. In subsequent years the provision has been slowly carried out in other unions and parishes; and at length nearly the whole country is provided with this requisite of good management. The whole amount expended in providing new workhouses up to the 31st December 1857 was L.4,168,759, 5s. 1d., and in altering and enlarging old workhouses, L.792,772, 14s. 2d.; in all, L.4,961,531, 19s. 3d. Besides these amounts expended in workhouses, L.137,665, 10s. 6d. has been expended in providing separate school-buildings for pauper children. Each union is provided with the following officers:—A clerk (usually a professional man), auditor, chaplain, medical officers, relieving-officers, master and matron of the workhouse, schoolmaster and schoolmistress, and porter.

These arrangements involve a large expenditure, but are indispensable to secure the advantages of an improved administration, and of the vastly preponderating saving derivable only from a better system. The first efforts of the improved administration were great and striking, and many of the most valuable of the results are still in full operation. The greatest and most demoralizing and dangerous of all abuses, the creation and maintenance of a great mass of able-bodied pauperism received at once a check which has remained in full force, and is still reducing the amount of old pauperism of this kind, and preventing a new growth which would otherwise have surely succeeded to the old. The system which demoralized employers as well as labourers, the payment of wages, in whole or in part, by the relief of people while in employment, was immediately stopped by the introduction of the new law. On the other hand, the converse abuse, which, in proportion as able-bodied pauperism was encouraged in any parish, caused the really impotent and destitute to be neglected, is in nearly as great a degree corrected. The improved conduct of the

---

shillings; and that women in that neighbourhood could easily earn five shillings a week all the year through. Thus she will have fifteen shillings a week." (Ibid., p. 172.)

"At Nuneaton, the solicitor to the parish, Mr Greenaway, stated that his house looked into the churchyard; that he was in the habit purposely of watching the persons resorting to the church for marriage, and that he could confidently say, that seventeen out of every twenty of the female poor who went there to be married were far advanced in pregnancy." (Ibid., 173.)

Amended System.

labourers was in the first years very striking, and the improved morality of the women by the alteration of the bastardy law, was in the same period equally remarkable. The testimony and the instances are fully displayed in the earlier reports of the commissioners, especially in their second report, and in the reports of two committees of the House of Commons in 1836–37 and 1837–38. The exact operation in reducing able-bodied pauperism throughout the country, and in conducting the relief into its more legitimate channels, cannot be stated, the statistics of relief being at first too partial and vague to allow of any satisfactory combination; but of late years the numbers of the poor of all classes have been regularly ascertained on the 1st of January and the 1st of July in each year, and the details published in the annual reports. The general result may be seen in the following table:—

Years ended at Lady-Day.	Population of England and Wales.	The Average Number of *Paupers of all Classes* (including Children) at one time in receipt of Relief in England and Wales.			Ratio per Cent. of Paupers Relieved on the Population.	The Average Number of *Adult Able-bodied Paupers* (exclusive of vagrants) at one time in receipt of Relief in England and Wales.			Ratio per Cent. of Adult Able-bodied Paupers on the Total Number of Paupers of all Classes Relieved.	Average price of Wheat per Quarter.	
		In-door.	Out-door.	Total.		In-door.	Out-door.	Total.		*s.*	*d.*
1849	17,534,000	133,514	955,146	1,088,659	6·2	26,558	202,265	228,823	21·0	49	1
1850	17,765,000	123,004	855,696	1,008,700	5·7	24,095	167,815	191,910	19·0	42	7
1851*	17,927,609	114,367	826,948	941,315	5·3	20,876	142,248	163,124	17·3	39	11
1852	18,265,000	111,323	804,352	915,675	5·0	18,455	130,705	149,160	16·3	39	4
1853	18,402,000	110,148	875,214	886,362	4·8	17,649	121,926	139,575	15·7	42	0
1854	18,617,000	111,635	752,982	864,617	4·6	18,237	116,954	135,191	15·6	61	7
1855	18,840,000	121,400	776,286	897,686	4·8	20,669	125,962	146,631	16·3	70	0
1856	19,043,000	124,879	792,205	917,084	4·8	21,359	132,869	154,228	16·8	75	4
1857	19,207,000	122,845	762,165	885,010	4·6	19,660	120,415	140,075	15·8	65	3

* The population for 1851 is that given in the Census; that for the other years is estimated.

It appears from this table, compared with the account of expenditure in the same years, that while the cost of relief has been on the whole considerably increased, the whole number of paupers has decreased by more than one quarter, or as 62 to 46; and what is a more satisfactory result still, the proportion of the able-bodied paupers has decreased in a far larger ratio, or as 57 to 35, or nearly from 5 to 3.

Litigation.

A consequence of the extreme subdivision of the country for such purposes as that of the poor-laws, was seen in the extent to which contests were begotten between parish and parish, and between rate-payers and officers. The effect of the amended system was seen as rapidly as the system itself was brought into operation. The costs of litigation, and the expenditure in the removal of paupers, was in 1833–34, L.258,604; in 1834–35, L.202,527; in 1835–36, L.172,482; in 1836–37, L.126,951; in 1837–38, L.93,982: in the years 1856–57 it is returned as L.59,163, 14s.

General effects.

The act of 1834 was not passed without encountering a formidable opposition. The carrying of the act into execution necessarily involved a most extensive interference with old habits both in the poor and the rich, with private interests most widely diffused in the perpetuation of old abuses. It was never established that any one case of real hardship was encountered through the operation of the law; but necessarily many partial mistakes were made, and instances were not infrequent of injudicious zeal. Cases, however, were innumerable in which loud complaints were made, and those were used successfully to influence the public mind, which had never been generally well informed on the subject. About the time when the act had got into full operation, and when it might have been expected that its full effects in the extirpation of dishonest pauperism and vagrancy, and in confining relief to its proper purposes would soon be realized, the opposition was successful in checking, and almost entirely arresting, the further progress of the measure. Still the main provisions of the act had been brought into action: unions were formed, boards of guardians and paid officers and auditors appointed, and all had been abundantly instructed by the great mass of information diffused in the dangers to be avoided and the principles to be kept in view. The result has been thus far favourable, that what was already secured in good administration has been retained, the dangers of increasing pauperism kept well at bay, and the diminution by natural causes in the numbers of paupers has not been allowed to be quite filled up by a new growth. On the whole, it may be safely concluded that pauperism is on the decrease, while on occasions of general distress the relief is adequately increased and adapted to the circumstances, without the danger of the occasional relaxation becoming the permanent rule; and that a very intelligent body of administrators has been created, of which the community has found the benefit in the introduction of many measures of general utility.

The following table may be compared with that given at page 306, and will show the pecuniary effects of the first operations of the new law in the years 1834–37 inclusive, and the results of the more inert administration of subsequent years:—

Years ending at Lady-Day.	Estimated Population.	The Total expended in Relief to the Poor.	Rate per Head of Amount expended in Relief to the Poor on the estimated Population.	
		L.	*s.*	*d.*
1834	14,372,000	6,317,255	8	9½
1835	14,564,000	5,526,418	7	7

1855	18,840,000	5,890,041	6	3
1856	19,043,000	6,004,244	6	3¾
1857	19,207,000	5,898,756	6	1¾

Average of the 24 years (1834 to 1857), 6s. 2d.

Amended System.

The whole progress of expenditure, so far as there are any authentic records of the facts, may be seen in the following table:—

Parochial Years.	Amount of Poor-Rates levied.	Amount thereof expended in Relief to the Poor.	Reference to the official Publication of the Return.
	L.	L.	
1747-48* 1748-49* 1749-50*	...	689,971 (average)	First Report of Select Committee of the House of Commons on Poor-Laws, session 1752.
1775-76*	1,720,317	1,556,804	Second Report of Select Committee of the House of Commons on Poor-Laws, session 1777.
1782-83* 1783-84* 1784-85*	2,167,750 (average)	2,004,238 (average)	Report from Select Committee of the House of Commons on certain Returns relative to the State of the Poor, session 1787.
1802-3*	5,348,205	4,077,891	Abstract of Returns relative to the Poor, House of Commons, Paper No. 175, session 1804.

1856-57	8,139,003	5,898,756	10th ditto, ditto.

* The parochial year ended at Easter, up to and inclusive of the year 1813-14; since that time, it has always terminated at Lady-day.

For the present, public opinion in England appears to be satisfied with this result, in which the existing mass of pauperism is tolerated, and a permanent succession of similar pauperism is permitted; but in which, at the same time, the revival of the yet more dangerous forms of the evil prevailing and extending indefinitely up to the year 1834, appears to be effectually prevented. It is probable that if the evil does not greatly increase, its continuation in its present forms and proportions will for some time to come be regarded with contentment, or indeed with satisfaction.

Even the attempts that have been made to amend the Law of Settlement and Removal,—a law which was created for purposes now long since obsolete, and for the maintenance of which it is difficult to find any sustainable argument of any force,[1]—have met with no encouragement.[2] The consolidation of the various acts of Parliament from 1603, amounting to above 200 in number, in which the poor-laws are contained, including the most dissonant provisions, of which the great mass are wholly incapable of any possible present application, but which are the foundation of a still greater mass of equally useless judicial authority, all of which might be easily reduced into the bulk of an act of Parliament of about 120 succinct and intelligible clauses, has, although the work is represented to have been prepared by an able hand, and ready for adoption ever since 1854, met with no administrative or parliamentary or popular encouragement.[3] (G. C.)

POPAYAN, a town of New Granada, capital of the department of Cauca, stands near the source of the river Cauca, at an elevation of 5824 feet above the sea, 230 miles S.W. of Bogota. It is regularly laid out and well built, consisting for the most part of brick houses one storey high. Of its many squares, one is very large and handsome. The town contains a university, a Jesuit college, a cathedral, and several other churches and convents, besides other public buildings. Popayan has declined considerably from its former condition, both in population and commercial importance. There was at one time a considerable trade in the precious metals carried on here; but since the revolution these articles have been conveyed by different channels, and there is now at Popayan only some little traffic in woollen fabrics, salt, and agricultural produce. This was the earliest town built by Europeans in this part of America, having been founded by Benalcazar in 1537. Pop. 20,000.

POPE, a name which comes from the Greek word Πάπα, and signifies *Father*. In the East this appellation is given to all Christian priests, and in the West bishops were called by it in ancient times; but since the time of Gregory VII. it has been appropriated to the Bishop of Rome, whom the Roman Catholics look upon as the common father of all Christians.

Within the last two or three centuries much has been said and written, and many warm disputes have been carried on, concerning the Pope, and the power belonging to him. All those in communion with the see of Rome unanimously hold that our Saviour Jesus Christ constituted St Peter the apostle chief pastor under himself, to watch over his whole flock here upon earth, and to preserve the unity of the church, at the same time giving him the power requisite for these ends. They also believe that our Saviour ordained that St Peter should have successors with the like authority and power to the end of time. Now, as they allege that St Peter resided for many years at Rome, and there suffered martyrdom, they consider the bishops of Rome as his successors in the dignity and office of the universal pastor of the whole Catholic church.

There have been some varieties in the manner of choosing the bishop of Rome in different ages, as alterations may be made in discipline; but still the clergy of Rome have always had the chief part in the election; and that clergy is now represented by, or in some manner consists of the cardinals, who have for several centuries been the sole electors of the Pope.

These cardinals, or principal persons of the Church of Rome, are seventy in number, when the Sacred College, as it is called, is complete. Of these, six are cardinal bishops,—viz., the bishops of Ostia, Porto, Albano, Sabino, Tusculum or Frascati, and Præneste or Palestrina, which are the six suburbicarian churches; fifty are cardinal priests, who have all titles from parish churches in Rome; and fourteen are cardinal deacons, who have their titles from churches in Rome of less note, called *diaconias* or deaconries. These cardinals are created by the Pope when there happen to be vacancies. Sometimes he names one or two only at a time; but commonly he defers the promotion until there be ten or twelve vacancies or more; and then at every second promotion, the emperor, the kings of Spain and France, and of Great Britain when Catholic, are allowed to present one each, to be made cardinal, whom the Pope always admits if there be not some very great and evident objection. These cardinals are commonly promoted from amongst such clergymen as have borne offices in the Roman court; some are assumed from religious orders; and eminent ecclesiastics of other countries are likewise often honoured with this dignity. Sons of sovereign princes have frequently been members of the sacred college. Their distinctive dress is scarlet, to signify that they ought to be ready to shed their blood for the faith and the church, when the defence and honour of either require it. They wear a scarlet cap and hat. The cap is given to them by the Pope if they are at Rome, and is sent to them if they are absent; but the hat is never given but by the Pope's own hand. These cardinals form the Pope's standing council or consistory for the management of the public affairs of church and state. They are divided into different congregations, for the more easy despatch of business; and some of them hold the principal offices in the pontifical court,—as that of cardinal-vicar penitentiary, chancellor, camerlingo or chamberlain, prefect of the signature of justice, prefect of memorials, and secretary of state. They have the title of *eminence* and *most eminent* given them. But here we consider them principally as the persons entrusted with the choice of the Pope.

On the demise of a Pope, his pontifical seal is immediately broken by the chamberlain, and all public business is interrupted that can be delayed. Messengers are despatched to all the Catholic sovereigns to acquaint them of the event, that they may take what measures they think proper, and that the cardinals in their dominions, if any there be, may hasten to the future election if they choose to attend; whilst the whole attention of the sacred college is turned to the preservation of tranquillity in the city and state, and to the necessary preparations for the future election. The cardinal chamberlain, during the vacancy of the Holy See, possesses great authority; he coins money with his own arms on it, lodges in the Pope's apartments, and is attended by bodyguards. He, and the first cardinal bishop, the first cardinal priest, and the first cardinal deacon, have during that time the government almost entirely in their hands. The body of the deceased Pope is carried to St Peter's, where funeral service is performed for him with great pomp during nine days, and the cardinals attend there every morning. In the meantime, all necessary preparations for the election are made; and the place where they assemble for that purpose, which is called the *conclave*, is fitted up in that part of the Vatican palace which is nearest St Peter's church, as this has long been thought the most convenient situation. Here is formed by partitions of wood a number of cells or chambers equal to the number of cardinals, with a small distance between every two, and a broad gallery before them. A number is put upon every cell, and small papers with corresponding numbers are put into a box. Every cardinal, or some one for him, draws out one of these papers, which determines in what cell he is to lodge. The cells are lined with cloth; and there is a part of each one separated for the conclavists or attendants, of whom two are allowed to each cardinal, and three to cardinal princes. They are persons of some rank, and generally of great confidence; but they must carry in their master's meals, serve him at table, and perform all the offices of a menial servant. Two physicians, two surgeons, an apothecary, and some other necessary officers, are chosen for the conclave by the cardinals.

On the tenth day after the Pope's death, the cardinals who are then in Rome, and in a competent state of health, meet in the chapel of St Peter's, which is called the Gregorian Chapel, where a sermon on the choice of a Pope is preached to them, and mass is said for invoking the grace of the Holy Ghost. Then the cardinals proceed to the conclave in procession two by two, and take up their abode. When all is properly settled, the conclave is shut up, having boxed wheels or places of communication in convenient quarters; and there are also strong guards placed all around. When any foreign cardinal arrives after the inclosure, the conclave is opened for his admission. In the beginning every cardinal signs a paper, containing an obligation that if he shall be raised to the papal chair he will not alienate any part of the pontifical dominion; that he will not be prodigal to his relations; and such other stipulations as may have been settled in former times or framed for the occasion.

We come now to the election itself; and that this may be effectual, two-thirds of the cardinals present must vote for the same person. As this is often not easily obtained, they sometimes remain whole months in the conclave. They meet in the chapel twice every day for giving their votes; and the election may be effected by scrutiny, accession, or acclamation. Scrutiny is the ordinary method, and consists in this: every cardinal writes his own name on the inner part of a piece of paper, and this is folded up and sealed. On a second fold of the same paper a conclavist writes the name of the person for whom his master votes. This, according to the practice observed for some centuries, must be one of the Sacred College. On the outer side of the paper is written a sentence at random, which the voter must well remember. Every cardinal, on entering into the chapel, goes to the altar and puts his paper into a large chalice.

When all are convened, two cardinals number the votes; and if they are more or less than the number of cardinals present the voting must be repeated. When that is not the case, the cardinal appointed for the purpose reads the outer sentence, and the name of the cardinal under it, so that each voter hearing his own sentence and the name joined with it, knows that there is no mistake. The names of all the cardinals that are voted for are taken down in writing, with the number of votes for each; and when it appears that any has two-thirds of the number present in his favour the election is over; but when this does not happen, the voting papers are all immediately burned without opening up the inner part. When several trials of coming to a conclusion by this method of scrutiny have been made in vain, recourse is sometimes had to what is called accession. By it, when a cardinal perceives that one or very few votes are wanting to any one for whom he had not voted at that time, he may say that he accedes to the one who has nearly the number of votes requisite; and if his one vote suffices to make up the two-thirds, or if he is followed by a sufficient number of new voters for the said cardinal, the election is accomplished. Lastly, a Pope is sometimes elected by acclamation; that is, when a cardinal, being pretty sure that he will be joined by a sufficient number, cries out in the open chapel that such a one shall be Pope. If he is supported properly, the election becomes unanimous,—those who would perhaps oppose it foreseeing that their opposition would be fruitless, and rather hurtful to themselves. It is to be observed that the emperor of Germany and the kings of France and Spain claimed a right of excluding one cardinal from being Pope at every election. Hence, when the ambassador at Rome of any of these sovereigns perceived that any cardinal disagreeable to his master was likely to be made Pope, he demanded an audience of the conclave, was admitted, and there declared his master's will, which was always attended to for the common good. But each of those sovereigns was thus allowed to exclude only one at a time, and they unwillingly and seldom put this right in execution.

When a Pope is chosen in any of the three abovementioned ways, the election is immediately announced from the balcony in the front of St Peter's; homage is paid to the new pontiff; and couriers are sent off with the news to all parts of Christendom. The Pope appoints a day for his coronation at St Peter's, and for his taking possession of the patriarchal church of St John Lateran, all which is performed with great solemnity. He is addressed by the title of Holiness, and Most Holy Father.

Let us now proceed to state what authority Roman Catholics attribute to the Pope thus chosen. They believe, then, that the Bishop of Rome is, under Christ, supreme pastor of the whole church; and, as such, is not only the first bishop in order and dignity, but has also a power and jurisdiction over all Christians, to preserve unity and purity of faith and moral doctrine, and to maintain order and regularity in all churches. Wherefore they hold, that when the Pope understands that any error has been broached against faith or manners, or that any considerable difference on such subjects has arisen in any part of Christendom, it belongs to him, after due deliberation and consultation, to issue out his pastoral decree, condemning the error, clearing up the doubt, and declaring what has been handed down, and what is to be believed. Some Catholic divines are of opinion that the Pope cannot err when he thus addresses himself to all the faithful on matters of doctrine. They well know that as a private doctor he may fall into mistakes as well as any other man; but they think that when he teaches the whole church Providence must preserve him from error: and they apprehend that this may be deduced from the promises of Christ to St Peter, and from the writings of the ancient fathers. It is to be observed, however, that this infallibility of the Pope, even when he pronounces in the most solemn manner, is only an opinion, and not an article of Roman Catholic faith. Wherefore, when he sends forth doctrinal decrees, the other bishops, who are also guardians of the faith in an inferior degree, may, with due respect, examine these decrees; and if they find them agree with what has always been taught, they either formally signify their acceptance, or they tacitly acquiesce, which, considering their duty, is equivalent to a formal approbation. When the acceptation of the generality of the bishops has been obtained, either immediately or after some mutual correspondence and explanation, the decrees of the Pope thus accepted come to be the sentence of the whole church, and are believed to be beyond the possibility of error.

Sometimes it happens that the disputes and differences may be so great and intricate that, to the end it may be seen more clearly what has really been delivered down, and to give all possible satisfaction, it may appear proper to convene all the bishops who can conveniently attend at one place, to learn from them more distinctly what has been taught and held in their respective churches. Roman Catholics believe that it belongs to the Pope to call such general councils, and to preside in them in person, or by his legates. They likewise hold, that when the Pope has approved the decrees of such councils concerning faith or manners, such decrees become final, and must be received as such by all Catholics. In all this they believe that the particular assistance of the Holy Ghost is with the pastors of the church, and that therefore "the gates of hell shall not prevail against it."

The see of Rome, according to the Roman Catholics, is the centre of Catholic unity. All their bishops communicate with the Pope, and by his means with one another, and so form one body. However distant their particular churches may be, they all meet at Rome either in person or by their delegates, or at least by their letters; and, according to the discipline of the latter ages, though they are presented to the Pope for their office from their respective countries, yet from him they must receive their bulls of consecration before they can take possession of their sees.

In matters of ecclesiastical discipline the Pope, as chief pastor, not only must take care that the canons actually in force be observed in all churches, but he may also make new canons and regulations when he sees it necessary or expedient for the spiritual benefit of the faithful, according to times and circumstances. But in doing this he must not infringe the established rights or customs to the injury of any person; which if, through mistake or wrong information, he should ever do, the persons who think themselves aggrieved may remonstrate with respect and sue for redress. He may establish new episcopal sees where there have been none before, and he may alter the limits of former dioceses; but in such alterations he always of course consults the temporal sovereign, if in communion with him. He sends pastors to preach the gospel to all countries where the Catholic religion is not by law established; and to him appeals may be made from all parts of Christendom in ecclesiastical causes of importance.

The Pope may dispense with the observation of ecclesiastical canons when there are just reasons for it; he may—as indeed any man may—also dispense with vows when they are made with the express or tacit condition that he really may dispense with them; he may also, on some occasions, declare that obligations have really ceased when that is truly the case, from a great alteration of circumstances. But he can never grant any dispensation to the injury of any third person, and can never allow any one to do what is unjust, or to say what he knows to be false, whatever advantage might be expected to accrue from it.

The reader who wishes to learn what may be urged for and against the supremacy of the Pope, and who is fitted by his knowledge of ecclesiastical history to understand the nature of the question at issue, may consult, on the one hand, the works of Bellarmine, with the chapter on Supremacy in Milner's *Letters to a Prebendary;* and on the other, Barrow's treatise *On the Pope's Supremacy*, together with Chillingworth's *Religion of Protestants.*

Appended is a general list of the Popes, with the dates of their election, from the time of Sylvester I., in 314 A.D., during whose pontificate Constantine convoked the great council of Nicæa, where it was decreed that the Bishop of Rome should be primate over the churches of those provinces which, in civil matters, were subject to the jurisdiction of the "Vicarius Urbis," or imperial vicar of Rome:—

POPE.[1]

POPE, *Alexander*, the most brilliant of all wits who have at any time applied themselves to the poetic treatment of human manners, to the selecting from the play of human character what is picturesque, or the arresting what is fugitive, was born in the city of London on the 21st[2] day of May in the memorable year 1688; about six months, therefore, before the landing of the Prince of Orange, and the opening of that great revolution which gave the final ratification to all previous revolutions of that tempestuous century. By the "city" of London the reader is to understand us as speaking with technical accuracy of that district which lies within the ancient walls and the jurisdiction of the lord mayor. The parents of Pope, there is good reason to think, were of "gentle blood," which is the expression of the poet himself when describing them in verse. His mother was so undoubtedly; and her illustrious son, in speaking of her to Lord Hervey at a time when any exaggeration was open to an easy refutation, and writing in a spirit most likely to provoke it, does not scruple to say, with a tone of dignified haughtiness not unbecoming the situation of a filial champion on behalf of an insulted mother, that by birth and descent she was not below that young lady (one of the two beautiful Miss Lepels) whom his lordship had selected from all the choir of court beauties as the future mother of his children. Of Pope's extraction and immediate lineage for a space of two generations we know enough; beyond that we know little: of this little a part is dubious; and what we are disposed to receive as *not* dubious rests chiefly on his own authority. In the prologue to his *Satires*, having occasion to notice the lampooners of the times, who had represented his father as "a mechanic, a hatter, a farmer, nay, a bankrupt," he feels himself called upon to state the

---

[1] [This interesting memoir of Pope was contributed to the previous edition of the Encyclopædia by Mr DE QUINCEY. It is retained in the present edition, as presenting a valuable critical estimate and analysis of a great English classic, by one of the most acute and scholastic writers of the age. It has been deemed necessary, however, to make a few additions (inclosed within brackets) embodying the results of some of the recent investigations into the history of Pope.]

[2] Dr Johnson, however, and Joseph Warton, for reasons not stated, have placed his birth on the 22d. To this statement, as opposed to that which comes from the personal friends of Pope, little attention is due. Ruffhead and Spence, upon such questions, must always be of higher authority than Johnson and Warton, and *à fortiori* than Bowles. But it ought not to be concealed, though hitherto unnoticed by any person, that some doubt after all remains whether *any* of the biographers is right. An anonymous writer, contemporary with Pope, and evidently familiar with his personal history, declares that he was born on the 8th of June; and he connects it with an event that, having a public and a partisan interest (the birth of that Prince of Wales who was known twenty-seven years afterwards as the Pretender), would serve to check his own recollections, and give them a collateral voucher. It is true he wrote for an ill-natured purpose; but no purpose whatever could have been promoted by falsifying this particular date. What is still more noticeable, however, Pope himself puts a most emphatic negative upon all these statements. In a pathetic letter to a friend, when his attention could not have been wandering, for he is expressly insisting upon a sentiment which will find an echo in many a human heart, viz., that a birthday, though from habit usually celebrated as a festal day, too often is secretly a memorial of disappointment, and an anniversary of sorrowful meaning, he speaks of the very day on which he is then writing as his own birthday; and indeed what else could give any propriety to the passage? Now the date of this letter is January 1, 1733. Surely Pope knew his own birthday better than those who have adopted a random rumour without investigation. [Mr De Quincey's memory has here misled him; no date is affixed by Pope to this letter. Allusion is made in it to the death of Congreve as a very recent occurrence; and as Congreve died on the 19th of January $172\frac{8}{9}$, it may be inferred that Pope's birthday was near the time of Congreve's decease, in the latter end of January or beginning of February. But in preparing his letters for the press, Pope altered and revised them; sometimes making one printed epistle out of two or more written ones, and little or no reliance can be placed on the poet's dates.]

But, whilst we are upon this subject, we must caution the readers of Pope against too much reliance upon the chronological accuracy of his editors. *All* are scandalously careless; and generally they are faithless. Many allusions are left unnoticed, which a very little research would have illustrated; many facts are omitted, even yet recoverable, which are essential to the just appreciation of Pope's satirical blows; and dates are constantly misstated. Mr Roscoe is the most careful of Pope's editors; but even he is often wrong. For instance, he has taken the trouble to write a note upon Pope's humorous report to Lord Burlington of his Oxford journey on horseback with Lintot; and this note involves a sheer impossibility. The letter is undated, except as to the month; and Mr Roscoe directs the reader to supply 1714 as the true date, which is a gross anachronism. For a ludicrous anecdote is there put into Lintot's mouth, representing some angry critic, who had been turning over Pope's *Homer* with frequent *pshaws*, as having been propitiated, by Mr Lintot's dinner, into a gentler feeling towards Pope, and finally, by the mere effect of good cheer, without an effort on the publisher's part, as coming to a confession, that what he ate and what he had been reading were equally excellent. But in the year 1714, *no part* truth about his parents; and naturally much more so at a time when the low scurrilities of these obscure libellers had been adopted, accredited, and diffused by persons so distinguished in all points of personal accomplishment and rank as Lady Mary Wortley Montagu and Lord Hervey: "*hard as thy heart,*" was one of their lines in their joint pasquinade, "*hard as thy heart, and as thy birth obscure.*" Accordingly he makes the following formal statement:—"Mr Pope's father was of a gentleman's family in Oxfordshire, the head of which was the Earl of Downe. His mother was the daughter of William Turner, Esq., of York; she had three brothers, one of whom was killed; another died in the service of King Charles [meaning Charles I.]; the eldest, following his fortunes, and becoming a general officer in Spain, left *her* what estate remained after the sequestrations and forfeitures of her family." The sequestrations here spoken of were those inflicted by the commissioners for the Parliament; and usually they levied a fifth, or even two-fifths, according to the apparent delinquency of the parties. But in such cases two great differences arose in the treatment of the royalists; first, that the report was coloured according to the interest which a man possessed, or other private means for biassing the commissioners; secondly, that often, when money could not be raised on mortgage to meet the sequestration, it became necessary to sell a family estate suddenly, and therefore in those times at great loss; so that a nominal fifth might be depressed by favour to a tenth, or raised by the necessity of selling to a half. And hence might arise the small dowry of Mrs Pope, notwithstanding the family estate in Yorkshire had centred in her person. But, by the way, we see from the fact of the eldest brother having sought service in Spain, that Mrs Pope was a Papist; not, like her husband, by conversion, but by hereditary faith. This account, as publicly thrown out in the way of challenge by Pope, was, however, sneered at by a certain Mr Pottinger of those days, who, together with his absurd name, has been safely transmitted to posterity in connection with this single feat of having contradicted Alexander Pope. We read in a diary published by the Microcosm, "*Met a large hat with a man under it.*" And so, here, we cannot so properly say that Mr Pottinger brings down the contradiction to our times, as that the contradiction brings down Mr Pottinger. "Cousin Pope," said Pottinger, "had made himself out a fine pedigree, but he wondered where he got it;" and he then goes on to plead in abatement of Pope's pretensions, "that an old maiden aunt, equally related" (that is, standing in the same relation to himself and to the poet), "a great genealogist, who was always talking of her family, never mentioned this circumstance." And again we are told, from another quarter, that the Earl of Guildford, after express investigation of this matter, "was sure that," amongst the descendants of the Earls of Downe, "there was none of the name of Pope." How it was that Lord Guildford came to have any connection with the affair, is

---

of Pope's *Homer* was printed. June 1715 was the month in which even the subscribers first received the four earliest books of the *Iliad*, and the public generally not until July. This we notice by way of specimen. In itself, or as an error of mere negligence, it would be of little importance; but it is a case to which Mr Roscoe has expressly applied his own conjectural skill, and solicited the attention of his reader. We may judge, therefore, of his accuracy in other cases which he did not think worthy of examination. [The letter contains a reference to Lord Lansdowne's committal to the Tower, which serves to fix the date between September 1715 and February $171\frac{6}{7}$, when he was released.]

There is another instance, presenting itself in every page, of ignorance concurring with laziness on the part of all Pope's editors, and with the effect not so properly of misleading as of perplexing the general reader. Until Lord Macclesfield's bill for altering the style in the very middle of the eighteenth century, six years therefore after the death of Pope, there was a custom, arising from the collision between the civil and ecclesiastical year, of dating the whole period that lies between December 31st and March 25th (both days *exclusively*) as belonging indifferently to the past or the current year. This peculiarity had nothing to do with the old and new style, but was, we believe, redressed by the same act of Parliament. Now in Pope's time it was absolutely necessary that a man should use this double date, because else he was liable to be seriously misunderstood. For instance, it was then always said that Charles I. had suffered on the 30th of January $164\frac{8}{9}$; and why? Because, had the historian fixed the date to what it really was, 1649, in that case all those (a very numerous class) who supposed the year 1649 to commence on Ladyday, or March 25, would have understood him to mean that this event happened in what we *now* call 1650, for not until 1650 was there any January which *they* would have acknowledged as belonging to 1649, since *they* added to the year 1648 all the days from January 1 to March 24. On the other hand, if he had said simply that Charles suffered in 1648, he would have been truly understood by the class we have just mentioned; but by another class, who began the year from the 1st of January, he would have been understood to mean what we *now* mean by the year 1648. There would have been a sheer difference, not of one, as the reader might think at first sight, but of *two* entire years in the chronology of the two parties; which difference, and all possibility of doubt, is met and remedied by the fractional date $\frac{1648}{1649}$; for that date says in effect it was 1648 to you who do not open the new year till Ladyday; it was 1649 to you who open it from January 1. Thus much to explain the real sense of the case; and it follows from this explanation, that no part of the year ever *can* have the fractional or double date except the interval from January 1 to March 24 inclusively. And hence arises a practical inference,—viz., that the very same reason, and no other, which formerly enjoined the use of the compound or fractional date,—viz., the prevention of a capital ambiguity or dilemma, now enjoins its omission. For in our day, when the double opening of the year is abolished, what sense is there in perplexing a reader by using a fraction which offers him a choice without directing him how to choose. In fact, it is the *denominator* of the fraction, if one may so style the lower figure, which expresses to a modern eye the true year. Yet the editors of Pope, as well as many other writers, have confused their readers by this double date; and why? Simply because they were confused themselves. Many errors in literature of large extent have arisen from this confusion. Thus it was said properly enough in the contemporary accounts—for instance, in Lord Monmouth's *Memoirs*—that Queen Elizabeth died on the last day of the year 1602, for she died on the 24th of March; and by a careful writer this event would have been dated as March 24, $\frac{1602}{1603}$. But many writers, misled by the phrase above cited, have asserted that James I. was proclaimed on the 1st of January 1603. Heber, Bishop of Calcutta, again, has ruined the entire chronology of the life of Jeremy Taylor, and unconsciously vitiated the facts, by not understanding this fractional date. Mr Roscoe even too often leaves his readers to collect the true year as they can: thus, *e.g.*, at p. 500 of his Life, he quotes from Pope's letter to Warburton, in great vexation for the surreptitious publication of his letters in Ireland, under date of February 4, $174\frac{0}{1}$. But why not have printed it intelligibly as 1741? Incidents there are in most men's lives which are susceptible of a totally different moral value, according as they are dated in one year or another. That might be a kind and honourable liberality in 1740 which would be a fraud upon creditors in 1741. Exile to a distance of 10 miles from London in January 1744, might argue that a man was a turbulent citizen and suspected of treason; whilst the same exile in January 1745 would simply argue that, as a Papist, he had been included amongst his whole body in a general measure of precaution to meet the public dangers of that year. This explanation we have thought it right to make, both for its extensive application to *all* editions of Pope, and on account of the serious blunders which have arisen from the case when ill understood; and because, in a work upon education, written jointly by Messrs Lant Carpenter and Shephard, though generally men of ability and learning, this whole point is erroneously explained.

not stated by the biographers of Pope; but we have ascertained that, by marriage with a female descendant from the Earls of Downe, he had come into possession of their English estates.

Finally, though it is rather for the honour of the Earls of Downe than of Pope to make out the connection, we must observe that Lord Guildford's testimony, *if ever given at all*, is simply negative; he had found no proofs of the connection, but he had not found any proofs to destroy it; whilst, on the other hand, it ought to be mentioned, though unaccountably overlooked by all previous biographers, that one of Pope's anonymous enemies, who hated him personally, but was apparently master of his family history, and too honourable to belie his own convictions, expressly affirms, of his own authority, and without reference to any claim put forward by Pope, that he was descended from a junior branch of the Downe family; which testimony has a double value—first, as corroborating the probability of Pope's statement viewed in the light of a fact; and, secondly, as corroborating that same statement viewed in the light of a current story, true or false, and not as a disingenuous fiction put forward by Pope to confute Lord Hervey.

[Sir Thomas Pope, the founder of the Downe family, was of humble origin, the son of a yeoman at Deddington in Oxfordshire. He was enriched by the spoils of the church at the period of the Reformation, but died without issue. His brother was raised to the peerage in 1628. If, therefore, the poet's ancestors were allied to this family, it must have been long before the creation of the peerage, through the Deddington yeoman.]

It is probable to us that the Popes, who had been originally transplanted from England to Ireland, had, in the person of some cadet, been re-transplanted to England; and that having in that way been disconnected from all personal recognition, and all local memorials of the capital house, by this sort of *postliminium*, the junior branch had ceased to cherish the honour of a descent which was now divided from all direct advantage. At all events, the researches of Pope's biographers have not been able to trace him farther back in the paternal line than to the grandfather; and he (which is odd enough, considering the Popery of his descendants), was a clergyman of the Established Church in Hampshire. This grandfather had two sons: of the eldest nothing is recorded beyond the three facts, that he went to Oxford, that he died there, and that he spent the family estate.[1] The younger son, whose name was Alexander, had been sent when young, in some commercial character, to Lisbon;[2] and there it was, in that centre of bigotry, that he became a sincere and most disinterested Catholic. He returned to England; married a Catholic young widow; and became the father of a second Alexander Pope, *ultra Sauromatus notus et Antipodes.*

[The maternal ancestry of the poet has been minutely traced by the eminent archæologist Mr Joseph Hunter, and by Mr Robert Davies of York. Edith Turner was not a widow when she married Alexander Pope. She was born at Worsborough Dale, Yorkshire, and baptized June 18, 1642. She would thus seem to have been of the same age as her husband, both being in their forty-sixth year at the date of the poet's birth. The Turners were a family of long standing and good consideration in the county of York. The poet's grandfather, William Turner, inherited from his uncle the manor of Towthorpe, lands in Ruston, with a rent-charge of L.70 on the manor of Ruston, and houses in the city of York. The rent-charge of L.70 formed part of the dowry of Edith Turner, the last survivor of the family of fourteen children; and on the death of both his parents, it descended to the poet. William Turner died at York in 1665, his widow in 1681. "When upon the death of Mrs Turner," says Mr Davies, "the daughters who had remained under the maternal roof at York had to seek a home with married sisters in other parts of the kingdom, in was Edith's lot to remove to London, where she became the wife of Alexander Pope, and the mother of the poet." One of the sisters was married to Samuel Cooper, the celebrated miniature portrait-painter. Mrs Cooper was the poet's godmother, and by her will she left her godson, then only five years of age, her "painted china dish with a silver foot and a dish to set it in;" and after her sister Elizabeth Turner's decease, all her books, pictures, and medals. Of the "sequestration and forfeitures of the family," mentioned by Pope, no trace has been found; and of three brothers, one, William, was the sole survivor in 1665. The antiquaries have not been so successful with the poet's paternal ancestry. It has been found, however, that at the proper period, from 1631 to 1645, there was a Hampshire clergyman of the name of Alexander Pope. He had the rectory of Thruxton, and two other livings; but as there is no memorial of him in the church, and no entry in the register of his having had children, it is still doubtful whether this rector of Thruxton was the poet's grandfather. The name was by no means an uncommon one.]

By his own account to Spence, Pope learned "very early to read;" and writing he taught himself "by copying from printed books;" all which seems to argue that, as an only child, with an indolent father and a most indulgent mother, he was not molested with much schooling in his infancy. Only one adventure is recorded of his childhood,—viz., that he was attacked by a cow, thrown down, and wounded in the throat.

Pope escaped this disagreeable kind of vaccination without serious injury, and was not farther tormented by cows or schoolmasters until he was about eight years old, when the family priest,—that is, we presume, the confessor of his parents,—taught him, agreeably to the Jesuit system, the rudiments of Greek and Latin concurrently. This priest was named Banister; and his name is frequently employed, together with other fictitious names, by way of signature to the notes in the *Dunciad*, an artifice which was adopted for the sake of giving a characteristic variety to the notes, according to the tone required for the illustration of the text. From his tuition Pope was at length dismissed to a Catholic school at Twyford, near Winchester. The selection of a school in this neighbourhood, though certainly the choice of a Catholic family was much limited, points apparently to the old Hampshire connection of his father. Here an incident occurred which most powerfully illustrates the original and constitutional determination to satire of this irritable poet. He knew himself so accurately that, in after times, half by way of boast, half of confession, he says,—

> "But touch me, and no Minister so sore:
> Whoe'er offends, at some unlucky time
> Slides into verse, and hitches in a rhyme,
> Sacred to ridicule his whole life long,
> And the sad burthen of some merry song."

Already, it seems, in childhood he had the same irresistible instinct, victorious over the strongest sense of personal danger. He wrote a bitter satire upon the presiding pedagogue, was brutally punished for this youthful indiscretion, and indignantly removed by his parents from the school. Mr Roscoe speaks of Pope's personal experience as necessarily unfavourable to public schools; but in reality he knew nothing of public schools. All the establishments for Papists were narrow, and suited to their political depression; and his parents were too sincerely anxious for their son's religious principles to risk the contagion of Protestant association by sending him elsewhere.

From the scene[3] of his disgrace and illiberal punishment, he passed, according to the received accounts, under the tuition of several other masters in rapid succession. But it is the less necessary to trouble the reader with their names, as Pope himself assures us that he learned nothing from any of them. To Banister he had been indebted for such trivial elements of a schoolboy's learning as he possessed at all, excepting those which he had taught himself. And upon himself it was, and his own admirable faculties, that he was now finally thrown for the rest of his education, at his age so immature that many boys are then first entering their academic career. Pope is supposed to have been scarcely twelve years old when he assumed the office of self-tuition, and bade farewell for ever to schools and tutors.

---

[1] It is apparently with allusion to this part of his history, which he would often have heard from the lips of his own father, that Pope glances at his uncle's memory somewhat disrespectfully in his prose letter to Lord Hervey.

[2] Some accounts, however, say to Flanders, in which case, perhaps, Antwerp or Brussels would have the honour of his conversion.

[3] This however was not Twyford, according to an anonymous pamphleteer of the times, but a Catholic seminary in Devonshire Street,—

Such a phenomenon is at any rate striking; it is the more so under the circumstances which attended the plan, and under the results which justified its execution. It seems, as regards the plan, hardly less strange that prudent parents should have acquiesced in a scheme of so much peril to his intellectual interests, than that the son, as regards the execution, should have justified their confidence by his final success. More especially this confidence surprises us in the father. A doating mother might shut her eyes to all remote evils in the present gratification to her affections; but Pope's father was a man of sense and principle; he must have weighed the risks besetting a boy left to his own intellectual guidance; and to these risks he would allow the more weight from his own conscious defect of scholarship and inability to guide or even to accompany his son's studies. He could neither direct the proper choice of studies, nor in any one study taken separately could he suggest the proper choice of books.

The case we apprehend to have been this: Alexander Pope the elder was a man of philosophical desires and unambitious character. Quiet and seclusion and innocence of life,—these were what he affected for himself; and that which had been found available for his own happiness, he might reasonably wish for his son. The two hinges upon which his plans may be supposed to have turned were, first, the political degradation of his sect; and, secondly, the fact that his son was an only child. Had he been a Protestant, or had he, though a Papist, been burdened with a large family of children, he would doubtless have pursued a different course. But to him, and, as he sincerely hoped, to his son, the strife after civil honours was sternly barred. Apostacy only could lay it open. And, as the sentiments of honour and duty in this point fell in with the vices of his temperament, high principle concurring with his constitutional love of ease, we need not wonder that he should early retire from commerce with a very moderate competence, or that he should suppose the same fortune sufficient for one who was to stand in the same position. The son was from his birth deformed. That made it probable that he might not marry. If he should, and happened to have children, a small family would find an adequate provision in the patrimonial funds; and a large one at the worst could only throw him upon the same commercial exertions to which he had been obliged himself. The Roman Catholics, indeed, were just then situated as our modern Quakers are: law to the one, as conscience to the other, closed all modes of active employment except that of commercial industry. Either his son, therefore, would be a rustic recluse, or, like himself, he would be a merchant.

With such prospects, what need of an elaborate education? And where was such an education to be sought? At the petty establishments of the suffering Catholics, the instruction, as he had found experimentally, was poor. At the great national establishments his son would be a degraded person; one who was permanently repelled from every arena of honour, and sometimes, as in cases of public danger, was banished from the capital, deprived of his house, left defenceless against common ruffians, and rendered liable to the control of every village magistrate. To one in these circumstances solitude was the wisest position; and the best qualification for that was an education that would furnish aids to solitary thought. No need for brilliant accomplishments to him who must never display them; forensic arts, pulpit erudition, senatorial eloquence, academical accomplishments,—these would be lost to one against whom the courts, the pulpit, the senate, the universities, were closed. Nay, by possibility worse than lost; they might prove so many snares or positive bribes to apostacy. Plain English, therefore, and the high thinking of his compatriot authors, might prove the best provision for the mind of an English Papist destined to seclusion.

Such are the considerations under which we read and

---

that is, in the Bloomsbury district of London; and the same author asserts that the scene of his disgrace, as indeed seems probable beforehand, was not the first but the last of his arenas as a schoolboy. Which indeed was first, and which last, is very unimportant; but with a view to another point, which is not without interest, namely, as to the motive of Pope for so bitter a lampoon as we must suppose it to have been, as well as with regard to the topics which he used to season it, this anonymous letter throws the only light which has been offered; and strange it is that no biographer of Pope should have hunted upon the traces indicated by him. Any solution of Pope's virulence, and of the master's bitter retaliation, even *as* a solution, is so far entitled to attention; apart from which the mere straightforwardness of this man's story, and its minute circumstantiality, weigh greatly in its favour. To our thinking he unfolds the whole affair in the simple explanation, nowhere else to be found, that the master of the school, the mean avenger of a childish insult by a bestial punishment, was a Mr Bromley, one of James II.'s Popish apostates; whilst the particular statements which he makes with respect to himself and the young Duke of Norfolk of 1700, as two schoolfellows of Pope at that time and place, together with his voluntary promise to come forward in person and verify his account if it should happen to be challenged;—are all, we repeat, so many presumptions in favour of his veracity. "Mr Alexander Pope," says he, "before he had been four months at this school, or was able to construe Tully's *Offices*, employed his muse in satirizing his master. It was a libel of at least one hundred verses, which (a fellow-student having given information of it) was found in his pocket; and the young satirist was soundly whipped, and kept a prisoner to his room for seven days; whereupon his father fetched him away, and I have been told he never went to school more." This Bromley, it has been ascertained, was the son of a country gentleman in Worcestershire, and must have had considerable prospects at one time, since it appears that he had been a gentleman-commoner at Christ's Church, Oxford. There is an error in the punctuation of the letter we have just quoted which affects the sense in a way very important to the question before us. Bromley is described as "one of King James's converts in Oxford, some years *after* that prince's abdication;" but if this were really so, he must have been a conscientious convert. The latter clause should be connected with what follows:—"*Some years after that prince's abdication he kept a little seminary;*" that is, when his mercenary views in quitting his religion were effectually defeated, when the Boyne had sealed his despair, he humbled himself into a petty schoolmaster. These facts are interesting, because they suggest at once the motive for the merciless punishment inflicted upon Pope. His own father was a Papist like Bromley, but a sincere and honest Papist, who had borne double taxes, legal stigmas, and public hatred for conscience sake. His contempt was habitually pointed at those who tampered with religion for interested purposes. His son inherited these upright feelings. And we may easily guess what would be the bitter sting of any satire he would write on Bromley. Such a topic was too true to be forgiven, and too keenly barbed by Bromley's conscience. By the way, this writer, like ourselves, reads in this juvenile adventure a prefiguration of Pope's satirical destiny. [The statement referred to (signed "E. P.," and published by Curll) is likely to have been one of Pope's stratagems to mislead Curll, and keep up the public interest in his own personal history.]

interpret the conduct of Pope's parents; and they lead us to regard as wise and conscientious a scheme which, under ordinary circumstances, would have been pitiably foolish. And be it remembered, that to these considerations, derived exclusively from the civil circumstances of the family, were superadded others derived from the astonishing prematurity of the individual. That boy who could write at twelve years of age the beautiful and touching stanzas on Solitude, might well be trusted with the superintendence of his own studies. And the stripling of sixteen, who could so far transcend in good sense the accomplished statesmen or men of the world with whom he afterwards corresponded, might challenge confidence for such a choice of books as would best promote the development of his own faculties.

In reality, one so finely endowed as Alexander Pope could not easily lose his way in the most extensive or ill-digested library. And though he tells Atterbury that at one time he abused his opportunities by reading controversial divinity, we may be sure that his own native activities, and the elasticity of his mind, would speedily recoil into a just equilibrium of study, under wider and happier opportunities. Reading, indeed, for a person like Pope, is rather valuable as a means of exciting his own energies, and of feeding his own sensibilities, than for any direct acquisitions of knowledge, or for any trains of systematic research. All men are destined to devour much rubbish between the cradle and the grave; and doubtless the man who is wisest in the choice of his books will have read many a page before he dies, that a thoughtful review would pronounce worthless. This is the fate of all men. But the reading of Pope, as a general result or measure of his judicious choice, is best justified in his writings. They show him well furnished with whatsoever he wanted for matter or for embellishment, or argument or illustration, for example and model, or for direct and explicit imitation.

Possibly, as we have already suggested, within the range of English literature Pope might have found all that he wanted. But variety the widest has its uses; and, for the extension of his influence with the polished classes amongst whom he lived, he did wisely to add other languages; and a question has thus arisen with regard to the extent of Pope's attainments as a self-taught linguist. A man, or even a boy, of great originality, may happen to succeed best in working his own native mines of thought, by his unassisted energies; here it is granted that a tutor, a guide, or even a companion, may be dispensed with, and even beneficially. But in the case of foreign languages, in attaining this machinery of literature, though anomalies even here do arise, and men there are, like Joseph Scaliger, who form their own dictionaries and grammars in the mere process of reading an unknown language, by far the major part of students will lose their time by rejecting the aid of tutors. As there has been much difference of opinion with regard to Pope's skill in languages, we shall briefly collate and bring into one focus the stray notices.

As to the French, Voltaire, who knew Pope personally, declared that he "could hardly *read* it, and spoke not one syllable of the language." But perhaps Voltaire might dislike Pope? On the contrary, he was acquainted with his works, and admired them to the very level of their merits. Speaking of him *after death* to Frederick of Prussia, he prefers him to Horace and Boileau, asserting that, by comparison with *them*,

> "Pope *approfondis* ce qu'ils ont *effleuré*.
> D'un esprit plus hardi, d'un pas plus assuré,
> Il porta le flambeau dans l'abîme de l'être;
> Et l'homme *avec lui seul* apprit à se connoître.
> L'art quelquefois, frivole, et quelquefois divine,
> L'art des vers est dans Pope utile au genre humain."

This is not a wise account of Pope, for it does not abstract the characteristic feature of his power; but it is a very kind one. And of course Voltaire could not have meant any unkindness in denying his knowledge of French. But he was certainly wrong. Pope, in *his* presence, would decline to speak or to read a language of which the pronunciation was confessedly beyond him. Or, if he did, the impression left would be still worse. In fact, no man ever will pronounce or talk a language which he does not use, for some part of every day, in the real intercourse of life. But that Pope read French of an ordinary cast with fluency enough, is evident from the extensive use which he made of Madame Dacier's labours on the *Iliad*, and still more of La Valterie's prose translation of the *Iliad*. Already in the year 1718, and long before his personal knowledge of Voltaire, Pope had shown his accurate acquaintance with some voluminous French authors in a way which, we suspect, was equally surprising and offensive to his noble correspondent. The Duke of Buckingham[1] had addressed to Pope a letter containing some account of the controversy about Homer which had then been recently carried on in France between La Motie and Madame Dacier. This account was delivered with an air of teaching which was very little in harmony with its excessive shallowness. Pope, who sustained the part of pupil in this interlude, replied in a manner that exhibited a knowledge of the parties concerned in the controversy much superior to that of the duke. In particular, he characterized the excellent notes upon Horace of M. Dacier the husband in very just terms, as distinguished from those of his conceited and half-learned wife; and the whole reply of Pope seems very much as though he had been playing off a mystification on his grace. Undoubtedly the pompous duke felt that he had caught a Tartar. Now, M. Dacier's *Horace*, which, with the text, fills nine volumes, Pope could not have read *except* in French; for they are not even yet translated into English. Besides, Pope read critically the French translation of his own *Essay on Man*, *Essay on Criticism*, *Rape of the Lock*, &c. He spoke of them as a critic; and it was at no time a fault of Pope's to make false pretensions. All readers of Pope's *Satires* must also recollect numerous proofs that he had read Boileau with so much feeling of his peculiar merit that he has appropriated and naturalized in English some of his best passages. Voltaire was therefore certainly wrong.

Of Italian literature, meantime, Pope knew little or nothing; and simply because he knew nothing of the language. Tasso, indeed, he admired; and, which is singular, more than Ariosto. But we believe that he had read him only in English; and it is certain that he could not take up an Italian author, either in prose or verse, for the unaffected amusement of his leisure.

Greek, we all know, has been denied to Pope, ever since he translated Homer, and chiefly in consequence of that translation. This seems at first sight unfair, because criticism has not succeeded in fixing upon Pope any errors of ignorance. His deviations from Homer were uniformly the result of imperfect sympathy with the naked simplicity of the antique, and therefore wilful deviations, not (like those of his more pretending competitors, Addison and Tickell) pure blunders of misapprehension. But yet it is not inconsistent with this concession to Pope's merits, that we must avow our belief in his thorough ignorance of Greek when he first commenced his task. And to us it seems astonishing that nobody should have adverted to that fact as a sufficient solution, and in fact the only plausible solution, of Pope's excessive depression of spirits in the earliest stage of his labours. This depression, after he had once pledged himself to his subscribers for the fulfilment of his task, arose from, and could have arisen from nothing else, than his conscious ignorance of Greek in connection with the solemn responsibilities he had assumed in the face of a great nation. Nay, even countries as presumptuously disdainful of tramontane literature as Italy took an interest in this memorable undertaking. Bishop Berkeley found Salvini reading it at Florence; and Madame Dacier even, who read little but Greek, and certainly no English until then, condescended to study it. Pope's dejection, therefore, or rather agitation (for it impressed by sympathy a tumultuous character upon his dreams which lasted for years after the cause had ceased to operate) was perfectly natural under the explanation we have given, but not otherwise. And how did he surmount this unhappy self-distrust? Paradoxical as it may sound, we will venture to say that, with the innumerable aids for interpreting Homer which even then existed, a man sufficiently acquainted with Latin might make a translation even critically exact. This Pope was not long in discovering. Other alleviations of his labour concurred, and in a ratio daily increasing.

---

[1] That is, Sheffield, and legally speaking, of Buckingham-*shire*. For he would not take the title of Buckingham, under a fear that there was lurking somewhere or other a claim to that title amongst the connections of the Villiers family. He was a pompous grandee, who lived in uneasy splendour, and, as a writer, most extravagantly overrated; accordingly he is now forgotten. Such was his vanity, and his ridiculous mania for allying himself with royalty, that he first of all had the presumption to court the Princess (afterwards Queen) Anne. Being rejected, he then offered himself to the illegitimate daughter of James II. by the daughter of Sir Charles Sedley. She was as ostentatious as himself, and accepted him.

The same formulæ were continually recurring, such as,

> "*But him answering, thus addressed the swift-footed Achilles;*"

Or,

> "*But him sternly beholding, thus spoke Agamemnon the king of men.*"

Then, again, universally the Homeric Greek, from many causes, is easy; and especially from these two: 1*st*, The simplicity of the thought, which never gathers into those perplexed knots of rhetorical condensation which we find in the dramatic poets of a higher civilization; 2*dly*, From the constant bounds set to the expansion of the thought by the form of the metre; an advantage of verse which makes the poets so much easier to a beginner in the German language than the illimitable weavers of prose. The line or the stanza reins up the poet tightly to his theme, and will not suffer him to expatiate. Gradually, therefore, Pope came to read the Homeric Greek, but never accurately; nor did he ever read Eustathius without aid from Latin. As to any knowledge of the Attic Greek, of the Greek of the dramatists, the Greek of Plato, the Greek of Demosthenes, Pope neither had it nor affected to have it. Indeed it was no foible of Pope's, as we will repeat, to make claims which he had not, or even to dwell ostentatiously upon those which he had. And with respect to Greek in particular, there is a manuscript letter in existence from Pope to a Mr Bridges at Falham which, speaking of the original Homer, distinctly records the knowledge which he had of his own "imperfectness in the language." Chapman, a most spirited translator of Homer, probably had no very critical skill in Greek; and Hobbes was, beyond all question, as poor a Grecian as he was a doggerel translator; yet in this letter Pope professes his willing submission to the "authority" of Chapman and Hobbes as superior to his own.

Finally, in *Latin* Pope was a "considerable proficient," even by the cautious testimony of Dr Johnson; and in this language only the doctor was an accomplished critic. If Pope had really the proficiency here ascribed to him, he must have had it already in his boyish years; for the translation from Statius, which is the principal monument of his skill, was executed *before* he was fourteen. We have taken the trouble to throw a hasty glance over it; and whilst we readily admit the extraordinary talent which it shows, as do all the juvenile essays of Pope, we cannot allow that it argues any accurate skill in Latin. The word Malĕa, as we have seen noticed by some editor, he makes Malēa; which in itself, as the name was not of common occurrence, would not have been an error worth noticing; but, taken in connection with the certainty that Pope had the original line before him—

> "Arripit ex templo Maleæ de valle resurgens,"

when not merely the scanning theoretically, but the whole rhythmus practically, to the most obtuse ear, would be annihilated by Pope's false quantity, is a blunder which serves to show his utter ignorance of prosody. But, even as a version of the sense, with every allowance for a poet's license of compression and expansion, Pope's translation is defective, and argues an occasional inability to construe the text. For instance, at the council summoned by Jupiter, it is said that he at his first entrance seats himself upon his starry throne, but not so the inferior gods:

> "Nec protinus ausi
> Cœlicolæ, veniam donec pater ipse sedendi
> Tranquilla jubet esse manu."

In which passage there is a slight obscurity, from the ellipsis of the word *sedere*, or *sese locare;* but the meaning is evidently that the other gods did not presume to sit down *protinus*, that is, in immediate succession to Jupiter, and interpreting his example as a tacit license to do so, until, by a gentle wave of his hand, the supreme father signifies his express permission to take their seats. But Pope, manifestly unable to extract any sense from the passage, translates thus:

> "At Jove's assent the deities around,
> In solemn state, the consistory *crown'd;*"

where at once the whole picturesque solemnity of the celestial ritual melts into the vaguest generalities. Again, at v. 178, *ruptæque vices* is translated "*and all the ties of nature broke;*" but by *vices* is indicated the alternate reign of the two brothers, as ratified by mutual oaths, and subsequently violated by Eteocles. Other mistakes might be cited, which seem to prove that Pope, like most self-taught linguists, was a very imperfect one.[1] Pope, in

---

[1] Meantime, the felicities of this translation are at times perfectly astonishing; and it would be scarcely possible to express more nervously or amply the words,

> "*Jurisque secundi*
> *Ambitus impatiens*, et summo dulcius unum
> Stare loco,"

than this child of fourteen has done in the following couplet, which, most judiciously, by reversing the two clauses, gains the power of fusing them into connection:

> "And impotent desire to reign alone,
> *That scorns the dull reversion of a throne.*"

But the passage for which, beyond all others, we must make room, is a series of eight lines, corresponding to six in the original, and this for two reasons: first, because Dr Joseph Warton has deliberately asserted, that in our whole literature "we have scarcely eight more beautiful lines than these;" and though few readers will subscribe to so sweeping a judgment, yet certainly these must be wonderful lines for a boy which could challenge such commendation from an experienced *polyhistor* of infinite reading. Secondly, because short, never rose to such a point in classical literature as to read either Greek or Latin authors without effort, and for his private amusement.

The result, therefore, of Pope's self-tuition appears to us, considered in the light of an attempt to acquire certain accomplishments of knowledge, a most complete failure. As a linguist, he read no language with ease; none with pleasure to himself; and none with so much accuracy as could have carried him through the most popular author with a general independence on interpreters. But, considered with a view to his particular faculties and slumbering originality of power, which required perhaps the stimulation of accident to arouse them effectually, we are very much disposed to think that the very failure of his education as an artificial training was a great advantage finally for inclining his mind to throw itself, by way of indemnification, upon its native powers. Had he attained, as with better tuition he would have attained, distinguished excellence as a scholar, or as a student of science, the chances are many that he would have settled down into such studies as thousands could pursue not less successfully than he; whilst as it was, the very dissatisfaction which he could not but feel with his slender attainments must have given him a strong motive for cultivating those impulses of original power which he felt continually stirring within him, and which were vivified into trials of competition as often as any distinguished excellence was introduced to his knowledge.

Pope's father, at the time of his birth, lived in Lombard Street;[1] a street still familiar to the public eye, from its adjacency to some of the chief metropolitan establishments, and to the English ear possessing a degree of historical importance; first, as the residence of those Lombards, or Milanese, who affiliated our infant commerce to the matron splendours of the Adriatic and the Mediterranean; next, as the central resort of those jewellers, or "goldsmiths," as they were styled, who performed all the functions of modern bankers from the period of the parliamentary war to the rise of the Bank of England, that is, for six years after the birth of Pope; and, lastly, as the seat, until lately, of that vast post-office through which, for so long a period, has passed the correspondence of all nations and languages, upon a scale unknown to any other country. In this street Alexander Pope the elder had a house, and a warehouse, we presume, annexed, in which he conducted the wholesale business of a linen merchant. As soon as he had made a moderate fortune he retired from business, first to Kensington, and afterwards to Binfield, in Windsor Forest. The period of this migration is not assigned by any writer. It is probable that a prudent man would not adopt it with any prospect of having more children. But this chance might be considered as already extinguished at the birth of Pope; for though his father had then only attained his forty-fourth year, Mrs Pope had completed her forty-eighth. It is probable, from the interval of seven days which is said to have elapsed between Pope's punishment and his removal from the school, that his parents were then living at such a distance from him as to prevent his ready communication with them, else we may be sure that Mrs Pope would have flown on the wings of love and wrath to the rescue of her darling. Supposing, therefore, as we *do* suppose, that Mr Bromley's school in London was the scene of his disgrace, it would appear on this argument that his parents were then living in Windsor Forest. And this hypothesis falls in with another anecdote in Pope's life, which we know partly upon his own authority. He tells Wycherly that he had seen Dryden, and barely seen him. *Virgilium vidi tantum.* This is presumed to have been in Will's coffee-house, whither any person in search of Dryden would of course resort; and it must have been before Pope was twelve years old, for Dryden died in 1700. Now there is a letter of Sir Charles Wogan's, stating that he first took Pope to Will's, and his words are, "from our forest." Consequently, at that period, when he had not completed his twelfth year, Pope was already living in the forest.

[Sir Charles Wogan says he had the honour of bringing Mr Pope from his retreat in the forest, to "dress *à la mode*, and introduce at Will's coffee-house." This cannot apply to a boy under twelve years of age, but must refer to a subsequent period.]

From this period, and so long as the genial spirits of youth lasted, Pope's life must have been one dream of pleasure. He tells Lord Hervey that his mother did not spoil him; but that was no doubt because there was no room for wilfulness or waywardness on either side, when all was one placid scene of parental obedience and gentle filial authority. We feel persuaded that, if not in words, in spirit and inclination they would, in any note they might have occasion to write, subscribe themselves "your dutiful parents." And of what consequence in whose hands were the reins which were never needed? Every reader must be pleased to know that these idolizing parents lived to see their son at the very summit of his public elevation; even his father lived two years and a half after the publication of his *Homer* had commenced, and when his fortune was made; and his mother lived for nearly eighteen years more. What a felicity for her, how rare and how perfect, to find that he, who to her maternal eyes was naturally the most perfect of human beings, and the idol of her heart, had already been the idol of the nation before he had completed his youth. She had also another blessing not always commanded by the most devoted love; many sons there are who think it essential to manliness that they should treat their mother's doating anxiety with levity, or even

---

the lines contain a night-scene. Now it must be well known to many readers, that the famous night-scene in the *Iliad*, so familiar to every school-boy, has been made the subject, for the last thirty years, of severe, and in many respects, of just criticism. This description will therefore have a double interest by comparison; whilst, whatever may be thought of either taken separately for itself, considered as a translation, this which we now quote is as true to Statius as the other is undoubtedly faithless to Homer:—

"*Jamque per emeriti surgens confinia Phœbi*
Titanis, late mundo subvecta silenti
Rorifera gelidum tenuaverat æra biga.
Jam pecudes volucresque tacent: jam somnus avaris
Inserpit curis, pronusque per æra nutat,
Grata laboratæ referens oblivia vitæ."
Theb. i. 336–341.

"'Twas now the time when Phœbus yields to night,
And rising Cynthia sheds her silver light;
Wide o'er the world in solemn pomp she drew
Her airy chariot hung with pearly dew.
All birds and beasts lie hushed. Sleep steals away
The wild desires of men and toils of day;
And brings, descending through the silent air,
A sweet forgetfulness of human care."

[1] One writer of that age says, in Cheapside; but probably this difference arose from contemplating Lombard Street as a prolongation of Cheapside. [He is first found residing in Broad Street. Mr Hotten, bookseller, Piccadilly, has published an extract from a London Directory of 1677, showing that in the list of merchants for that year was "Alexand. Pope, Broad-street." The *Athenæum* followed this up by a citation from the register of St Bennet-Fink, in which part of Broad Street is situated: "1679, 12 Aug. Buried, Magdalen, the wife of Alexander Pope." There can be no doubt that this Magdalen Pope was the wife of the poet's father, who had, previous to his removal to Lombard Street, resided in Broad Street during the period 1677–1679. The *Athenæum* further published an extract from the inedited correspondence of Pope with Mr Caryll, in which the poet writes—"My sister Rackett was my own father's daughter by a former wife." Of this first wife no information has been found.]

ridicule. But Pope, who was the model of a good son, never swerved in words, manners, or conduct, from the most respectful tenderness, or intermitted the piety of his attentions. And so far did he carry this regard for his mother's comfort, that, well knowing how she lived upon his presence or by his image, he denied himself for many years all excursions which could not be fully accomplished within the revolution of a week. And to this cause, combined with the excessive length of his mother's life, must be ascribed the fact that Pope never went abroad; not to Italy with Thomson or with Berkeley, or any of his diplomatic friends; not to Ireland, where his presence would have been hailed as a national honour; not even to France, on a visit to his admiring and admired friend Lord Bolingbroke. For as to the fear of sea-sickness *that* did not arise until a late period of his life; and at any period would not have operated to prevent his crossing from Dover to Calais. It is possible that, in his earlier and more sanguine years, all the perfection of his filial love may not have availed to prevent him from now and then breathing a secret murmur at confinement so constant. But it is certain that, long before he passed the meridian of his life, Pope had come to view this confinement with far other thoughts. Experience had then taught him that to no man is the privilege granted of possessing more than one or two friends who are such in extremity. By that time he had come to view his mother's death with fear and anguish. She, he knew by many a sign, would have been happy to lay down her life for his sake; but for others, even those who were the most friendly and the most constant in their attentions, he felt but too certainly that his death, or his heavy affliction, might cost them a few sighs, but would not materially disturb their peace of mind. "It is but in a very narrow circle," says he, in a confidential letter, "that friendship walks in this world, and I care not to tread out of it more than I needs must; knowing well it is but to two or three (if quite so many) that any man's welfare or memory can be of consequence." After such acknowledgments, we are not surprised to find him writing thus of his mother, and his fearful struggles to fight off the shock of his mother's death, at a time when it was rapidly approaching. After having said of a friend's death, "the subject is beyond writing upon, beyond cure or ease by reason or reflection, beyond all but one thought that it is the will of God," he goes on thus, "So will the death of my mother be, which now I tremble at, now resign to, now bring close to me, now set farther off; every day alters, turns me about, confuses my whole frame of mind." There is no pleasure, he adds, which the world can give, "equivalent to countervail either the death of one I have so long lived with, or of one I have so long lived for." How will he comfort himself after her death? "I have nothing left but to turn my thoughts to one comfort, the last we usually think of, though the only one we should in wisdom depend upon. I sit in her room, and she is always present before me but when I sleep. I wonder I am so well. I have shed many tears; but now I weep at nothing."

A man, therefore, happier than Pope in his domestic relations cannot easily have lived. It is true these relations were circumscribed; had they been wider they could not have been so happy. But Pope was equally fortunate in his social relations. What, indeed, most of all surprises us is the courteous, flattering, and even brilliant reception which Pope found from his earliest boyhood amongst the most accomplished men of the world. Wits, courtiers, statesmen, grandees the most dignified, and men of fashion the most brilliant, all alike treated him not only with pointed kindness, but with a respect that seemed to acknowledge him as their intellectual superior. Without rank, high birth, fortune, without even a literary name, and in defiance of a deformed person. Pope, whilst yet only sixteen years of age, was caressed, and even honoured; and all this with no one recommendation but simply the knowledge of his dedication to letters, and the premature expectations which he raised of future excellence. Sir William Trumbull, a veteran statesman, who had held the highest stations, both diplomatic and ministerial, made him his daily companion. Wycherley, the old *roué* of the town, a second-rate wit, but not the less jealous on that account, showed the utmost deference to one whom, as a man of fashion, he must have regarded with contempt, and between whom and himself there were nearly "fifty good years of fair and foul weather." Cromwell,[1] a fox-hunting country gentleman, but uniting with that character the pretensions of a wit, and affecting also the reputation of a rake, cultivated his regard with zeal and conscious inferiority. Nay, which never in any other instance happened to the most fortunate poet, his very inaugural essays in verse were treated, not as prelusive efforts of auspicious promise, but as finished works of art, entitled to take their station amongst the literature of the land; and in the most worthless of all his poems, Walsh, an established authority, and whom Dryden pronounced the ablest critic of the age, found proofs of equality with Virgil.

The literary correspondence with these gentlemen is interesting, as a model of what once passed for fine letter-writing. Every nerve was strained to outdo each other in carving all thoughts into a filigree work of rhetoric; and the amobean contest was like that between two village-cocks from neighbouring farms endeavouring to overcrow each other. To us, in this age of purer and more masculine taste, the whole scene takes the ludicrous air of old and young fops dancing a minuet with each other, practising the most elaborate grimaces, sinkings and risings the most awful, bows the most overshadowing, until plain walking, running, or the motions of natural dancing, are thought too insipid for endurance. In this instance the taste had perhaps really been borrowed from France though often enough we impute to France what is the native growth of all minds placed in similar circumstances. Madame de Sevigné's *Letters* were really models of grace. But Balzac, whose letters, however, are not without interest, had in some measure formed himself upon the truly magnificent rhetoric of Pliny and Seneca. Pope and his correspondents, meantime, degraded the dignity of rhetoric by applying it to trivial commonplaces of compliment; whereas Seneca applied it to the grandest themes which life or contemplation can supply. Lady Mary Wortley Montagu, on first coming amongst the wits of the day, naturally adopted their style. She found this sort of *euphuism* established;

---

[1] Dr Johnson said, that all he could discover about Mr Cromwell was the fact of his going a hunting in a tie-wig; but Gay has added another fact to Dr Johnson's, by calling him "honest *hatless* Cromwell with red breeches." This epithet has puzzled the commentators, but its import is obvious enough. Cromwell, as we learn from more than one person, was anxious to be considered a fine gentleman, and devoted to women. Now it was long the custom in that age for such persons, when walking with ladies, to carry their hats in their hand. Louis XV. used to ride by the side of Madame de Pompadour hat in hand. [Henry Cromwell was the son of a person of the same name resident in Ramsay, Huntingdonshire. He was related to the family of the Protector, the common ancestor of both being Sir Henry Cromwell of Hinchingbrook, the "Golden Knight" in Queen Elizabeth's days. The poet's friend had a small estate, Beesby in Lincolnshire. He died in London in 1728, aged 69. By his will he left his estate of Beesby to a second cousin, the Rev. Henry Greene, and L.40 a year to his "ancient and faithful servant" Isabel Perez, the "Lady Isabella" of Pope's letters. He directed also that his body should be decently interred, *suitable to his birth*, in the church of St Clement Danes, "which church," he adds, "I have most frequented."]

and it was not for a very young woman to oppose it. But her masculine understanding and powerful good sense, shaken free, besides, from all local follies by travels and extensive commerce with the world, first threw off these glittering chains of affectation. Dean Swift, by the very constitution of his mind, plain, sinewy, nervous, and courting only the strength that allies itself with homeliness, was always indisposed to this mode of correspondence. And, finally, Pope himself, as his earlier friends died off, and his own understanding acquired strength, laid it aside altogether. One reason doubtless was, that he found it too fatiguing; since in this way of letter-writing he was put to as much expense of wit in amusing an individual correspondent as would for an equal extent have sufficed to delight the whole world. A funambulist may harass his muscles and risk his neck on the tight-rope, but hardly to entertain his own family. Pope, however, had another reason for declining this showy system of fencing; and strange it is that he had not discovered this reason from the very first. As life advanced, it happened unavoidably that real business advanced; the careless condition of youth prompted no topics, or at least prescribed none, but such as were agreeable to the taste, and allowed of an ornamental colouring. But when downright business occurred, exchequer bills to be sold, meetings to be arranged, negotiations confided, difficulties to be explained, here and there by possibility a jest or two might be scattered, a witty allusion thrown in, or a sentiment interwoven; but for the main body of the case, it neither could receive any ornamental treatment, nor if, by any effort of ingenuity, it *had*, could it look otherwise than silly and unreasonable:—

> "Ornari res ipsa negat, contenta doceri."

Pope's idleness, therefore, on the one hand, concurring with good sense and the necessities of business on the other, drove him to quit his gay rhetoric in letter-writing. But there are passages surviving in his correspondence which indicate that, after all, had leisure and the coarse perplexities of life permitted it, he still looked with partiality upon his youthful style, and cherished it as a first love. But in this harsh world, as the course of true love, so that of rhetoric, never did run smooth; and thus it happened that, with a lingering farewell, he felt himself forced to bid it adieu. Strange that any man should think his own sincere and confidential overflowings of thought, and feeling upon books, men, and public affairs, less valuable in a literary view than the legerdemain of throwing up bubbles into the air for the sake of watching their prismatic hues, like an Indian juggler with his cups and balls. We of this age, who have formed our notions of epistolary excellence from the chastity of Gray's, the brilliancy of Lady Mary Wortley Montagu's during her later life, and the mingled good sense and fine feeling of Cowper's, value only those letters of Pope which he himself thought of inferior value. And even with regard to these, we may say that there is a great mistake made; the best of those later letters between Pope and Swift, &c., are not in themselves at all superior to the letters of sensible and accomplished women, such as leave every town in the island by every post. Their chief interest is a derivative one; we are pleased with any letter, good or bad, which relates to men of such eminent talent; and sometimes the subjects discussed have a separate interest for themselves. But as to the quality of the discussion, apart from the person discussing and the thing discussed, so trivial is the value of these letters in a large proportion, that we cannot but wonder at the preposterous value which was set upon them by the writers.[1] Pope especially ought not to have his ethereal works loaded by the mass of trivial prose which is usually attached to them.

This correspondence, meantime, with the wits of the time, though one mode by which, in the absence of reviews, the reputation of an author was spread, did not perhaps serve the interests of Pope so effectually as the poems which in this way he circulated in those classes of English society whose favour he chiefly courted. One of his friends, the truly kind and accomplished Sir William Trumbull, served him in that way, and perhaps in another eventually even more important. The library of Pope's father was composed exclusively of polemical divinity; a proof, by the way, that he was not a blind convert to the Roman Catholic faith, or, if he was so originally, had reviewed the grounds of it, and adhered to it after strenuous study. In this dearth of books at his own home, and until he was able to influence his father in buying more extensively, Pope had benefited by the loans of his friends; amongst whom it is probable that Sir William, as one of the best scholars of the whole, might assist him most. He certainly offered him the most touching compliment, as it was also the wisest and most paternal counsel, when he besought him, as one *goddess-born*, to quit the convivial society of deep-drinkers:

> "Heu, fuge nate dea, teque his, ait, eripe malis."

With these aids from friends of rank, and his way thus laid open to public favour, in the year 1709 Pope first came forward upon the stage of literature. The same year which terminated his legal minority introduced him to the public. *Miscellanies* in those days were almost periodical repositories of fugitive verse. Tonson happened at this time to be publishing one of some extent, the sixth volume of which offered a sort of ambush to the young aspirant of Windsor Forest, from which he might watch the public feeling. The volume was opened by Mr Ambrose Philips, in the character of pastoral poet; and in the same character, but stationed at the end of the volume, and thus covered by his bucolic leader, as a soldier to the rear by the file in advance, appeared Pope; so that he might win a little public notice, without too much seeming to challenge it. This half-clandestine emersion upon the stage of authorship, and his furtive position, are both mentioned by Pope as accidents, but as accidents in which he rejoiced, and not improbably accidents which Tonson had arranged with a view to his satisfaction. It must appear strange that Pope at twenty-one should choose to come forward for the first time with a work composed at sixteen. A difference of five years at that stage of life is of more effect than of twenty at a later; and his own expanding judgment could hardly fail to inform him that his *Pastorals* were by far the worst of his works. In reality, let us not deny, that had Pope never written anything else, his name would not have been known as a name even of promise, but would probably have been redeemed from oblivion by some satirist or writer of a *Dunciad*. Were a man to meet with such a nondescript monster as the following, viz.—"*Love out of Mount Ætna by a Whirlwind*," he would suppose himself reading the "Racing Calendar." Yet this hybrid creature is one of the many zoological monsters to whom the *Pastorals* introduce us:—

---

[1] It is strange indeed to find, not only that Pope had so frequently kept rough copies of his own letters, and that he thought so well of them as to repeat the same letter to different persons, as in the case of the two lovers killed by lightning, or even to two sisters, Martha and Therese Blount (who were sure to communicate their letters), but that even Swift had retained copies of *his*. [There is no instance of Pope repeating the same letter to the two sisters, Teresa (so she and all her friends wrote the name) and Martha Blount. For many years he wrote indifferently to either, but latterly he became estranged from Teresa (whom he accused of being too gay and fond of society), and his affection was concentrated on Martha, to whom he left the bulk of his fortune. She was of the same age as the poet, but survived till 1763. The connection was, as Mr De Quincey subsequently argues, of a purely innocent nature, although the poet's letters to the young ladies are occasionally stained by the grossness and pruriency of that licentious age.]

> "I know thee, love! on foreign mountains born,
> Wolves gave thee suck, and savage tigers fed.
> Thou wert from Ætna's burning entrails torn,
> Got by fierce whirlwinds, and in thunder born."

But the very names "Damon" and "Strephon," "Phillis" and "Delia," are rank with childishness. Arcadian life is at the best a feeble conception, and rests upon the false principle of crowding together all the luscious sweets of rural life, undignified by the danger which attends pastoral life in our climate, and unrelieved by shades, either moral or physical. And the Arcadia of Pope's age was the spurious Arcadia of the opera theatre, and, what is worse, of the French opera.

The hostilities which followed between these rival wooers of the pastoral muse are well known. Pope, irritated at what he conceived the partiality shown to Philips in the *Guardian*, pursued the review ironically; and, whilst affecting to load his antagonist with praises, draws into pointed relief some of his most flagrant faults. The result, however, we cannot believe. That all the wits, except Addison, were duped by the irony, is quite impossible. Could any man of sense mistake for praise the remark that Philips had imitated "*every* line of Strada;" that he had introduced wolves into England, and proved himself the first of gardeners by making his flowers "blow all in the same season?" Or, suppose those passages unnoticed, could the broad sneer escape him where Pope taxes the other writer (viz., himself) with having deviated "into downright poetry;" or the outrageous ridicule of Philips' style, as setting up for the ideal type of the pastoral style the quotation from Gay, beginning,

> "Rager, go vetch tha kee, or else tha zun
> Will quite bego before ch' 'avs half a don!"

Philips is said to have resented this treatment by threats of personal chastisement to Pope, and even hanging up a rod at Button's coffee-house. We may be certain that Philips never disgraced himself by such ignoble conduct.

[There is, however, good contemporary evidence for the fact. It is mentioned in a pamphlet, *Pope Alexander's Supremacy*, 1728; and in Cibber's Letter to Pope, 1742; and it is confirmed, Mr Peter Cunningham says, by an unpublished letter from Broome to Fenton, of 3d May 1729.]

If the public, indeed, were universally duped by the paper, what motive had Philips for resentment? Or, in any case, what plea had he for attacking Pope, who had not come forward as the author of the Essay? But, from Pope's confidential account of the matter, we know that Philips saw him daily, and never offered him "any indecorum;" though, for some cause or other, Pope pursued Philips with virulence through life.

In the year 1711 Pope published his *Essay on Criticism*, which some people have very unreasonably fancied his best performance; and in the same year his *Rape of the Lock*, the most exquisite monument of playful fancy that universal literature offers. It wanted, however, as yet, the principle of its vitality, in wanting the machinery of sylphs and gnomes, with which addition it was first published in 1714.

In the year 1712 (1715) Pope appeared again before the public as the author of the *Temple of Fame*, and the *Elegy to the Memory of an Unfortunate Lady*. Much speculation has arisen on the question concerning the name of this lady, and the more interesting question concerning the nature of the persecutions and misfortunes which she suffered. Pope appears purposely to decline answering the questions of his friends upon that point; at least the questions have reached us, and the answers have not. Joseph Warton supposed himself to have ascertained four facts about her: that her name was Wainsbury; that she was deformed in person; that she retired into a convent from some circumstances connected with an attachment to a young man of inferior rank; and that she killed herself, not by a sword, as the poet insinuates, but by a halter. As to the latter statement, it may very possibly be true; such a change would be a very slight exercise of the poet's privileges. As to the rest, there are scarcely grounds enough for an opinion. Pope certainly speaks of her under the name of Mrs (*i.e.*, Miss) W——, which at least argues a poetical exaggeration in describing her as a being "that once had *titles*, honour, wealth, and fame;" and he may as much have exaggerated her pretensions to beauty. It is indeed noticeable that he speaks simply of her *decent* limbs, which, in any English use of the word, does not imply much enthusiasm of praise. She appears to have been the niece of a Lady A——; and Mr Craggs, afterwards secretary of state [in reality Mr Caryll, not Craggs], wrote to Lady A—— on her behalf, and otherwise took an interest in her fate. As to her being a relative of the Duke of Buckingham's, that rests upon a mere conjectural interpretation applied to a letter of that nobleman's. But all things about this unhappy lady are as yet enveloped in mystery.

[The obscurity and confusion connected with Pope's *Elegy* had its origin primarily in a deceptive note in Warburton's edition of the poet's works, 1751. Appended to the Elegy we read:—"See the Duke of Buckingham's verses to a lady designing to retire into a monastery, compared with Mr Pope's 'Letters to several Ladies,' page 206. *She seems to be the same person whose unfortunate death is the subject of the poem.*—P." Turning to the "Letters to several Ladies" referred to, we find one of Pope's letters to Lady Mary Wortley Montagu. "We never meet," writes the poet, "but we lament over you. The Duke of B——m is sometimes the high priest of your praises." The name of Lady Mary was suppressed, and the reference to the Duke of B——m had misled Warburton, or was made by Pope for the purpose of mystification, in which he so much delighted. The duke's verses to a lady designing to retire into a monastery were first published in Tonson's *Miscellany* for 1709, when he was in his sixtieth year. They were most likely a much earlier production, and this renders it in the highest degree improbable that the same lady should have been commemorated by Pope, who was thirty-seven years younger than his friend. We are still without any positive information as to the name and history of the lady forming the subject of the Elegy. Walpole had learned it from Lady Hervey, but refused to communicate it; but from the intimacy that subsisted between Walpole and Warton, it has been conjectured that the latter had at length obtained from his friend the name Wainsbury, and the circumstances related above. Of this, however, we have no proof. The Elegy was first published, not in 1712, but in 1717. The "Mrs W." of the poet's printed correspondence was a Mrs Weston of Sutton, county of Surrey, niece of Lord Aston. She had separated from her husband, and Pope took a warm interest in her affairs. She survived till 1724, and died, not by the "visionary sword," or in a foreign land, but at her husband's residence of Sutton Place. See *Athenæum* for 1854, and Carruthers's *Life of Pope*, Bohn's "Illustrated Library."]

And not the least part of the mystery is a letter of Pope's to a Mr C——, bearing date 1732, that is, just twenty years after the publication of the poem, in which Pope, in a manly tone, justifies himself for his estrangement, and presses against his unknown correspondent the very blame which he had applied generally to the kinsman of the poor victim in 1712. Now, unless there is some mistake in the date, how are we to explain this gentleman's long lethargy, and his sudden sensibility to Pope's anathema, with which the world had resounded for twenty years?

[This refers to a totally different affair—to the case of a Mrs Cope, a distressed lady to whom Pope allowed L.20 a year. She was a relation of "Mr C.," or Caryll (who suggested the poem of the *Rape of the Lock*); and Pope, though generous to the lady, was unjust towards her relative Mr Caryll, by the manner in which he garbled the correspondence in his printed letters.]

Pope had now established his reputation with the public as the legitimate successor and heir to the poetical supremacy of Dryden. His *Rape of the Lock* was unrivalled in ancient or modern literature, and the time had now arrived when, instead of seeking to extend his fame, he might count upon a pretty general support in applying what he had already established to the promotion of his own interest. Accordingly, in the autumn of 1713, he formed a final resolution of undertaking a new translation of the *Iliad.* It must be observed that already in 1709, concurrently with his Pastorals, he had published specimens of such a translation; and these had been communicated to his friends some time before. In particular, Sir William Trumbull, on the 9th of April 1708, urged upon Pope a complete translation of both *Iliad* and *Odyssey.* Defective skill in the Greek language, exaggeration of the difficulties, and the timidity of a writer as yet unknown, and not quite twenty years old, restrained Pope for five years and more. What he had practised as a sort of *bravura*, for a single effort of display, he recoiled from as a daily task to be pursued through much toil, and a considerable section of his life. However, he dallied with the purpose, starting difficulties in the temper of one who wishes to hear them undervalued; until at length Sir Richard Steele determined him to the undertaking, a fact overlooked by the biographers, but which is ascertained by Ayre's account of that interview between Pope and Addison, probably in 1716, which sealed the rupture between them. [This supposed interview is now believed to be apocryphal.] In the autumn of 1713, he made his design known amongst his friends. Accordingly, on the 21st of October, we have Lord Landsdowne's letter, expressing his great pleasure at the communication; on the 26th, we have Addison's letter encouraging him to the task; and in November of the same year occurs the amusing scene so graphically described by Bishop Kennet, when Dean Swift presided in the conversation, and, amongst other indications of his conscious authority, "instructed a young nobleman that the best poet in England was Mr Pope, who had *begun* a translation of Homer into English verse, for which he must have them all subscribe; for," says he, "*the author shall not begin to print until I have a thousand guineas for him.*"

If this were the extent of what Swift anticipated from the work, he fell miserably below the result. But, perhaps, he spoke only of a cautionary *arrha* or earnest. As this was unquestionably the greatest literary labour, as to profit, ever executed, not excepting the most lucrative of Sir Walter Scott's, if due allowance be made for the altered value of money, and if we consider the *Odyssey* as forming part of the labour, it may be right to state the particulars of Pope's contract with Lintot.

The number of subscribers to the *Iliad* was 575, and the number of copies subscribed for was 654. The work was to be printed in six quarto volumes, and the subscription was a guinea a volume. Consequently by the subscription Pope obtained six times 654 guineas, or L.4218, 6s. (for the guinea then passed for 21s. 6d.); and for the copyright of each volume Lintot offered L.200, consequently L.1200 for the whole six; so that from the *Iliad* the profit exactly amounted to L.5310, 16s. Of the *Odyssey*, 574 copies were subscribed for. It was to be printed in five quarto volumes, and the subscription was a guinea a volume. Consequently by the subscription Pope obtained five times 574 guineas, or L.3085, 5s.; and for the copyright Lintot offered L.600. The total sum received therefore by Pope, on account of the *Odyssey*, was L.3685, 5s. But in this instance he had two coadjutors, Broome and Fenton; between them they translated twelve books, leaving twelve to Pope. The notes also were compiled by Broome; but the postscript to the notes was written by Pope. Fenton received L.300, Broome L.500. Such, at least, is Warton's account, and more probable than that of Ruffhead, who not only varies the proportions, but increases the whole sum given to the assistants by L.100. Thus far we had followed the guidance of mere probabilities, as they lie upon the face of the transaction. But we have since detected a written statement of Pope's, unaccountably overlooked by the biographers, and serving of itself to show how negligently they have read the works of their illustrious subject. The statement is entitled to the fullest attention and confidence, not being a hasty or casual notice of the transaction, but pointedly shaped to meet a calumnious rumour against Pope in his character of paymaster; as if he who had found so much liberality from publishers in his own person, were niggardly or unjust as soon as he assumed those relations to others. Broome, it was alleged, had expressed himself dissatisfied with Pope's remuneration. Perhaps he had; for he would be likely to frame his estimate for his own services from the scale of Pope's reputed gains; and those gains would, at any rate, be enormously exaggerated, as uniformly happens where there is a basis of the marvellous to begin with. And, secondly, it would be natural enough to assume the previous result from the *Iliad* as a fair standard for computation; but in this, as we know, all parties found themselves disappointed, and Broome had the less right to murmur at this, since the arrangement with himself as chief journeyman in the job was one main cause of the disappointment. There was also another reason why Broome should be less satisfied than Fenton. Verse for verse, any one thousand lines of a translation so purely mechanical might stand against any other thousand; and so far the equation of claims was easy. A book-keeper, with a pen behind his ear, and Cocker's *Golden Rule* open before him, could do full justice to Mr Broome *as a poet* every Saturday night. But Broome had a separate account-current for pure prose against Pope. One he had in conjunction with Fenton for verses delivered on the premises at so much per hundred, on which there could be no demur, except as to the allowance for tare and tret as a discount in favour of Pope. But the prose account, the account for notes, requiring very various degrees of reading and research, allowed of no such easy equation. *There* it was, we conceive, that Broome's discontent arose. Pope, however, declares that he had given him L.500, thus confirming the proportions of Warton against Ruffhead (that is, in effect, Warburton), and some other advantages which were not in money, nor deductions at all from his own money profits, but which may have been worth so much money to Broome as to give some colourable truth to Ruffhead's allegation of an additional L.100. In direct money, it remains certain that Fenton had three and Broome five hundred pounds.

[Spence says Fenton received L.240. Broome, in an inedited letter quoted by Mr P. Cunningham in his edition of Johnson's *Lives*, writes to Pope, Oct. 29, 1735:—"You paid me L.500; that is, L.100 for the notes and L.400 for eight books of the prose translation, and Mr Fenton in proportion for his four books." Broome was probably also dissatisfied with the manner in which Pope referred to his coadjutors at the conclusion of the notes to the *Odyssey*. *Five* books only are mentioned as the work of Broome and Fenton, while in reality they translated *twelve* books. Warburton told Johnson, "in his warm language," that "he thought the relation given in the note a lie;" and such it appears to have been.]

It follows, therefore, that for the *Iliad* and *Odyssey* jointly he received a sum of L.8996, 1s., and paid for assistance L.800, which leaves to himself a clear sum of L.8196, 1s. And, in fact, his profits ought to be calculated without deduction, since it was his own choice, from indolence, to purchase assistance.

The *Iliad* was commenced about October 1713. In the summer of the following year he was so far advanced as to begin making arrangements with Lintot for the printing; and the first two books, in manuscript, were put into the hands of Lord Halifax. In June 1715, between the 10th and 28th, the subscribers received their copies of the first volume; and in July Lintot began to publish that volume generally. Some readers will inquire, who paid for the printing and paper, &c.? All this expense fell upon Lintot, for whom Pope was superfluously anxious. The sagacious bookseller understood what he was about; and, when a pirated edition was published in Holland, he counteracted the injury by printing a cheap edition, of which 7500 copies were sold in a few weeks; an extraordinary proof of the extended interest in literature. The second, third, and fourth volumes of the *Iliad*, each containing, like the first, four books, were published successively in 1716, 1717, 1718; and in 1720 Pope completed the work by publishing the fifth volume, containing five books, and the sixth, containing the last three, with the requisite supplementary apparatus.

The *Odyssey* was commenced in 1723 (not 1722, as Mr Roscoe virtually asserts at p. 259), and the publication of it was finished in 1725. The sale, however, was much inferior to that of the *Iliad*, for which more reasons than one might be assigned. But there can be no doubt that Pope himself depreciated the work, by his undignified arrangements for working by subordinate hands. Such a process may answer in sculpture, because there a quantity of rough-hewing occurs, which can no more be improved by committing it to a Phidias, than a common shop-bill could be improved in its arithmetic by Sir Isaac Newton. But in literature such arrangements are degrading; and, above all, in a work which was but too much exposed already to the presumption of being a mere effort of mechanic skill, or (as Curll said to the House of Lords) "*a knack*;" it was deliberately helping forward that idea to let off parts of the labour. Only think of Milton letting off by contract to the lowest offer, and to be delivered by such a day (for which good security to be found), six books of *Paradise Lost*. It is true, the great dramatic authors were often *collaborateurs*, but their case was essentially different. The loss, however, fell not upon Pope, but upon Lintot, who, on this occasion, was out of temper, and talked rather broadly of prosecution. But that was out of the question. Pope had acted indiscreetly, but nothing could be alleged against his honour; for he had expressly warned the public that he did not, as in the other case, profess to translate, but to *undertake*[1] a translation of the *Odyssey*. Lintot, however, was no loser absolutely, though he might be so in relation to his expectations; on the contrary, he grew rich, bought land, and became sheriff of the county in which his estates lay.

We have pursued the Homeric labours uninterruptedly from their commencement in 1713 till their final termination in 1725, a period of twelve years or nearly; because this was the task to which Pope owed the dignity, if not the comforts, of his life, since it was this which enabled him to decline a pension from all administrations, and even from his friend Craggs, the secretary, to decline the express offer of L.300 per annum. Indeed, Pope is always proud to own his obligations to Homer. In the interval, however, between the *Iliad* and the *Odyssey*, Pope listened to proposals made by Jacob Tonson that he should revise an edition of Shakspeare. For this, which was in fact the first attempt at establishing the text of the mighty poet, Pope obtained but little money, and still less reputation. He received, according to tradition, only L.217, 12s. for his trouble of collation, which must have been considerable, and some other trifling editorial labour. And the opinion of all judges, from the first so unfavourable as to have depreciated the money value of the book enormously, perhaps from a prepossession of the public mind against the fitness of Pope for executing the dull labours of revision, has ever since pronounced this work the very worst edition in existence. For the edition we have little to plead; but for the editor it is but just to make three apologies. In the *first* place, he wrote a brilliant preface, which, although (like other works of the same class) too much occupied in displaying his own ability, and too often, for the sake of an effective antithesis, doing deep injustice to Shakspeare, yet undoubtedly, as a whole, extended his fame, by giving the sanction and countersign of a great wit to the national admiration. *Secondly*, as Dr Johnson admits, Pope's failure pointed out the right road to his successors. *Thirdly*, even in this failure it is but fair to say, that in a graduated scale of merit, as distributed amongst the long succession of editors through that century, Pope holds a rank proportionable to his age. For the year 1720, he is no otherwise below Theobald, Hanmer, Capell, Warburton, or even Johnson, than as they are successively below each other, and all of them as to accuracy below Steevens, as he again was below Malone and Read.

The gains from Shakspeare would hardly counterbalance the loss which Pope sustained this year from the South Sea bubble. One thing, by the way, is still unaccountably neglected by writers on this question: how it was that the great Mississippi bubble, during the Orleans regency in Paris, should have happened to coincide with that of London. If this were accident, how marvellous that the same insanity should possess the two great capitals of Christendom in the same year? If, again, it were not accident, but due to some common cause, why is not that cause explained? Pope to his nearest friends never stated the amount of his loss. The biographers report that at one time his stock was worth from twenty to thirty thousand pounds. But that is quite impossible. It is true that, as the stock rose at one time a thousand per cent., this would not imply on Pope's part an original purchase beyond twenty-five hundred pounds or thereabouts. But Pope has furnished an argument against *that*, which we shall improve. He quotes more than once, as applicable to his own case, the old proverbial riddle of Hesiod, πλεον ἥμισυ παντος (*the half is more than the whole*). What did he mean by that? We understand it thus: that between the selling and buying, the variations had been such as to sink his shares to one-half of the price they had once reached, but, even at that depreciation, to leave him richer on selling out than he had been at first. But the half of L.25,000 would be a far larger sum than Pope could have ventured to risk upon a fund confessedly liable to daily fluctuation. L.3000 would be the utmost he could risk; in which case the half of L.25,000 would have left him so very much richer that he would have proclaimed his good fortune as an evidence of his skill and prudence. Yet, on the contrary, he wished his friends to understand at times that he had lost. But his friends forgot to ask one important question: Was the word *loss* to be understood in relation to the imaginary and nominal wealth which he once possessed, or in relation to the absolute sum invested in the South Sea fund? The truth is, Pope practised on this, as on other occasions, a little finessing, which is the chief foible in his character. His object was that, according to circumstances, he might vindicate his own freedom from the common mania, in case his enemies should take that handle for attacking him; or might have it in his power to plead poverty, and to account for it, in case he should ever accept that pension which had been so often tendered, but never sternly rejected.

---

[1] The word *undertake* had not yet lost the meaning of Shakspeare's age, in which it was understood to describe those cases where, the labour being of a miscellaneous kind, some person in chief offered to overlook and conduct the whole, whether with or without personal labour. The modern *undertaker*, limited to the care of funerals. was then but one of numerous cases to which the term was applied.

In 1723 Pope lost one of his dearest friends, Bishop Atterbury, by banishment; a sentence most justly incurred, and mercifully mitigated by the hostile Whig government. On the bishop's trial, a circumstance occurred to Pope which flagrantly corroborated his own belief in his natural disqualification for public life. He was summoned as an evidence on his friend's behalf. He had but a dozen words to say, simply explaining the general tenor of his lordship's behaviour at Bromley; and yet, under this trivial task, though supported by the enthusiasm of his friendship, he broke down. Lord Bolingbroke, returning from exile, met the bishop at the sea-side; upon which it was wittily remarked that they were "exchanged." Lord Bolingbroke supplied to Pope the place, or perhaps more than supplied the place, of the friend he had lost; for Bolingbroke was a freethinker, and so far more entertaining to Pope, even whilst partially dissenting, than Atterbury, whose clerical profession laid him under restraints of decorum, and latterly, there is reason to think, of conscience.

In 1725, on closing the *Odyssey*, Pope announces his intention to Swift of quitting the labours of a translator, and thenceforwards applying himself to original composition. This resolution led to the *Essay on Man*, which appeared soon afterwards; and, with the exception of two labours, which occupied Pope in the interval between 1726 and 1729, the rest of his life may properly be described as dedicated to the further extension of that Essay. The two works which he interposed were a collection of the fugitive papers, whether prose or verse, which he and Dean Swift had scattered amongst their friends at different periods of life. The avowed motive for this publication, and in fact the secret motive, as disclosed in Pope's confidential letters, was to make it impossible thenceforwards for piratical publishers like Curll. Both Pope and Swift dreaded the malice of Curll in case they should die before him. It was one of Curll's regular artifices to publish a heap of trash on the death of any eminent man, under the title of his *Remains;* and in allusion to that practice it was that Arbuthnot most wittily called Curll "one of the new terrors of death." By publishing *all*, Pope would have disarmed Curll beforehand; and *that* was in fact the purpose; and that plea only could be offered by two grave authors, one forty, the other sixty years old, for reprinting *jeux d'esprit* that never had any other apology than the youth of their authors. Yet, strange to say, after all, some were omitted; and the omission of one opened the door to Curll as well as that of a score. Let Curll have once inserted the narrow end of the wedge, he would soon have driven it home.

This *Miscellany*, however, in three volumes (published in 1727, but afterwards increased by a fourth in 1732), though in itself a trifling work, had one vast consequence. It drew after it swarms of libels and lampoons, levelled almost exclusively at Pope, although the cipher of the joint authors stood entwined upon the title-page. These libels in *their* turn produced a second re-action; and, by stimulating Pope to effectual anger, eventually drew forth, for the everlasting admiration of posterity, the very greatest of Pope's works,—a monument of satirical power the greatest which man has produced, not excepting the *MacFleckno* of Dryden, namely, the immortal *Dunciad*.

In October of the year 1727 this poem, in its original form, was completed. Many editions, not spurious altogether, nor surreptitious, but with some connivance, not yet explained, from Pope, were printed in Dublin and in London. But the first quarto and acknowledged edition was published in London early in "1728–9," as the editors choose to write it, that is (without perplexing the reader), in 1729; on March 12 of which year it was presented by the prime minister, Sir Robert Walpole, to the king and queen at St James's.

[The "War of the Dunces" was one of the grand topics of the day. It commenced with the publication of the *Miscellanies*, in which Gay and Arbuthnot, as well as Pope and Swift, were joint authors. The two first volumes of the *Miscellanies* were published in June 1727, the third volume in March 1728. In this last volume appeared Pope's treatise on the Bathos, in which a host of minor poets (including Broome, Aaron Hill, Dennis, Gildon, James Moore Smythe, Welsted, &c.) were satirized. Some of the parties assailed made a feeble attempt at retaliation; but Pope was ready and eager for the strife. Within three months (May 1728) he issued the first edition of the *Dunciad;* and in other ten days appeared *A Key to the Dunciad*, ludicrously fathered upon Sir Richard Blackmore, but evidently the production of the poet. He wrote, also anonymously, various letters in the newspapers, keeping up the public attention to his work. In the preface to the first imperfect *Dunciad*, Pope had hinted at a complete copy of the poem; and accordingly, in April 1729, the enlarged edition, with Notes Variorum, Prolegomena, &c., was published. He wrote a humorous account of the reception of his satire, to which the name of Savage was affixed, and also a clever sarcastic production entitled *An Author to Let*, which also appeared with the name of Savage as author. About the same time Pope contributed a series of epigrams, letters, and criticisms to the *Grub Street Journal*, though he strenuously denied all connection with the paper. It is probable we are only yet half informed of the poet's underground labours, but it is certain that, if one of the most irritable of the tribe of authors, he was no less one of the most indefatigable and unscrupulous.]

Like a hornet, who is said to leave his sting in the wound, and afterwards to languish away, Pope felt so greatly exhausted by the efforts connected with the *Dunciad* (which are far greater, in fact, than all his Homeric labours put together), that he prepared his friends to expect for the future only an indolent companion and a hermit. Events rapidly succeeded which tended to strengthen the impression he had conceived of his own decay, and certainly to increase his disgust with the world. In 1732 died his friend Atterbury; and on December the 7th of the same year Gay, the most unpretending of all the wits whom he knew, and the one with whom he had at one time been domesticated, expired, after an illness of three days, which Dr Arbuthnot declares to have been "the most precipitate" he ever knew. But in fact Gay had long been decaying from the ignoble vice of too much and too luxurious eating. Six months after this loss, which greatly affected Pope, came the last deadly wound which this life could inflict, in the death of his mother. She had for some time been in her dotage, and recognised no face but that of her son, so that her death was not unexpected; but that circumstance did not soften the blow of separation to Pope. She died on the 7th of June 1733, being then ninety-three years old [more probably ninety-one]. Three days after, writing to Richardson the painter, for the purpose of urging him to come down and take her portrait before the coffin was closed, he says, "I thank God her death was as easy as her life was innocent; and as it cost her not a groan nor even a sigh, there is yet upon her countenance such an expression of tranquillity" that "it would afford the finest image of a saint expired that ever painting drew. Adieu, may you die as happily." The funeral took place on the 11th; Pope then quitted the house, unable to support the silence of her chamber, and did not return for months, nor in fact ever reconciled himself to the sight of her vacant apartment.

Swift also he had virtually lost for ever. In April 1727 this unhappy man had visited Pope for the last time. During this visit occurred the death of George I. Great expectations arose from that event amongst the Tories, in which, of course, Swift shared. It was reckoned upon as a thing of course that Walpole would be dismissed. But this bright gleam of hope proved as treacherous as all before; and the anguish of this final disappointment perhaps it was which brought on a violent attack of Swift's constitutional malady. On the last of August he quitted Pope's house abruptly; concealed himself in London; and finally quitted it, as stealthily as he had before quitted Twickenham, for

Ireland, never more to return. He left a most affectionate letter for Pope; but his affliction, and his gloomy anticipations of insanity, were too oppressive to allow of his seeking a personal interview.

Pope might now describe himself pretty nearly as *ultimus suorum;* and if he would have friends in future, he must seek them, as he complains bitterly, almost amongst strangers and another generation. This sense of desolation may account for the acrimony which too much disfigures his writings henceforward. Between 1732 and 1740 he was chiefly engaged in satires, which uniformly speak a high moral tone in the midst of personal invective; or in poems directly philosophical, which almost as uniformly speak the bitter tone of satire in the midst of dispassionate ethics. His *Essay on Man* was but one link in a general course which he had projected of moral philosophy, here and there pursuing his themes into the fields of metaphysics, but no farther in either field of morals or metaphysics than he could make compatible with a poetical treatment. These works, however, naturally entangled him in feuds of various complexions with people of very various pretensions; and to admirers of Pope so fervent as we profess ourselves, it is painful to acknowledge that the dignity of his latter years, and the becoming tranquillity of increasing age, are sadly disturbed by the petulance and the tone of irritation which, alike to those in the wrong and in the right, inevitably besiege all personal disputes. He was agitated besides by a piratical publication of his correspondence. This emanated of course from the den of Curll, the universal robber and "*blatant beast*" of those days; and besides the injury offered to his feelings by exposing some youthful sallies which he wished to have suppressed, it drew upon him a far more disgraceful imputation, most assuredly unfounded, but accredited by Dr Johnson, and consequently in full currency to this day, of having acted collusively with Curll, or at least through Curll, for the publication of what he wished the world to see, but could not else have devised any decent pretext for exhibiting.

[This opinion, clearly and emphatically stated by Johnson, has now obtained almost universal assent. We must refer to Johnson's *Life of Pope* for an account of the dramatic incidents connected with the sale and delivery of the printed correspondence to Curll. Pope denounced the letters so published as surreptitious, incorrect, and interpolated; and he felt himself under the necessity, he said, of issuing a genuine edition. This genuine edition, however, is substantially the same as the so-called surreptitious copy, and both differ widely from the original letters as existing in manuscript. Names and dates were omitted, or imperfectly and confusedly indicated. Mr Caryll is in one place "The Hon. J. C., Esq.," in another "The Hon. ——," and in a third "Mr C——." Events are placed under wrong dates, and incidents are transposed, added, or left out, at the caprice or pleasure of the editor. The language is in most of them revised and re-touched. Now this is the case equally in Curll's and in Pope's own edition; and the conclusion is irresistible, that both were prepared by Pope. Amanuenses, he said, were employed in making copies of his letters for Lord Oxford's library, and he hinted at stolen copies, but no amanuensis was brought forward, and no evidence adduced in support of the improbable charge. It has lately (*Athenæum*, 1854) been proved that Pope carried the manufacture of correspondence much farther than Johnson supposed. He printed letters as addressed to Addison, Arbuthnot, and Trumbull, which had previously been written and sent to his friend Caryll; thus dressing up the copies of his early epistles as a mere literary manufacture. He evidently regarded the whole as part of his literature; part of his works; the same as his poetry, with which he could deal at pleasure. To some letters he affixed great names, that he might render the correspondence attractive, and elevate his own social importance; while others were framed to suit some personal object, to carry out enmities or commemorate friendships. In all of them the poet himself was seen to advantage. This double dealing, as it must be termed, and the unreal character of the correspondence, render it almost impossible to judge between Pope and Addison in the quarrel or misunderstanding that divided them (of which we know nothing but from Pope), and from the same cause many circumstances in the poet's early career are doubtful. As literary productions, we should be inclined to value Pope's letters more highly than Mr De Quincey estimates them. They have exquisite passages of description, humour, and sentiment. The genuine correspondence of Swift and Bolingbroke came afterwards (it was fortunate that Swift did not deliver up to Pope the letters in his possession), and thus the collection was made an important and delightful—indeed inimitable—addition to our literature.]

The disturbance of his mind on this occasion led to a circular request, dispersed amongst his friends, that they would return his letters. All complied except Swift. He only delayed, and in fact shuffled. But it is easy to read in his evasions, and Pope, in spite of his vexation, read the same tale, viz., that in consequence of his recurring attacks and increasing misery, he was himself the victim of artifices amongst those who surrounded him. What Pope apprehended happened. The letters were all published in Dublin and in London, the originals being then only returned when they had done their work of exposure.

Such a tenor of life, so constantly fretted by petty wrongs or by leaden insults, to which only the celebrity of their object lent force or wings, allowed little opportunity to Pope for recalling his powers from angry themes, and converging them upon others of more catholic philosophy. To the last he continued to conceal vipers beneath his flowers; or rather, speaking proportionately to the case, he continued to sheath amongst the gleaming but innocuous lightnings of his departing splendours the thunderbolts which blasted for ever. His last appearance was his greatest. In 1742 he published the fourth book of the *Dunciad;* to which it has with much reason been objected, that it stands in no obvious relation to the other three, but which, taken as a separate whole, is by far the most brilliant and the weightiest of his works. Pope was aware of the *hiatus* between this last book and the rest, on which account he sometimes called it the greater *Dunciad;* and it would have been easy for him, with a shallow Warburtonian ingenuity, to invent links that might have satisfied a mere *verbal* sense of connection. But he disdained this puerile expedient. The fact was, and could not be disguised from any penetrating eye, that the poem was not a pursuit of the former subjects; it had arisen spontaneously at various times, by looking at the same general theme of dulness (which, in Pope's sense, includes all aberrations of the intellect, nay, even any defective equilibrium amongst the faculties) under a different angle of observation, and from a different centre. In this closing book, not only bad authors, as in the other three, but all abuses of science or antiquarian knowledge, or connoisseurship in the arts, are attacked: virtuosi, medalists, butterfly-hunters, florists, erring metaphysicians, &c., are all pierced through and through as with the shafts of Apollo. But the imperfect plan of the work as to its internal economy, no less than its exterior relations, is evident in many places; and in particular the whole catastrophe of the poem, if it can be so called, is linked to the rest by a most insufficient incident. To give a closing grandeur to his work, Pope had conceived the idea of representing the earth as lying universally under the incubation of one mighty spirit of dulness; a sort of millenium, as we may call it, for ignorance, error, and stupidity. This would take leave of the reader with effect; but how was it to be introduced? at what era? under what exciting cause? As to the eras, Pope could not settle that; unless it were a *future* era, the description of it could not be delivered as a prophecy; and not being prophetic, it would want much of its grandeur. Yet, *as* a part of futurity, how is it connected with our present times? Do they and their pursuits lead to it as a possibility, or as a contingency upon certain habits which we have it in our power to eradicate (in which case this vision of dulness has a *practical* warning), or is it a mere necessity, one amongst the many changes attached to the cycles of human destiny, or which chance brings round with the revolutions of its wheel? All this Pope could not determine; but the exciting cause he *has* determined, and it is preposterously below the effect. The goddess of dulness yawns; and her yawn, which, after all, should rather express the fact and state of universal dulness than its cause, produces a change over all nations tantamount to a long eclipse. Meantime, with all its defects of plan, the poem, as to execution, is superior to all which Pope has done; the composition is much superior to that of the *Essay on Man*, and more profoundly poetic: the parodies drawn from Milton, as also in the former books, have a beauty and effect which cannot be expressed; and if a young lady wished to cull for her album a passage from all Pope's writings, which, without a trace of irritation or acrimony, should yet present an exquisite gem of independent beauty, she could not find another passage equal to the little story of the florist and the butterfly-hunter. They plead their cause separately before the throne of dulness, the florist telling how he had reared a superb carnation, which, in honour of the queen, he called Caroline, when his enemy, pursuing a butterfly which settled on the carnation, in securing his own object, had destroyed that of the plaintiff. The defendant replies with equal beauty; and it may certainly be affirmed, that for brilliancy of colouring and the art of poetical narration, the tale is not surpassed by any in the language.

This was the last effort of Pope worthy of separate notice. He was now decaying rapidly, and sensible of his own decay. His complaint was a dropsy of the chest, and he knew it to be incurable. Under these circumstances, his behaviour was admirably philosophical. He employed himself in revising and burnishing all his later works, as those upon which he wisely relied for his reputation with future generations. In this task he was assisted by Dr Warburton, a new literary friend, who had introduced himself to the favourable notice of Pope about four years before, by a defence of the *Essay on Man* which Crousaz had attacked, but in general indirectly and ineffectually, by attacking it through the blunders of a very faulty translation. This poem, however, still labours, to religious readers, under two capital defects. If man, according to Pope, is now so admirably placed in the universal system of things, that evil only could result from any change, then it seems to follow either that a fall of man is inadmissible, or at least that, by placing him in his true centre, it had been a blessing universally. The other objection lies in this, that if all is right already, and in this earthly station, then one argument for a future state, as the scene in which evil is to be redressed, seems weakened or undermined.

As the weakness of Pope increased, his nearest friends, Lord Bolingbroke and a few others, gathered around him. The last scenes were passed almost with ease and tranquillity. He dined in company two days before he died; and on the very day preceding his death he took an airing on Blackheath. A few mornings before he died, he was found very early in his library writing on the immortality of the soul. This was an effort of delirium; and he suffered otherwise from this affection of the brain, and from inability to think in his closing hours. But his humanity and goodness, it was remarked, had survived his intellectual faculties. He died on the 30th of May 1744, and so quietly, that the attendants could not distinguish the exact moment of his dissolution.

We had prepared an account of Pope's quarrels, in which we had shown that, generally, he was not the aggressor; and often was atrociously ill-used before he retorted. This service to Pope's memory we had judged important, because it is upon these quarrels chiefly that the erroneous opinion has built itself of Pope's fretfulness and irritability. And this unamiable feature of his nature, together with a proneness to petty manœuvring, are the main foibles that malice has been able to charge upon Pope's moral character. Yet, with no better foundation for their malignity than these doubtful propensities, of which the first perhaps was a constitutional defect, a defect of his temperament rather than his will—and the second has been much exaggerated—many writers have taken upon themselves to treat Pope as a man if not absolutely unprincipled, and without moral sensibility, yet as mean, little-minded, indirect, splenetic, vindictive, and morose. Now the difference between ourselves and these writers is fundamental. They fancy that in Pope's character a basis of ignoble qualities was here and there slightly relieved by a few shining spots; we, on the contrary, believe that in Pope lay a disposition radically noble and generous, clouded and overshadowed by superficial foibles, or, to adopt the distinction of Shakspeare, they see nothing but "dust a little gilt," and we "gold a little dusted." A very rapid glance we will throw over the general outline of his character.

As a friend, it is noticed emphatically by Martha Blount and other contemporaries, who must have had the best means of judging, that no man was so warm-hearted, or so much sacrificed himself for others, as Pope; and in fact many of his quarrels grew out of this trait in his character. For once that he levelled his spear in his own quarrel, at least twice he did so on behalf of his insulted parents or his friends. Pope was also noticeable for the duration of his friendships;[1] some dropped him, but he never any throughout his life. And let it be remembered that amongst Pope's friends were the men of most eminent talents in those days; so that envy at least, or jealousy of rival power, was assuredly no foible of his. In that respect how different from Addison, whose petty manœuvring against Pope proceeded entirely from malignant jealousy. That Addison was more in the wrong even than has generally been supposed, and Pope more thoroughly innocent as well as more generous, we have the means, at a proper opportunity, of showing decisively. As a son, we need not insist on Pope's pre-eminent goodness. Dean Swift, who had lived for months together at Twickenham, declares that he had not only never witnessed, but had never heard of anything like it. As a Christian, Pope appears in a truly estimable light. He found himself a Roman Catholic by accident of birth; so was his mother; but his father was so upon personal conviction and conversion, yet not without extensive study of the questions at issue. It would have laid open the road to preferment, and preferment was otherwise abundantly before him, if Pope would have gone over to the Protestant faith. And in his conscience he found no obstacle to that change; he was a philosophical Christian, intolerant of nothing but intolerance, a bigot only against bigots. But he remained true to his baptismal profession, partly on a general principle of honour in adhering to a distressed and dishonoured party, but chiefly out of reverence and affection to his mother. In his relation to women, Pope was amiable and gentlemanly; and, accordingly was the object of affectionate regard and admiration to many of the most accomplished in that sex.

---

[1] We may illustrate this feature in the behaviour of Pope to Savage. When all else forsook him, when all beside pleaded the insults of Savage for withdrawing their subscriptions, Pope sent his in advance. And when Savage had insulted *him* also, arrogantly commanding him never "to presume to interfere or meddle in his affairs," dignity and self-respect made Pope obedient to these orders, except when there was an occasion of serving Savage. On his second visit to Bristol (when he returned from Glamorganshire), Savage had been thrown into the jail of the city. One person only interested himself for this hopeless profligate, and was causing an inquiry to be made about his debts at the time Savage died. So much Dr Johnson admits; but he *forgets* to mention the name of this long-suffering friend. *It was Pope.* Meantime, let us not be supposed to believe the lying legend of Savage; he was doubtless no son of Lady Macclesfield's, but an impostor, who would now be sent to the tread-mill.

This we mention especially, because we would wish to express our full assent to the manly scorn with which Mr Roscoe repels the libellous insinuations against Pope and Miss Martha Blount. A more innocent connection we do not believe ever existed. As an author, Warburton has recorded that no man ever displayed more candour or more docility to criticisms offered in a friendly spirit. Finally, we sum up all in saying that Pope retained to the last a true and diffusive benignity; that this was the quality which survived all others, notwithstanding the bitter trial which his benignity must have stood through life, and the excitement to a spiteful re-action of feeling which was continually pressed upon him by the scorn and insult which his deformity drew upon him from the unworthy.

But the moral character of Pope is of secondary interest: we are concerned with it only as connected with his great intellectual power. There are three errors which seem current upon this subject: *First*, that Pope drew his impulses from French literature; *secondly*, that he was a poet of inferior rank; *thirdly*, that his merit lies in superior "correctness." With respect to the first notion, it has prevailed by turns in every literature. One stage of society, in every nation, brings men of impassioned minds to the contemplation of manners, and of the social affections of man as exhibited in manners. With this propensity co-operates no doubt some degree of despondency when looking at the great models of the literature who have usually pre-occupied the grander passions, and displayed their movements in the earlier periods of literature. Now it happens that the French, from an extraordinary defect in the higher qualities of passion, have attracted the notice of foreign nations chiefly to that field of their literature in which the taste and the unimpassioned understanding preside. But in all nations such literature is a natural growth of the mind, and would arise equally if the French literature had never existed. The wits of Queen Anne's reign, or even of Charles II.'s, were not French by their taste or their imitation. Butler and Dryden were surely not French; and of Milton we need not speak; as little was Pope French, either by his institution or by his models. Boileau he certainly admired too much; and, for the sake of a poor parallelism with a passage about Greece in Horace, he has falsified history in the most ludicrous manner, without a shadow of countenance from facts, in order to make out that we, like the Romans, received laws of taste from those whom we had conquered. But these are insulated cases and accidents, not to insist on his known and most profound admiration, often expressed, for both Chaucer and Shakspeare and Milton. Secondly, that Pope is to be classed as an inferior poet, has arisen purely from a confusion between the departments of poetry which he cultivated and the merit of his culture. The first place must undoubtedly be given for ever,—it cannot be refused,—to the impassioned movements of the tragic, and to the majestic movements of the epic muse. We cannot alter the relations of things out of favour to an individual. But in his own department, whether higher or lower, that man is supreme who has not yet been surpassed; and such a man is Pope. As to the final notion, first started by Walsh, and propagated by Warton, it is the most absurd of all the three; it is not from superior correctness that Pope is esteemed more correct, but because the compass and sweep of his performances lies more within the range of ordinary judgments. Many questions that have been raised upon Milton or Shakspeare, questions relating to so subtle a subject as the flux and reflux of human passion, lie far above the region of ordinary capacities; and the indeterminateness or even carelessness of the judgment is transferred by a common confusion to its objects. But waiving this, let us ask what is meant by "correctness?" Correctness in what? In developing the thought? In connecting it, or effecting the transitions? In the use of words? In the grammar? In the metre? Under every one of these limitations of the idea, we maintain that Pope is *not* distinguished by correctness; nay, that, as compared with Shakspeare, he is eminently incorrect. Produce us from any drama of Shakspeare one of those leading passages that all men have by heart, and show us any eminent defect in the very sinews of the thought. It is impossible; defects there may be, but they will always be found irrelevant to the main central thought, or to its expression. Now turn to Pope; the first striking passage which offers itself to our memory is the famous character of Addison, ending thus:—

> Who would not laugh, if such a man there be,
> Who but must weep if Atticus were he?

Why must we laugh? Because we find a grotesque assembly of noble and ignoble qualities. Very well; but why, then, must we weep? Because this assemblage is found actually existing in an eminent man of genius. Well, that is a good reason for weeping; we weep for the degradation of human nature. But then revolves the question, why must we laugh? Because, if the belonging to a man of genius were a sufficient reason for weeping, so much we know from the very first. The very first line says, "Peace to all such. But were there one whose fires *true genius kindles* and fair fame inspires." Thus falls to the ground the whole antithesis of this famous character. We are to change our mood from laughter to tears upon a sudden discovery that the character belonged to a man of genius; and this we had already known from the beginning. Match us this prodigious oversight in Shakspeare. Again, take the *Essay on Criticism:* it is a collection of independent maxims, tied together into a fasciculus by the printer, but having no natural order or logical dependency; generally so vague as to mean nothing: like the general rules of justice, &c., in ethics, to which every man assents; but when the question comes about any practical case, *is* it just? The opinions fly asunder far as the poles. And, what is remarkable, many of the rules are violated by no man so often as by Pope, and by Pope nowhere so often as in this very poem. As a single instance, he proscribes monosyllabic lines; and in no English poem of any pretensions are there so many lines of that class as in this. We have counted above a score, and the last line of all is monosyllabic.

Not, therefore, for superior correctness, but for qualities the very same as belong to his most distinguished brethren, is Pope to be considered a great poet; for impassioned thinking, powerful description, pathetic reflection, brilliant narration. His characteristic difference is simply that he carried these powers into a different field, and moved chiefly amongst the social paths of men, and viewed their characters as operating through their manners. And our obligations to him arise chiefly on this ground, that having already, in the persons of earlier poets, carried off the palm in all the grander trials of intellectual strength, for the majesty of the epopee and the impassioned vehemence of the tragic drama, to Pope we owe it that we can now claim an equal pre-eminence in the sportive and aërial graces of the mock heroic and satiric muse; that in the *Dunciad* we possess a peculiar form of satire, in which (according to a plan unattempted by any other nation) we see alternatively her festive smile and her gloomiest scowl; that the grave good sense of the nation has here found its brightest mirror; and, finally, that through Pope the cycle of our poetry is perfected and made orbicular, that from that day we might claim the laurel equally, whether for dignity or grace.

POPERINGHE, a town of Belgium, in the province of W. Flanders, on the Shipvaer Canal, near the French frontier, 26 miles S. by W. of Ostend. It is pretty well built, and surrounded by walls; and contains several churches and convents, a fine town-hall, a college, hospital, orphan asylum, and several schools. There are here woollen factories, tanneries, soap-works, potteries, oil-mills, dye-works, and other manufacturing establishments. Hops are extensively raised in the vicinity; and these, together with corn and cattle, form the chief articles of trade. Pop. 10,849.

POPERY, in ecclesiastical history is regarded by Roman Catholics as a term of reproach, but having been generally received amongst Protestants, now comprehends the religious doctrines and practices adopted and maintained by the Church of Rome. The following summary, extracted chiefly from the decrees of the Council of Trent, continued under Paul III., Julius III., and Pius IV., by successive sessions, from the year 1545 to 1563, and the creed of Pope Pius IV. subjoined to it, and bearing date November 1564, may not be unacceptable to the reader. One of the fundamental tenets strenuously maintained by Catholic writers is the infallibility of the Church of Rome; and though they are not agreed whether this privilege belongs to the Pope or a general council, or to both united, yet they pretend that an infallible living judge is absolutely necessary to determine controversies, and to secure peace, in the Christian Church. Protestants, however, allege that the claim of infallibility in any church is not justified by the authority of Scripture, much less does it appertain to the Church of Rome; that it is inconsistent with the nature of religion, and the personal obligations of its professors; and that it has proved ineffectual to the end for which it is supposed to have been granted, since popes and councils have disagreed in matters of importance, and, with the advantage of this pretended infallibility, have been incapable of maintaining union and peace. Another essential article of the Catholic creed is the supremacy of the Pope, or his sovereign power over the universal church.

Further, the doctrine of the seven sacraments is a peculiar and distinguishing doctrine of the Church of Rome. These are baptism, confirmation, the eucharist, penance, extreme unction, holy orders, and matrimony The Council of Trent (sess. vii., can. 1) pronounces an anathema upon those who say that the sacraments are more or fewer than seven, or that any one of the above number is not truly and properly a sacrament. And yet it does not appear that they amounted to this number before the twelfth century, when Hugo de St Victor and Peter Lombard, about the year 1144, taught that there were seven sacraments. The council of Florence, held in the year 1438, was the first council which determined this number. These sacraments confer grace, according to the decree of the Council of Trent (sess. vii., can. 8) *ex opere operato*, that is, by the mere administration of them; three of them, viz., baptism, confirmation, and holy orders, are said (can. 9) to impress an indelible character, so that they cannot be repeated without sacrilege; and the efficacy of every sacrament depends upon the intention of the priest by whom it is administered (can. 11). Pope Pius expressly enjoins that all these sacraments should be administered according to the received and approved rites of the Catholic Church. With regard to the eucharist in particular, we may here observe, that the Church of Rome holds the doctrine of transubstantiation; the necessity of paying divine worship to Christ under the form of the consecrated bread or host; and the propitiatory sacrifice of the mass, according to the Catholic ideas of which Christ is truly and properly offered as a sacrifice of propitiation as often as the priest says mass. It likewise practises solitary mass, in which the priest alone consecrates, communicates, and allows communion only in one kind, namely, the bread, to the laity. (Sess. xiv.)

The doctrine of merits is another distinguishing tenet of Popery, with regard to which the Council of Trent has expressly decreed (sess. vi., can. 32) that the good works of justified persons are truly meritorious, deserving not only an increase of grace, but eternal life, and an increase of glory; and it has anathematized all who deny this doctrine. Of the same kind is the doctrine of satisfaction, which supposes that penitents may truly satisfy by the afflictions they endure under the dispensations of Providence, or by voluntary penances to which they submit for the temporary penalties of sin, to which they are subject even after the remission of their eternal punishment. (Sess. vi., can. 30; and sess. xiv., can. 8 and 9.) In this connection we may mention the distinction of venial and mortal sins. The greatest evils arising from the former are the temporary pains of purgatory; but no man, it is said, can obtain the pardon of the latter without confessing to a priest, and performing the penances which he imposes.

The Council of Trent (sess. xiv., can. 1) has expressly decreed that every one is accursed who shall affirm that penance is not truly and properly a sacrament instituted by Christ in the universal church, for reconciling those Christians to the divine majesty who have fallen into sin after baptism. And this sacrament, it is declared, consists of two parts, the matter and the form; the matter being the act of the penitent, including contrition, confession, and satisfaction; the form, the act of absolution on the part of the priest. Accordingly it is enjoined, that it is the duty of every man who has fallen after baptism to confess his sins, once a year at least, to a priest; that this confession is to be secret, for public confession is neither commanded nor expedient; and that it must be exact and particular, including every kind and act of sin, with all the circumstances attending it. When the penitent has so done, the priest pronounces an absolution, which is not conditional or declarative only, but absolute and judicial. This secret or auricular confession was first decreed and established in the fourth council of Lateran, under Pope Innocent III., in 1215 (cap. 21); and the decree of this council was afterwards confirmed and enlarged in the Council of Florence and in that of Trent, which ordains that confession was instituted by Christ, that by the law of God it is necessary to salvation, and that it has always been practised in the Christian Church. As for the penances imposed on the penitent by way of satisfaction, they have been commonly the repetition of certain forms of devotion, as paternosters or ave-marias, the payment of stipulated sums, pilgrimages, fasts, or various species of corporal discipline. But the most formidable penance, in the estimation of those who belong to the communion of the Church of Rome, is the temporary pains of purgatory. Yet under all the penalties which are inflicted or threatened in that church, it has provided relief by its indulgences, and by its prayers or masses for the dead, performed professedly for relieving and rescuing the souls that are detained in purgatory.

Another article which has long been authoritatively enjoined and observed in the Church of Rome is the celibacy of her clergy. This was first enjoined at Rome by Gregory VII. about the year 1074, and established in England by Anselm, Archbishop of Canterbury, about the year 1175; though his predecessor Lanfranc had imposed it upon the prebendaries and clergy who lived in towns. And though the Council of Trent was repeatedly petitioned by several princes and states to abolish this restraint, yet the obligation of celibacy was rather established than relaxed by this council; for they decreed that marriage contracted after a vow of continence is neither lawful nor valid, and thus deprived the church of the possibility of ever restoring marriage to the clergy. If marriage, after a vow, be in itself unlawful, the greatest authority upon earth cannot dispense with it, nor permit marriage to the clergy, who have already vowed continence.

To the doctrines and practices above recited may further be added the worship of images, of which Protestants accuse the Papists. The Papist replies, that he is taught to use them so as to cast his eyes upon the pictures or images, and thence to raise his heart to the things represented, and there to employ it in meditation, love, thanksgiving, and desire of imitation, as the object requires. Hence he finds a convenience in saying his prayers with some devout pictures before him, the sight of which recalls his wandering thoughts to the right object, and as certainly brings something good into his mind, as an immodest picture disturbs his heart.

The Council of Trent likewise decreed that all bishops and pastors who have the cure of souls, do diligently instruct their flocks that it is good and profitable to desire the intercession of saints reigning with Christ in heaven. The Papists confess that we have but one Mediator of redemption, but affirm that it is acceptable to God that we should have many mediators of intercession. Moses, say they, was such a mediator for the Israelites; Job for his three friends; Stephen for his persecutors. The Romans were thus desired by St Paul to be his mediators; so were the Corinthians and the Ephesians, so almost every sick man desires the congregation to be his mediators, by remembering him in their prayers. And so, too, the Papist desires the blessed in heaven to be his mediators, that is, that they would pray to God for him. But between these living and dead mediators there is no similarity. Besides, as omnipresence in a creature is contrary to one of the first principles of natural religion, so it receives no countenance from Scripture, or any Christian writer of the first three centuries. Other practices peculiar to the Papists are the religious honour and respect that they pay to sacred relics, by which they understand not only the bodies and parts of the bodies of the saints, but any of those things that appertained to them, and which they had touched; and the celebration of divine service in an unknown tongue, in regard to which the Council of Trent has denounced an anathema on any one who shall say that mass ought to be celebrated only in the vulgar tongue (sess. xxv. and sess. xxii., can. 9). Though the Council of Lateran, under Innocent III. in 1215, had (can. 9) expressly decreed, that as in several parts within the same city and diocese there are many people of different manners and rites mixed together, but of one faith, so the bishops of such cities or dioceses should provide fit men for celebrating divine offices, according to the diversity of tongues and rites, and for administering the sacrament.

We shall only add further, that the Church of Rome maintains that unwritten traditions ought to be added to the holy Scriptures, in order to supply their defect, and should be regarded as of equal authority; that the books of the Apocrypha are canonical Scripture; that the vulgate edition of the Bible is to be deemed authentic; and that the Scriptures are to be received and interpreted according to that sense which the holy mother church, to whom it belongs to judge of the true sense, has held, and does hold, and according to the unanimous consent of the Fathers.

Such are the principal and distinguishing doctrines of Catholicism or Popery, most of which have received the sanction of the Council of Trent, and that of the creed of Pope Pius IV., which is received, professed, and sworn to by every one who enters into holy orders in the Church of Rome, as well as by all proselytes or converts. At the close of this creed we are told that the faith contained in it is so absolutely and indispensably necessary that no man can be saved without it.

POPHAM, Sir John, chief justice of the King's Bench, was born of gentle blood in 1531 at Wellington, in the county of Somerset. While still a child he was stolen by a band of gipsies, who kept him some months, branded his arm with a cabalistic mark, and so invigorated a constitution that had been previously sickly, that from that period he grew up to be a man of extraordinary stature and activity. He was sent to Baliol College, Oxford, in 1547, where he amassed a good stock of classical learning and of dogmatic divinity. On becoming a Middle Templar in 1551 he got into bad company, and utterly neglected his juridical studies. He preferred theatres and gaming-houses; he was given to drinking, and took to the roads. Nor did he leave off when he was called to the bar. "In his youthful days," says Fuller (*Worthies*, vol. ii. 284), "he was as stout and skilful a man at sword and buckler as any in that age, and wild enough in his recreations." An unhappy wife, and the birth of a child for whom he felt attachment, put a check upon his extraordinary life. He accordingly, at the age of thirty, prepared "a very good entertainment for his camerades," took a final leave of them, and took to study. "He was a strong, stout man," says Aubrey (iii. 492), "and could endure to sit at it day and night." He became a consummate lawyer, according to Coke, and, despite the stories which were circulated regarding his previous career, he was made Serjeant Popham in 1571. He was chosen solicitor-general at her Majesty's Queen Elizabeth's) express wish in 1579, and speaker of the House of Commons in 1581. He succeeded Sir Gilbert Gerrard as attorney-general in 1585; and was present at the court of Fotheringay during the trial of the Queen of Scots. On the 8th of June 1592 he received his writ as chief justice of England, was knighted by the Queen at Greenwich, and was sworn of the Privy Council. He was supposed to conduct himself in it very creditably, but was charged with extreme severity. In ordinary larcenies, and, strange to say, in highway robberies, there was little chance of an acquittal. In short, he was notorious as a "hanging judge." When the young Earl of Essex planned an insurrection in the city in 1641, Popham conducted himself with very great courage. On the death of his royal mistress he did not allow the sword of justice to rust in its scabbard. Sir Walter Raleigh was tried before him for being concerned in the plot to place the Lady Arabella Stuart on the throne, and found guilty; Guy Fawkes and his associates were tried and found guilty; Garnet, superior of the Jesuits, was tried and found guilty, when Popham was struck with a mortal disease, of which he died on the 1st of June 1607, in the seventy-second year of his age. This "huge, heavy, ugly man" left behind him the greatest estate ever amassed by lawyer; some say as much as L.10,000 a year, which was in due measure squandered by his son John. Littlecote House, the family residence, and about which hangs a tale, is said to have become the property of Sir John Popham as the price of legal corruption. He compiled a volume of wretchedly ill-done Reports of his Decisions while he was chief justice of the King's Bench. (See Lord Campbell's *Lives of the Chief Justices of England.*)

POPLAR, a parish of England in the county of Middlesex, forming a suburb of London, and washed on the E., S., and W. by the Thames, 4 miles E.S.E. of St Paul's. It contains numerous churches belonging to various denominations, some of them handsome buildings, a town-hall, East India Hospital, several schools, and a literary and scientific institution. The manufacture of plate-glass, machinery, iron and brass castings, &c., is carried on here. In this parish are situated the West India Docks. (See London.) Area of the parish 2918 acres. Pop. (1851) 47,162.

POPO, Great and Little, two towns of Africa in the kingdom of Dahomey, on the Guinea coast, the former 15 miles W. of Whydah, and the latter about as far farther W. The inhabitants are employed in raising indigo and cotton, making cotton cloth, working metals, manufacturing salt by evaporation and lime from oyster-shells, and trading in slaves. Pop. of each town about 5000.

POPOCATEPETL, or the *Smoking Mountain*, as its name imports in Mexican, an active volcano of Mexico, in the state of La Puebla, 35 miles S.W. of the town of that name. It is cone-shaped, and rises to the height of 17,793 feet above the sea. From its base up to the height of 12,700 feet, it is covered with forests; but above that the mountain is quite bare, its sides being strewn with pumice, sand, and ashes, from the crater, and generally covered with snow. The crater is about a mile in diameter, and 1000 feet deep. Good sulphur may be obtained from it.

POPPÆA, SABINA, a Roman matron, daughter of Titus Ollius, and grand-daughter of Poppæus Sabinus, who had been consul in A.D. 9. She was married and had a son to Rufius Crispinus, a Roman knight. Her beauty captivated Otho, one of Nero's favourites, who carried her off and married her; but he was not long permitted to retain her, for Nero, having heard her extolled for her accomplishments, sent Otho out of Italy under pretence of presiding over one of the Roman provinces, shortly after which Nero murdered his mother, and subsequently his wife Octavia, and married Poppæa; but she did not long enjoy the imperial dignity, for Nero soon began to despise her, and treat her with great barbarity. She bore him a son; and when she was again far advanced in pregnancy, he is said to have kicked her, of which she died, about 65 A.D. It is said she was so anxious to preserve her beauty that 500 she-asses were milked, in which she used daily to bathe.

POPPI, a town of Tuscany, in the province of Florence, on the right bank of the Arno, 26 miles E. of Florence. It contains a palace, court-house, several churches, convents, and schools, a public library, theatre, and hospital. Vines are cultivated in the vicinity. Pop. 5654.

POPULATION.[1]

Object of the article.

THE population of the principal states, of which an account has been given in the course of this work, will be found under their proper heads. The object of this article is to explain the general laws which regulate the increase or decrease of population, and the manner in which they affect the state and condition of human society.

Tendency of all plants and animals to increase in a geometrical progression.

In taking a view of animated nature, we cannot fail to be struck with a prodigious power of increase in plants and animals. Their capacity in this respect is indeed almost infinitely various, according with the endless variety of the works of nature, and the different purposes which they seem appointed to fulfil. But whether they increase slowly or rapidly, if they increase by seed or generation, their natural tendency must be to increase in a geometrical ratio, that is, by multiplication; and at whatever rate they are increasing during any one period, if no further obstacles be opposed to them, they must proceed in a geometrical progression.

In the growth of wheat a vast quantity of seed is unavoidably lost. When it is dibbled instead of being sown in the common way, two pecks of seed wheat will yield as large a crop as two bushels, and thus quadruple the proportion of the return to the quantity of seed put into the ground. In the *Philosophical Transactions* for 1768 an account is given of an experiment in which, by separating the roots obtained from a single grain of wheat, and transplanting them in a favourable soil, a return was obtained of above 500,000 grains. But without referring to peculiar instances or peculiar modes of cultivation, it is known that calculations have often been made, founded on positive experience, of the produce of wheat in different soils and countries, cultivated in an ordinary way, and making allowance for all ordinary destruction of seed.

Humboldt has collected some estimates of this kind, from which it appears that France, the north of Germany, Poland, and Sweden, taken generally, produce from five to six grains for one; some fertile lands in France produce fifteen for one; and the good lands in Picardy and the Isle of France from eight to ten grains for one. Hungary, Croatia, and Sclavonia yield from eight to ten grains for one. In the Regno de la Plata, twelve grains for one are produced; near the city of Buenos Ayres, sixteen for one; in the northern part of Mexico, seventeen; and in the equinoctial regions of Mexico, twenty-four for one.[2]

Now, supposing that in any one country during a certain period, and under the ordinary cultivation, the return of wheat was six grains for one, it would be strictly correct to say that wheat had the capacity of increasing in a geometrical ratio, of such a nature as to sextuple itself every year. And it might safely be calculated hypothetically, that if, setting out from the produce of one acre, land of the same quality could be prepared with sufficient rapidity, and no wheat were consumed, the rate of increase would be such as completely to cover the whole earthy surface of our globe in fourteen years.

In the same manner, if it be found by experience that on land of a certain quality, and making allowance for the ordinary mortality and accidents, sheep will increase on an average so as to double their numbers every two years, it would be strictly correct to say that sheep have the natural capacity of increasing in a geometrical progression, of which the common multiple is two, and the term two years; and it might safely be said, that if land of the same quality could be provided with sufficient rapidity, and no sheep were consumed, the rate of increase would be such, that if we were to begin with the full number which could be supported on an acre of land, the whole earthy part of the globe might be completely covered with sheep in less than seventy-six years.

If, out of this prodigious increase of food, the full support of mankind were deducted, supposing them to increase as fast as they have ever yet increased in any country, the deduction would be comparatively inconsiderable; and the rate of increase would still be enormous, till it was checked, either by the natural want of will on the part of mankind to make efforts for the increase of food beyond what they could possibly consume, or, after a certain period, by their absolute want of power to prepare land of the same quality, so as to allow of the same rate of progress.

Owing to these two causes combined, we see that, notwithstanding this prodigious power of increase in vegetables and animals, their actual increase is extremely slow; and it is obvious, that, owing to the latter cause alone, and long before a final stop was put to all further progress, their actual rate of increase must of necessity be very greatly retarded; as it would be impossible for the most enlightened human efforts to make all the soil of the earth equal in fertility to the average quality of land now in use; while the practicable approaches towards it would require so much time as to occasion, at a very early period, a constant and great check upon what their increase would be if they could exert their natural powers.

---

[1] The present article on POPULATION, written for the last edition of this work by the late Mr Malthus, has been permitted to stand in its entirety in the present edition. The Editor has been persuaded to adopt this course, more perhaps from the acknowledged excellence of the article itself, than from a strict regard to the perfect justness of all its sentiments. No one will doubt the writer's fundamental principle—that the amount of the human race must be in a proportion to the amount of food procurable for their support. But instead of drawing from this an injunction to mankind to throw their energies into productiveness, his argument seems to lead to the necessity of preventing increase, from a dread that it might outdo the production of food. Malthus omitted the influence of free trade, which puts all the world at the command of an increasing and producing people.

[2] *Nouvelle Espagne*, liv. iv., c. ix., p. 98.

Elevated as man is above all other animals by his intellectual faculties, it is not to be supposed that the physical laws to which he is subjected should be essentially different from those which are observed to prevail in other parts of animated nature. He may increase slower than most other animals, but food is equally necessary to his support; and if his natural capacity of increase be greater than can be permanently supplied with food from a limited territory, his increase must be constantly retarded by the difficulty of procuring the means of subsistence.

The power of producing food limited by the quantity and nature of the soil.

The main peculiarity which distinguishes man from other animals, in the means of his support, is the power which he possesses of very greatly increasing these means. But this power is obviously limited by the scarcity of land, by the great natural barrenness of a very large part of the surface of the earth, and by the decreasing proportion of produce which must necessarily be obtained from the continual additions of labour and capital applied to land already in cultivation.

It is, however, specifically with this diminishing and limited power of increasing the produce of the soil, that we must compare the natural power of mankind to increase, in order to ascertain whether, in the progress to the full cultivation and peopling of the globe, the natural power of mankind to increase must not of absolute necessity be constantly retarded by the difficulty of procuring the means of subsistence, and if so, what are likely to be the effects of such a state of things.

The natural rate of increase applicable to mankind.

In an endeavour to determine the natural power of mankind to increase, as well as their power of increasing the produce of the soil, we can have no other guide than past experience.

The great check to the increase of plants and animals, we know from experience, is the want of room and nourishment; and this experience would direct us to look for the greatest actual increase of them in those situations where room and nourishment were the most abundant.

On the same principle, we should expect to find the greatest actual increase of population in those situations where, from the abundance of good land, and the manner in which its produce is distributed, the largest portion of the necessaries of life is actually awarded to the mass of the society.

Of the countries with which we are acquainted, the United States of America, formerly the North American colonies of Great Britain, answer most nearly to this description. In the United States not only is there an abundance of good land, but, from the manner in which it has been distributed, and the market which has been opened for its produce, there has been a greater and more constant demand for labour, and a larger portion of necessaries has been awarded to the labourer, than in any of those other countries which possess an equal or greater abundance of land and fertility of soil.

Here, then, we should expect to find that the natural power of mankind to increase, whatever it may be, would be most distinctly marked; and here, in consequence, it appears that the actual rate of the increase of population has been more rapid than in any known country, although, independently of the abundance of good land, and the great demand for labour, it is distinguished by no other circumstances which appear to be peculiarly favourable to the increase of numbers.

It has been stated that all animals, according to the known laws by which they are produced, must have a capacity of increasing in a geometrical progression. And the question with regard to man is, what is the rate of this geometrical progression?

Fortunately, in the country to which we should naturally turn our eyes for an exemplification of the most rapid rate of increase, there have been four enumerations of the people, each at the distance of ten years; and though the estimates of the increase of population in the North American colonies at earlier periods were of sufficient authority, in the absence of more certain documents, to warrant most important inferences, yet as we now possess such documents, and as the period they involve is of sufficient length to establish the point in question, it is no longer necessary to refer to earlier times.

Increase of population in the United States of America.

According to a regular census made by order of Congress in 1790, which there is every reason to think is essentially correct, the white population of the United States was found to be 3,164,148. By a similar census in 1800, it was found to have increased to 4,312,841. It had increased, then, during the ten years from 1790 to 1800, at a rate equal to 36·3 per cent., a rate which, if continued, would double the population in twenty-two years and about four months and a half.

According to a third census, in 1810, the white population was found to be 5,862,092,[1] which, compared with the population of 1800, gives an increase in the second ten years at the rate of nearly thirty-six per cent., which, if continued, would double the population in about twenty-two years and a half.

According to the fourth census, in 1820, the white population was found to be 7,861,710,[2] which, compared with the population of 1810, gives an increase in the third ten years at a rate per cent. of 34·1, which, if continued, would double the population in twenty-three years and seven months.

If we compare the period of doubling according to the rate of increase in the most unfavourable ten years of this series, with twenty-five years, we shall find the difference such as fully to cover all the increase of population which would have taken place from emigration.

Amount of emigration.

It appears from a reference to the most authentic documents which can be collected on both sides of the Atlantic, that the emigration to the United States, during the last twenty-five years, falls decidedly short of an average of 10,000 a year. Dr Seybert, the best authority on the other side of the water, states that, from 1790 to 1810, it could not have been so much as 6000 a year. Our official accounts of the number of emigrants to the United States from England, Ireland, and Scotland, during the ten years from 1812 to 1821 inclusive, give an average of less than 7000, although the period includes the extraordinary years 1817 and 1818, in which the emigrations to the United States were much greater than they were ever known to be before or since. The official American accounts, as far as they go, which is only for two years from the 30th September 1819, tend to confirm this average;[1] and, allowing fully for the emigrants from other European countries, the general average will still be under the ten thousand.

---

[1] These numbers are taken from Dr Seybert's Statistical Annals, p. 23.

[2] This number is taken from the American National Calendar for 1822, and has since been compared with the original census as published for the use of the members of Congress.

A new mode was, however, some time ago suggested of estimating the amount of increase in any country derived from emigration.[2] It has been justly stated, that when a census is taken every ten years, and the population is distinguished into those above and those below ten years of age, all above ten years of age, exclusive of emigrants, must have existed in the census immediately preceding, and, consequently, after having made a proper allowance for the mortality during these ten years, the excess above the remaining number must be attributed to emigration. If we had the means of estimating with accuracy the loss which would be sustained in America in ten years by a population not increased by additional births, this mode of estimating the amount of emigration would be unobjectionable, and often very useful.

But unfortunately the means are deficient. Even the annual mortality in the United States is not known. It was supposed by Dr Price (vol. ii. p. 50, 7th edit.) to be one in fifty; by Mr Barton, in the Transactions of the Society at Philadelphia (vol. iii. No. 7), one in forty-five; and it is stated by Mr Bristed, in his work on America and her Resources (p. 20), that the annual deaths average throughout the United States one in forty, in the healthiest districts one in fifty-six, and in the most unhealthy one in thirty-five.

If, however, we could ascertain accurately the average annual mortality, we should still be unable to ascertain the amount of the loss in question; as, under any given law of mortality, it would depend so very much upon the rate at which the population was increasing. The truth of this observation will be placed in a striking light by the following short table, with which we have been favoured by a very able calculator, Mr Milne, author of a well-known Treatise on Annuities and Assurances. It is constructed on the supposition that the population, in each case, is always subject to the same law of mortality as that which prevailed in all Sweden and Finland during the five years ended with 1805, and that the number of births in the present year living in each case is 10,000.

	The Population constantly the same.	The Population increasing in geometrical progression for more than a hundred years, so as to double itself every	
		Fifty Years.	Twenty-five Years.
Total population ten years since..........	393,848	230,005	144,358
Total above ten years of age now..........	320,495	195,566	126,176
Died during the term of ten years, out of those living at its commencement......	73,353	34,439	18,182
Being one of...............	5·3692	6·6786	7·9396

We see from this table, that under the same law of mortality, the difference of loss sustained in ten years, by a people not increased by fresh births, would in the three cases supposed, of a stationary population, a population doubling in fifty years, and a population doubling in twenty-five years, be as one in 5·3692, one in 6·6786, and one in 7·9396; and that when the population is doubling itself in twenty-five years, the loss would be very little more than one eighth.

But the censuses must be allowed to form a *prima facie* evidence that the population of the United States has, for a considerable time, been going on doubling itself in twenty-five years; and assuming this evidence to be true, which we are warranted in doing till better evidence is produced on the other side, it will appear that the amount of immigration, deduced from the rule here referred to, is less than 10,000 a year.

Thus the white population of the United States in 1800 was 4,312,841.[3] This population, without further accession of births, would in 1810 be diminished one eighth, or reduced to 3,773,736. In 1810 the population above ten years of age was 3,845,389; and, subtracting the former number from the latter, the difference, or amount of emigration, will be 71,653, or 7165 a year.

Again, the white population of 1810 was 5,862,092, which, diminished by one eighth in ten years, would be 5,129,331. The population above ten years of age in 1820 was 5,235,940.[4] Subtracting the former from the latter, the difference, or amount of emigration, is 106,608, or 10,660 a year; showing, as we should expect, a greater amount of emigration from 1810 to 1820 than from 1800 to 1810, but, even in the latter ten years, and including emigrations from Canada, as well as all other countries, little exceeding 10,000.

Altogether, then, we can hardly err in defect, if we allow 10,000 a year for the average increase from emigration during the twenty-five years from 1795 to 1820; and applying this number to the slowest period of increase, when the rate was such as to double the population in twenty-three years and seven months, it may be easily calculated, that in the additional year and five months a population of 5,862,000 would have increased to an amount much more than sufficient to cover an annual emigration of 10,000 persons, with the increase from them at the same rate.

Such an increase from them, however, would not take place. It appears from an account in the National Calendar of the United States for the year 1821, that of the 7001 persons who had arrived in America from the 30th of September 1819 to the 30th of September 1820, 1959 only were females, and the rest, 5042, were males; a proportion which, if it approaches towards representing the average, must very greatly reduce the number from which any increase ought to be calculated.

If, however, we omit these considerations; if we suppose a yearly emigration from Europe to America of 10,000 persons for the twenty-five years from 1795 to 1820, the greatest part of which time Europe was involved in a most extensive scene of warfare, requiring all its population; and further, if we allow for an increase of all the emigrants during the *whole period*, at the fullest rate; the remaining numbers will still be sufficient to show a doubling of the population in less than twenty-five years.

The white population of 1790 was 3,164,148. This population, according to the rate at which it was increasing, would have amounted to about 3,694,100 in 1795; and supposing it to have just doubled itself in the twenty-five years from 1795 to 1820, the population in 1820 would have been 7,388,200. But the actual white population of 1820 appears, by the census then taken, to be 7,861,710, showing an excess of 473,510; whereas an emigration of 10,000 persons annually, with the increase from them at three per cent., a rate which would double a population in less than twenty-four years, would only amount to 364,592.

---

[1] American National Calendar for 1821, p. 237; and North American Review for October 1822, p. 304.

[2] This mode was suggested by Mr Booth, in Mr Godwin's Answer to Mr Malthus.

[3] Seybert's Statistical Annals, p. 23.

[4] American National Calendar for 1822, p. 246.

But the most striking confirmation of the censuses of the United States, and the most remarkable proof of the rate of increase being occasioned almost exclusively by procreation, have been furnished to us by Mr Milne. In his work on Annuities and Assurances, which contains much valuable and interesting information on the subject of population, he had noticed the effects of the frequent pressure of want on the labouring classes of Sweden, which, by increasing the proportion of deaths, rendered the law of mortality so accurately observed in that country by Professors Wargentin and Nicander inapplicable to other countries more favourably circumstanced. But the law of mortality was observed to be gradually improving from the time that Dr Price constructed his Swedish table; and the period from 1800 to the end of 1805 was so free from scarcities and epidemics, and the healthiness of the country had been further so much improved by the introduction of vaccination, that he justly thought the law of mortality, as observed during these five years, might suit countries where the condition of the people was known to be much better than it had generally been in Sweden. On these grounds he applied the Swedish law of mortality, during the term mentioned, to the hypothesis of a population which had been increasing by procreation, in geometrical progression, for more than a hundred years, so as to double every twenty-five years. Assuming this population to be one million, he distributed it, by a process well known to persons conversant with these subjects, into the different ages referred to in the American censuses, and then compared them with the same number of persons distributed according to the actual returns of the ages in the American censuses for the three periods of 1800, 1810, and 1820. The results are as follows:

Distribution of a Population of 1,000,000 *Persons in the under-mentioned intervals of Age.*

Between the Ages of	According to			
	The Hypothesis.	United States. Census of 1800.	Census of 1810.	Census of 1820.
0 and 10	337,592	334,556	344,024	333,995
10 and 16	145,583	154,898	156,345	154,913
16 and 26	186,222	185,046	189,227	198,114
26 and 45	213,013	205,289	190,461	191,139
45 and 100	117,590	120,211	119,943	121,839
0 and 100	1,000,000	1,000,000	1,000,000	1,000,000
Under 16	483,175	489,454	500,369	488,908
Above 16	516,825	510,546	499,631	511,092

The general resemblance in the distribution of the ages in the three different censuses to each other, and to the hypothesis, clearly proves,

1*st*, That the distribution of the ages in the different enumerations must be made with some care, and may, therefore, be relied on as in the main correct.

2*dly*, That the law of mortality assumed in the hypothesis cannot deviate essentially from the law of mortality which prevails in the United States; and,

3*dly*, That the actual structure of the American population differs very little from what it would be if it were increasing regularly from procreation only, in geometrical progression, so as to double itself every twenty-five years; and that we may, therefore, safely infer that it has been very little disturbed by immigration.

If to these proofs of the rapid increase of population which has actually taken place, we add the consideration that this rate of increase is an average applying to a most extensive territory, some parts of which are known to be unhealthy; that some of the towns of the United States are now large; that many of the inhabitants must be engaged in unwholesome occupations, and exposed to many of those checks to increase which prevail in other countries; and further, that in the western territories, where these checks do not occur, the rate of increase is beyond comparison more rapid than the general average, after making the fullest allowance for immigration; it must appear certain, that the rate at which the population of the whole of the United States has actually increased for the last thirty years must fall very decidedly short of the actual capacity of mankind to increase under the most favourable circumstances.

The rate of increase in the United States confirmed by that of other countries.

The best proof that can be obtained of the capacity of mankind to increase at a certain rate, is their having really increased at that rate. At the same time, if any peculiarly rapid increase which had appeared to take place in a particular country were quite unsupported by other evidence, we might be disposed to attribute it to error or accident, and might scarcely be justified in founding important conclusions upon it. But this is far from being the case in the present instance. The rate of increase which has at times taken place in other countries, under the operation of great and obvious checks to the progress of population, sufficiently shows what might be expected if these checks were removed.

Increase of population in New Spain.

The countries most resembling the United States of America are those territories of the new world which lately belonged to Spain. In abundance and fertility of soil they are indeed superior; but almost all the vices in the government of the mother country were introduced into her colonial possessions, and particularly that very unequal distribution of landed property which takes place under the feudal system. These evils, and the circumstance of a very large part of the population being Indians in a depressed state, and inferior in industry and energy to Europeans, necessarily prevent that rapid increase of numbers which the abundance and fertility of the land would admit of. But it appears, from the instructive and interesting account of New Spain which M. Humboldt has not long since given to the public, that for the last half of the eighteenth century the excess of the births above the deaths, and the progress of the population, have been very great. The following are the proportions of burials to baptisms in the registers of eleven villages, the details of which were communicated to M. Humboldt by the curates.

	Burials.	Baptisms.
At Dolores	100	253
Singuilucan	100	234
Calymaya	100	202
Guanaxuato	100	201
St Anne	100	195
Marsil	100	194
Queretaro	100	188
Axapuzco	100	157
Yguala	100	140
Malacatepec	100	130
Panuco	100	123

The mean proportion is 100 to 183

But the proportion which M. Humboldt considers as best suited to the whole of the population is 100 to 170.

In some of the villages above mentioned, the proportion of the births to the population is extraordinarily great, and the proportion of deaths very considerable; showing, in a striking point of view, the early marriages and early deaths of a tropical climate, and the more rapid passing away of each generation.[1]

At Queretaro, it appears that the baptisms were to the population as one to fourteen, and the burials as one to twenty-six.

At Guanaxuato, including the neighbouring mines of St Anne and of Marsil, the baptisms were to the population as one to fifteen, and the burials as one to twenty-nine.

The general result from all the information which could be collected was, that the proportion of births to the population, for the whole of the kingdom of New Spain, was as one to seventeen, and of the deaths as one to thirty. These proportions of births to deaths, if they were continued, would double the population in twenty-seven and a half years.

M. Humboldt further observes, that the information which he had collected respecting the proportions of the births to the deaths, and of these to the whole population, proves, that if the order of nature were not interrupted by some extraordinary and disturbing causes, the population of New Spain ought to double itself every nineteen years.[2]

It is known, however, that these causes do occur in the actual state of things; consequently we cannot consider the actual rate of the increase of population in New Spain as greater than according to the former calculation. But a rate of increase such as to double the population in twenty-seven and a half years, in spite of all the obstacles enumerated by M. Humboldt, is very extraordinary. It is next to the increase of the United States, and greatly superior to any that can be found in Europe.

Yet in Europe, the tendency to increase is always very strongly marked, and the actual increase for periods of some length is sometimes much greater than could be expected beforehand, considering the obstacles to be overcome.

It appears from Sussmilch,[3] that the population of Prussia and Lithuania, after the great plague in 1709 and 1710, doubled itself in about forty-four years, from the excess of the births above the deaths enumerated in the registers.

In Russia, the whole population in 1763 was estimated, by enumeration and calculation, at twenty millions, and in 1796 at thirty-six millions.[4] This is a rate of increase which would occasion a doubling in less than forty-two years.

In 1695, the population of Ireland was estimated at 1,034,000. According to the returns in 1821, it had increased to the prodigious amount of 6,846,949;[5] and it is thought that when the deficiencies have been supplied by the final returns of the enumerators, it will be upwards of seven millions. This is an example of an actual increase for 125 years together, at a rate which would double the population in about forty-five years; and this has taken place under the frequent pressure of great distress among the labouring classes of society, and the practice of frequent and considerable emigration.

But for the proof of the power of population to increase under great obstacles of the preventive, as well as of the positive kind, we need not go out of Great Britain. The rate of increase since our enumerations have commenced has been very remarkable for a country which was considered as well peopled before, and some of the details accompanying the returns tend strikingly to illustrate the principle of population.

Increase of population in Great Britain from 1800 to 18

The population of Great Britain, according to the enumerations of 1821 and 1811, was, respectively, 10,942,646 and 12,596,803.[6] This is a rate of increase, during the ten years, of rather above fifteen per cent., a rate which, if continued, would double the population in between forty-nine and fifty years.

By the enumeration of 1821, it appears that the population was 14,391,631,[7] which, compared with the population of 1811, gives a rate of increase during the ten years of 14·25 per cent., a rate which would double the population in about fifty-two years.

According to these numbers, the rate of increase during the last ten years was slower than that of the first; but it appears, from the excess of the number of males above females in the enumeration of 1811, so opposite to the state of the population in 1801 and 1821, when the females exceeded the males, particularly at the latter period, that of the large number added to the population for the army, navy, and registered merchant ships in 1811, a considerable proportion must have been foreigners. On this account, and on account of the further difficulty of knowing what part of this number might properly belong to Ireland, it has been proposed to estimate the rate per cent. at which the population has increased in each of the ten years by the females only; and, according to this mode of computation, the population increased during the first period at the rate of 14·02 per cent., and during the second at the rate of 15·82. (Preliminary Observations, p. 8.) This last rate of increase would double the population in less than forty-eight years.

The only objection to this mode of computation is, that it does not take into consideration the greater destruction of the males during the war. In 1801, the females exceeded the half of the population by 21,031, and in 1821 by 63,890, while, at the intermediate period, owing to the causes above mentioned, the females fell short of the half of the males by 35,685.

When, however, a proper distribution has been made of the army and navy among the resident population, and taking England and Wales alone, it appears that from 1801 to 1811 the population increased at the rate of fourteen and a half per cent., and from 1811 to 1821, at the rate of sixteen and one third per cent. (Preliminary Observations, p. 32.) At the former of these rates, the period of doubling would be rather above fifty years; at the latter, under forty-six years; and, taking the whole period, the time of doubling would be about forty-eight years. Yet in Great Britain there is a much larger proportion of the population living in towns, and engaged in occupations considered as unhealthy, than in any other known country of the same extent. There are also the best reasons for believing that in no other country of the same extent is there to be found so great a proportion of late marriages, or so great a proportion of persons remaining unmarried, as in Great Britain. It is further known that the number of emigrants from Great Britain greatly exceed those who come into the country. And if, under these circumstances, a demand for labour and an increase of the funds for its maintenance could for twenty years together occasion such a rate of increase as, if continued, would double the population in forty-eight years, and quadruple it in ninety-six years, it is in the highest degree probable, that if the encouragements to marriage and the means of supporting a family were as great as in America, the period of doubling in Great Britain would not be more than twenty-five years, even in spite of her great towns and manufactories; and would be decidedly less if these obstacles were removed.

---

[1] The details which M. Humboldt has given of the population of New Spain are highly interesting, as they are the first of any consequence which the public has yet received of a tropical climate. The peculiarities which mark them are exactly of the kind which might have been expected, though the proportion of births is still greater than we could have ventured to suppose.

The lowest rate of increase that can be assumed for the natural progress of population.

Taking therefore into consideration the actual rate of increase which appears from the best documents to have taken place over a very large extent of country in the United States of America, very variously circumstanced as to healthiness and rapidity of progress; considering, further, the rate of increase which has taken place in New Spain, and also in many countries of Europe, where the means of supporting a family, and other circumstances favourable to increase, bear no comparison with those of the United States; and adverting particularly to the great increase of population which has taken place in this country during the last twenty years, under the formidable obstacles to its progress which must press themselves upon the attention of the most careless observer; it must appear, that the assumption of a rate of increase such as would double the population in twenty-five years, as representing the natural progress of population, when not checked by the difficulty of procuring the means of subsistence, or other peculiar causes of premature mortality, must be very decidedly within the truth.

It may be safely asserted, therefore, that population, when unchecked, increases in a geometrical progression of such a nature as to double itself every twenty-five years.

Different character of the rate of increase in the food of a limited territory.

It would be unquestionably desirable to have the means of comparing the natural rate of the increase of population when unchecked, with the possible rate of the increase of food, in a limited territory, such as that in which man is actually placed; but the latter estimate is much more difficult and uncertain than the former. If the rate of the increase of population at a particular period of some little extent can be ascertained with tolerable exactness, we have only to suppose the continuance of the same encouragements to marriage, the same facility of supporting a family, the same moral habits, with the same rate of mortality; and the increase of the population at the same rate, after it had reached a thousand millions, would be just as probable as at any intermediate and earlier period; but it is quite obvious that the increase of food in a limited space must proceed upon a principle totally different. It has been already stated, that while land of good quality is in great abundance, the rate at which food might be made to increase would far exceed what is necessary to keep pace with the most rapid increase of population which the laws of nature in relation to human kind permit. But if society were so constituted as to give the fullest scope possible to the progress of cultivation and population, all such lands, and all lands of moderate quality, would soon be occupied; and when the future increase of the supply of food came to depend upon the taking of very poor land into cultivation, and the gradual and laborious improvement of the land already cultivated, the rate of the increase of food would certainly have a greater resemblance to a decreasing geometrical ratio than an increasing one. The yearly increment of food would, at any rate, have a constant tendency to diminish, and the amount of the increase of each successive ten years would probably be less than that of the preceding.

Practically, however, great uncertainty must take place. An unfavourable distribution of produce, by prematurely diminishing the demand for labour, might retard the increase of food at an early period, in the same manner as if cultivation and population had been further advanced; while improvements in agriculture, accompanied by a great demand for labour and produce, might for some time occasion a rapid increase of food and population at a later period, in the same manner as if cultivation and population had been in an earlier stage of their progress. These variations, however, obviously arise from causes which do not impeach the general tendency of a continued increase of produce in a limited territory to diminish the power of its increase in future.

Supposition respecting the power of increasing food.

Under this certainty with regard to the general tendency, and uncertainty in reference to particular periods, it must be allowable, if it throws light on the subject, to make a supposition respecting the increase of food in a limited territory, which, without pretending to accuracy, is clearly more favourable to the power of the soil to produce the means of subsistence for an increasing population, than any experience which we have of its qualities will warrant.

If, setting out from a tolerably well-peopled country, such as England, France, Italy, or Germany, we were to suppose that, by great attention to agriculture, its produce could be permanently increased every twenty-five years by a quantity equal to that which it at present produces, it would be allowing a rate of increase decidedly beyond any probability of realization. The most sanguine cultivators could hardly expect that, in the course of the next two hundred years, each farm in this country on an average would produce eight times as much food as it produces at present, and still less that this rate of increase could continue, so that each farm would produce twenty times as much as at present in five hundred years, and forty times as much in a thousand years. Yet this would be but an arithmetical progression, and would fall short, beyond all comparison, of the natural increase of population in a geometrical progression, according to which the inhabitants of any country, in five hundred years, instead of increasing to twenty times, would increase to above a million times their present numbers.

It will be said, perhaps, that many parts of the earth are as yet very thinly peopled, and, under proper management, would allow of a much more rapid increase of food than would be possible in the more fully inhabited states of Europe. This is unquestionably true. Some parts of the earth would no doubt be capable of producing food at such a rate as to keep pace for a few periods with an unrestricted increase of population. But to put this capacity fully into action, is of all things the most difficult. If it is to be accomplished by the improvement of the actual inhabitants of the different parts of the earth in knowledge, in government, in industry, in arts, and in morals, it is scarcely possible to say how it ought to be commenced with the best prospect of success, or to form a conjecture as to the time in which it could be effected.

Insufficiency of emigration.

If it is to be accomplished by emigration from the more improved parts of the world, it is obvious that it must involve much war and extermination; besides all the difficulties usually attendant upon new settlements in uncivilized countries; and these alone are so formidable, and for a long time so destructive, that, combined with the unwillingness which people must always naturally feel to quit their own country, much distress would be suffered at home before relief would be sought for in emigration.

But, supposing for a moment that the object could be fully accomplished, that is, supposing that the capacity of the earth to produce the necessaries of life could be put fully into action, and that they were distributed in the proportions most favourable for the growth of capital and the effective demand for labour, the increase of population, whether arising from the increase of the inhabitants of each country, or from emigrants issuing from all those countries which were more advanced in cultivation, would be so rapid, that, in a period comparatively quite short, all the good lands would be occupied, and the rate of the possible increase of food would be reduced much below the arithmetical ratio above supposed.

If, merely during the short period which has elapsed since our Revolution of 1688, the population of the earth had increased at its natural rate when unchecked, supposing the number of people at that time to have been only eight hundred millions, all the land of the globe, without making allowance for deserts, forests, rocks, and lakes, would on an average be equally populous with England and Wales at present. This would be accomplished in five doublings, or a hundred and twenty-five years; and one or two doublings more, or a period less than that which has elapsed since the beginning of the reign of James I., would produce the same effect from the overflowings of the inhabitants of those countries where, owing to the further progress of cultivation, the soil had not the capacity of producing food so as to keep pace with the increase of an unrestricted population.

Whatever temporary and partial relief, therefore, may be derived from emigration by particular countries in the actual state of things, it is quite obvious, that, considering the subject generally and largely, emigration may be fairly said not in any degree to touch the difficulty. And, whether we exclude or include emigration, whether we refer to particular countries, or to the whole earth, the supposition of a future capacity in the soil to increase the necessaries of life every twenty-five years by a quantity equal to that which is at present produced, must be decidedly beyond the truth.

Effect of the two different rates of increase when brought together.

But if the natural increase of population, when unchecked by the difficulty of procuring the means of subsistence, or other peculiar causes, be such as to continue doubling its numbers in twenty-five years; and the greatest increase of food, which, for a continuance, could possibly take place on a limited territory like our earth in its present state, be at the most only such as would add every twenty-five years an amount equal to its present produce; it is quite clear that a powerful check on the increase of population must be almost constantly in action.

By the laws of nature man cannot live without food. Whatever may be the rate at which population would increase if unchecked, it never can actually increase in any country beyond the food necessary to support it. But, by the laws of nature in respect to the powers of a limited territory, the additions which can be made in equal periods to the food which it produces must, after a short time, either be constantly decreasing, which is what would really take place; or, at the very most, must remain stationary, so as to increase the means of subsistence only in an arithmetical progression. Consequently, it follows necessarily that the average rate of the *actual* increase of population over the greatest part of the globe, obeying the same laws as the increase of food, must be totally of a different character from the rate at which it would increase if *unchecked.*

The great question, then, which remains to be considered, is the manner in which this constant and necessary check upon population practically operates.

General character of the checks to population.

If the soil of any extensive well-peopled country were equally divided amongst its inhabitants, the check would assume its most obvious and simple form. Perhaps each farm in the well-peopled countries of Europe might allow of one, or even two doublings, without much distress, but the absolute impossibility of going on at the same rate is too glaring to escape the most careless thinker. When, by extraordinary efforts, provision had been made for four times the number of persons which the land can support at present, what possible hope could there be of doubling the provision in the next twenty-five years?

Yet there is no reason whatever to suppose that any thing besides the difficulty of procuring in adequate plenty the necessaries of life, should either indispose this greater number of persons to marry early, or disable them from rearing in health the largest families. But this difficulty would of necessity occur, and its effect would be either to discourage early marriages, which would check the rate of increase by preventing the same proportion of births; or to render the children unhealthy from bad and insufficient nourishment, which would check the rate of increase by occasioning a greater proportion of deaths; or, what is most likely to happen, the rate of increase would be checked, partly by the diminution of births, and partly by the increase of mortality.

The first of these checks may, with propriety, be called the *preventive check* to population; the second, the *positive check;* and the absolute necessity of their operation in the case supposed is as certain and obvious as that man cannot live without food.

Taking a single farm only into consideration, no man would have the hardihood to assert that its produce could be made permanently to keep pace with a population increasing at such a rate as it is observed to do for twenty or thirty years together at particular times and in particular countries. He would, indeed, be compelled to acknowledge, that if, with a view to allow for the most sanguine speculations, it has been supposed that the additions made to the necessaries produced by the soil in given times might remain constant, yet that this rate of the increase of produce could not possibly be realized; and that, if the capacity of the soil were at all times put properly into action, the additions to the produce would, after a short time, and independently of new inventions, be constantly decreasing, till, in no very long period, the exertions of an additional labourer would not produce his own subsistence.

But what is true in this respect in reference to a single farm, must necessarily be true of the whole earth, from which the necessaries of life for the actual population are derived. And what would be true in respect to the checks to population if the soil of the earth were equally divided among the different families which inhabit it, must be true under the present unequal division of property and variety of occupations. Nothing but the confusion and indistinctness arising from the largeness of the subject, and the vague and false notions which prevail respecting the efficacy of emigration, could make persons deny in the case of an extensive territory or the whole earth, what they could not fail to acknowledge in the case of a single farm, which may be said fairly to represent it.

It may be expected, indeed, that in civilized and improved countries the accumulation of capital, the division of labour, and the invention of machinery, will extend the bounds of production; but we know from experience that the effects of these causes, which are quite astonishing in reference to some of the conveniences and luxuries of life, are very much less efficient in producing an increase of food; and although the saving of labour and an improved system of husbandry may be the means of pushing cultivation upon much poorer lands than could otherwise be worked, yet the increased quantity of the necessaries of life so obtained can never be such as to supersede, for any length of time, the operation of the preventive and positive checks to population. And not only are these checks as absolutely necessary in civilized and improved countries, as they would be if each family had a certain portion of land allotted to it, but they operate almost exactly in the same way. The distress which would obviously arise in the most simple state of society, from the natural tendency of population to increase faster than the means of subsistence in a limited territory, is brought home to the higher classes of an improved and populous country, in the difficulty which they find in supporting their families in the same rank of life with themselves; and to the labouring classes, which form the great mass of society, in the insufficiency of the real wages of common labour to bring up a large family.

If in any country the yearly earnings of the commonest labourers, determined, as they always will be, by the state of the demand and the supply of necessaries compared with labour, be not sufficient to bring up in health the largest families, one of the three things before stated must happen; either the prospect of this difficulty will prevent some and delay other marriages; or the diseases arising from bad nourishment will be introduced, and the mortality be increased; or the progress of population will be retarded, partly by one cause and partly by the other.

Of the effect of private property on the progress of population.

According to all past experience, and the best observations which can be made on the motives which operate upon the human mind, there can be no well-founded hope of obtaining a large produce from the soil, but under a system of private property. It seems perfectly visionary to suppose that any stimulus short of that which is excited in man by the desire of providing for himself and family, and of bettering his condition in life, should operate on the mass of society with sufficient force and constancy to overcome the natural indolence of mankind. All the attempts which have been made since the commencement of authentic history to proceed upon a principle of common property, have either been so insignificant that no inference can be drawn from them, or have been marked by the most signal failures; and the changes which have been effected in modern times by education do not seem to advance a single step towards making such a state of things more probable in future. We may therefore safely conclude, that while man retains the same physical and moral constitution which he is observed to possess at present, no other than a system of private property stands the least chance of providing for such a large and increasing population as that which is to be found in many countries at present.

But though there is scarcely any conclusion which seems more completely established by experience than this, yet it is unquestionably true that the laws of private property, which are the grand stimulants to production, do themselves so limit it, as always to make the actual produce of the earth fall very considerably short of the *power* of production. On a system of private property no adequate motive to the extension of cultivation can exist, unless the returns are sufficient, not only to pay the wages necessary to keep up the population, which, at the least, must include the support of a wife and two or three children, but also afford a profit on the capital which has been employed. This necessarily excludes from cultivation a considerable portion of land, which might be made to bear corn. If it were possible to suppose that man might be adequately stimulated to labour under a system of common property, such land might be cultivated, and the production of food and the increase of population might go on, till the soil absolutely refused to grow a single additional quarter, and the whole of the society was exclusively engaged in procuring the necessaries of life. But it is quite obvious that such a state of things would inevitably lead to the greatest degree of distress and degradation. And if a system of private property secures mankind from such evils, which it certainly does in a great degree, by securing to a portion of the society the leisure necessary for the progress of the arts and sciences, it must be allowed that such a check to the increase of cultivation confers on society a most signal benefit.

But it must perhaps also be allowed, that, under a system of private property, cultivation is sometimes checked in a degree and at a period not required by the interest of society. And this is particularly likely to happen when the original divisions of land have been extremely unequal, and the laws have not given sufficient facility to a better distribution of them. Under a system of private property, the only effectual demand for produce must come from the owners of property; and though it be true that the effectual demand of the society, whatever it may be, is best supplied under the most perfect system of liberty, yet it is not true that the tastes and wants of the effective demanders are always, and necessarily, the most favourable to the progress of national wealth. A taste for hunting and the preservation of game among the owners of the soil will, without fail, be supplied, if things be allowed to take their natural course; but such a supply, from the manner in which it must be effected, would inevitably be most unfavourable to the increase of produce and population. In the same manner, the want of an adequate taste for the consumption of manufactured commodities among the possessors of surplus produce, if not fully compensated by a great desire for personal attendance, which it never is, would infallibly occasion a premature slackness in the demand for labour and produce, a premature fall of profits, and a check to cultivation.

It makes little difference in the actual rate of the increase of population, or the necessary existence of checks to it, whether that state of demand and supply which occasions an insufficiency of wages to the whole of the labouring classes be produced prematurely by a bad structure of society and an unfavourable distribution of wealth, or necessarily by the comparative exhaustion of the soil. The labourer feels the difficulty nearly in the same degree, and it must have nearly the same results, from whatever cause it arises; consequently, in every country with which we are acquainted, where the yearly earnings of the labouring classes are not sufficient to bring up in health the largest families, it may be safely said that population is actually checked by the difficulty of procuring the means of subsistence. And, as we well know that ample wages, combined with full employment for all who choose to work, are extremely rare, and scarcely ever occur, except for a certain time, when the knowledge and industry of an old country is applied, under favourable circumstances, to a new one; it follows that the pressure arising from the difficulty of procuring subsistence is not to be considered as a remote one, which will be felt only when the earth refuses to produce any more, but as one which not only actually exists at present over the greatest part of the globe, but, with few exceptions, has been almost constantly acting upon all the countries of which we have any account.

It is unquestionably true, that, in no country of the globe have the government, the distribution of property, and the habits of the people, been such as to call forth, in the most effective manner, the resources of the soil. Consequently, if the most advantageous possible change in all these respects could be supposed at once to take place, it is certain that the demand for labour and the encouragement to production might be such as for a short time in some countries, and for rather a longer in others, to lessen the operation of the checks to population which have been described. It is specifically this truth constantly obtruding itself upon our attention which is the great source of delusion on this subject, and creates the belief that man could always produce from the soil much more than sufficient to support himself and family. In the actual state of things this power has perhaps always been possessed. But for it we are indebted wholly to the ignorance and bad government of our ancestors. If they had properly called forth the resources of the soil, it is quite certain that we should now have but scanty means left of further increasing our food. If merely since the time of William the Conqueror all the nations of the earth had been well governed, and if the distribution of property, and the habits both of the rich and the poor, had been the most favourable to the demand for produce and labour, though the amount of food and population would have been prodigiously greater than at present, the means of diminishing the checks to population would unquestionably be less. That difficulty in procuring the necessaries of life which is now felt in the comparatively low wages of labour almost all over the world, and is occasioned partly by the necessary state of the soil, and partly by a premature check to the demand for produce and labour, would then be felt in a greater degree, and would less admit of any relaxation in the checks to population, because it would be occasioned wholly and necessarily by the state of the soil.

The laws of nature responsible for the necessity of checks to population.

It appears, then, that what may be called the proportionate amount of the necessary checks to population depends very little upon the efforts of man in the cultivation of the soil. If these efforts had been directed from the first in the most enlightened and efficient manner, the checks necessary to keep the population on a level with the means of subsistence, so far from being lightened, would in all probability be operating with greater force; and the condition of the labouring classes, so far as it depends on the facility of procuring the means of subsistence, instead of being improved, would in all probability be deteriorated.

It is to the laws of nature, therefore, and not to the conduct and institutions of man, that we are to attribute the necessity of a strong check on the natural increase of population.

Man responsible for the prevailing character of these checks.

But though the laws of nature which determine the rate at which population would increase if unchecked, and the very different rate at which the food required to support population could be made to increase in a limited territory, are undoubtedly the causes which render necessary the existence of some great and constant check to population, yet a vast mass of responsibility remains behind on man and the institutions of society.

In the first place, they are certainly responsible for the present scanty population of the earth. There are few large countries, however advanced in improvement, the population of which might not have been doubled or tripled, and there are many which might be ten, or even a hundred times as populous, and yet all the inhabitants be as well provided for as they are now, if the institutions of society and the moral habits of the people had been for some hundred years the most favourable to the increase of capital, and the demand for produce and labour.

Secondly, though man has but a trifling and temporary influence in altering the proportionate amount of the checks to population, or the degree in which they press upon the actual numbers, yet he has a great and most extensive influence on their character and mode of operation.

It is not in superseding the necessity of checks to population, in the progress of mankind to the full peopling of the earth (which may with truth be said to be a physical impossibility), but in directing these checks in such a way as to be the least prejudicial to the virtue and happiness of society, that government and human institutions produce their great effect. Here we know, from constant experience, that they have great power. Yet even here it must be allowed that the power of government is rather indirect than direct, as the object to be attained depends mainly upon such a conduct on the part of individuals as can seldom be directly enforced by laws, though it may be powerfully influenced by them.

This will appear if we consider more particularly the nature of those checks which have been classed under the general heads of Preventive and Positive.

It will be found that they are all resolvable into *moral restraint*, *vice*, and *misery*. And if, from the laws of nature, some check to the increase of population be absolutely inevitable, and human institutions have any influence upon the extent to which each of these checks operates, a heavy responsibility will be incurred, if all that influence, whether direct or indirect, be not exerted to diminish the amount of vice and misery.

These checks resolvable into moral restraint, vice, and misery.

Moral restraint, in application to the present subject, may be defined to be, abstinence from marriage, either for a time or permanently, from prudential considerations, with a strictly moral conduct towards the sex in the interval. And this is the only mode of keeping population on a level with the means of subsistence, which is perfectly consistent with virtue and happiness. All other checks, whether of the preventive or the positive kind, though they may greatly vary in degree, resolve themselves into some form of vice or misery.

The remaining checks of the preventive kind, are the sort of intercourse which renders some of the women of large towns unprolific; a general corruption of morals with regard to the sex, which has a similar effect; unnatural passions, and improper arts to prevent the consequences of irregular connections. These evidently come under the head of vice.

The positive checks to population include all the causes which tend in any way prematurely to shorten the duration of human life; such as unwholesome occupations, severe labour and exposure to the seasons, bad and insufficient food and clothing, arising from poverty, bad nursing of children, excesses of all kinds, great towns and manufactories, the whole train of common diseases and epidemics, wars, infanticide, plague, and famine. Of these positive checks, those which appear to arise from the laws of nature may be called exclusively misery; and those which we bring upon ourselves, such as wars, excesses of all kinds, and many others, which it would be in our power to avoid, are of a mixed nature. They are brought upon us by vice, and their consequences are misery.

Some of these checks, in various combinations, and operating with various force, are constantly in action in all the countries with which we are acquainted, and form the immediate causes which keep the population on a level with the means of subsistence.

Mr Malthus, in his work on this subject, has taken a view of the checks of population in most of the countries of which we have the best accounts. His object was evidently to trace in each country those checks which appeared to be most effective in repressing population; and to endeavour to answer the question generally which had been applied particularly to New Holland by Captain Cook, namely, By what means is the population of this country kept down to the number which it can subsist?

Prudential restraint on marriage.

It was hardly to be expected, however, that the general accounts of countries which are to be met with should contain a sufficient number of details of the kind required to enable us to ascertain what portion of the natural increase of population each individual check which could be traced had the power to overcome. In particular, it was not to be expected, that any accounts could inform us of the degree in which moral restraint prevails when taken in its strictest sense. It is necessary, therefore, to attend chiefly to the greater or smaller number of persons who remain unmarried, or marry late; and the delay of marriage, owing to the difficulty of providing for a family, when the degree of irregularity to which it may lead cannot be ascertained, may be usefully called the prudential restraint on marriage and population. And this will be found to be the chief mode in which the preventive check practically operates.

But if the preventive check to population, that check which can alone supersede great misery and mortality, operates chiefly by a prudential restraint on marriage, it will be obvious, as was before stated, that direct legislation cannot do much. Prudence cannot be enforced by laws, with-

Causes which principally affect the habits of the labouring classes.

out a great violation of natural liberty, and a great risk of producing more evil than good. But still the very great influence of a just and enlightened government, and the perfect security of property in creating habits of prudence, cannot for a moment be questioned. The principal causes and effects of these habits are thus stated in Mr Malthus's last work.[1]

"From high wages, or the power of commanding a large portion of the necessaries of life, two very different results may follow; one, that of a rapid increase of population, in which case the high wages are chiefly spent in the maintenance of large and frequent families; and the other, that of a decided improvement in the modes of subsistence, and the conveniences and comforts enjoyed, without a proportionate acceleration in the rate of increase.

"In looking to these different results, the causes of them will evidently appear to be the different habits existing among the people of different countries, and at different times. In an inquiry into the causes of these different habits, we shall generally be able to trace those which produce the first result to all the circumstances which contribute to depress the lower classes of the people, which make them unable or unwilling to reason from the past to the future, and ready to acquiesce, for the sake of present gratification, in a very low standard of comfort and respectability; and those which produce the second result, to all the circumstances which tend to elevate the character of the lower classes of society, which make them approach the nearest to beings who "look before and after," and who, consequently, cannot acquiesce patiently in the thought of depriving themselves and their children of the means of being respectable, virtuous, and happy.

"Among the circumstances which contribute to the character first described, the most efficient will be found to be despotism, oppression, and ignorance; among those which contribute to the latter character, civil and political liberty, and education.

"Of all the causes which tend to encourage prudential habits among the lower classes of society, the most essential is unquestionably civil liberty. No people can be much accustomed to form plans for the future, who do not feel assured that their industrious exertions, while fair and honourable, will be allowed to have free scope; and that the property which they either possess or may acquire will be secured to them by a known code of just laws impartially administered. But it has been found by experience, that civil liberty cannot be permanently secured without political liberty; consequently political liberty becomes almost equally essential, and, in addition to its being necessary in this point of view, its obvious tendency to teach the lower classes of society to respect themselves, by obliging the higher classes to respect them, must contribute greatly to all the good effects of civil liberty."

"With regard to education, it might certainly be made general under a bad form of government, and might be very deficient under one in other respects good; but it must be allowed that the chances, both with regard to its quality and its prevalence, are greatly in favour of the latter. Education alone could do little against insecurity of property; but it would powerfully assist all the favourable consequences to be expected from civil and political liberty, which could not indeed be considered as complete without it."

The varying prevalence of these habits, owing to the causes above referred to, combined with the smaller or greater mortality occasioned by other customs, and the varying effects of soil and climate, must necessarily produce great differences in different countries, and at different periods, in the character of the predominant checks to population, and the force of each. And this inference, which inevitably follows from theory, is fully confirmed by experience.

The positive checks to population predominated in ancient times.

It appears, for instance, from the accounts we have received of ancient nations, and of the less civilized parts of the world, that war and violent diseases were the predominant checks to their population. The frequency of wars, and the dreadful devastations of mankind occasioned by them, united with the plagues, famines, and mortal epidemics of which there are records, must have caused such a consumption of the human species, that the exertion of the utmost power of increase must, in many cases, have been insufficient to supply it; and we see at once the source of those encouragements to marriage, and efforts to increase population, which, with inconsiderable exceptions, distinguished the legislation and general policy of ancient times. Yet there were some few men of more extended views, who, when they were looking to the settlement of a society in a more improved state, were fully aware, that under the most beautiful form of government which their imagination could conceive, the greatest poverty and distress might be felt from a too rapid increase of population. And the remedies which they proposed were strong and violent in proportion to the greatness of the evil which they apprehended. Even the practical legislators who encouraged marriage, seemed to think that the supplies of children might sometimes follow too rapidly for the means of supporting them; and it appears to have been with a view to provide against this difficulty, and of preventing it from discouraging marriage, that they frequently sanctioned the inhuman practice of infanticide.

Under these circumstances, it is not to be supposed that the prudential restraint on marriage should have operated to any considerable extent. Except in a few cases where a general corruption of morals prevailed, which might act as a preventive check of the most vicious kind, a large portion of the procreative power was called into action, the occasional redundancy from which was checked by violent causes. These causes will be found resolvable almost wholly into vice and misery; the first of which, and a large portion of the second, it is always in the power of man to avoid.

Prudential restraint the predominant check to population in modern times.

In a review of the checks to population in the different states of modern Europe, it appears that the positive checks to population have prevailed less, and the preventive checks more, than in ancient times, and in the more uncultivated parts of the world. The destruction occasioned by war has unquestionably abated, both on account of its occurring, on the whole, less frequently, and its ravages not being so fatal, either to man or the means of his support, as they were formerly. And although, in the earlier periods of the history of modern Europe, plagues, famines, and mortal epidemics were not unfrequent, yet, as civilization and improvement have advanced, both their frequency and their mortality have been greatly reduced, and in some countries they are now almost unknown. This diminution of the positive checks to population, as it has been certainly much greater in proportion than the actual increase of food and population, must necessarily have been accompanied by an increasing operation of the preventive checks; and probably it may be said with truth, that in almost all the more improved countries of modern Europe, the principal check which at present keeps the population down to the level of the actual means of subsistence, is the prudential restraint on marriage.

Yet in comparing together the accounts and registers of the different countries of modern times, we shall still find a vast difference in the character and force of the checks which are mainly in action; and it is precisely in this point

---

[1] Principles of Political Economy, c. iv. sect. 2.

Difference in the character and force of the checks in different countries.

of view that these accounts afford the most important instruction. Some parts of Europe are yet in an unimproved state, and are still subject to frequent plagues and mortal epidemics. In these countries, as might be expected, few traces are to be found of the prudential restraint on marriage. But even in improved countries, the circumstances may be such as to occasion a great mortality. Large towns are known to be unfavourable to health, particularly to the health of young children; and the unwholesomeness of marshy situations may be such as in some cases to balance the principle of increase, even when nearly the whole of the procreative power is called into action, which is seldom the case in large towns.

Thus, in the registers of twenty-two Dutch villages given by Sussmilch,[1] and quoted by Mr Malthus, the mortality (occasioned, as may be supposed, chiefly by the natural unhealthiness of the country) was as high as one in twenty-two or twenty-three, instead of the more common proportion of one in thirty-five or forty; and the consequence was, that the marriages, instead of being in the usual proportion of one in about 108 of the population, were in the extraordinary high proportion of one in sixty-four;[2] showing a most unusual frequency of marriage, while, on account of the great mortality, the number of inhabitants was nearly stationary, and the births and deaths about equal.

On the other hand, in Norway, where the climate and modes of living seem to be extremely favourable to health, and the mortality was only one in forty-eight, the prudential restraint on marriage was called more than usually into action, and the marriages were only one in 130 of the population.

Gradual diminution in the proportion of marriages.

These may be considered as extreme cases, but the same result in different degrees is observable in the registers of all countries; and it is particularly to be remarked, that in those countries where registers of births, deaths, and marriages have been kept for a considerable time, the progressive diminution or mortality occasioned by the introduction of habits more favourable to health, and the consequent diminution of plagues and mortal epidemics, have been accompanied invariably by a smaller proportion of marriages and births. Sussmilch has given some striking instances of the gradual diminution in the proportion of the number of marriages during a part of the last century.[3]

In the town of Leipsic, in the year 1620, the annual marriages were to the population as 1 to 82; from the year 1741 to 1756, they were as 1 to 120.

In Augsburg, in 1510, the proportion of marriages to the population was 1 in 86; in 1750 as 1 to 123.

In Dantzic, in the year 1705, the proportion was as 1 to 89; in 1745, as 1 to 118.

In the dukedom of Magdeburg, in 1700, the proportion was as 1 to 87; from 1752 to 1755, as 1 to 125.

In the principality of Halberstadt, in 1690, the proportion was as 1 to 88; in 1756, as 1 to 112.

In the dukedom of Cleves, in 1705, the proportion was as 1 to 83; in 1755, as 1 to 100.

In the churmark of Brandenburg, in 1700, the proportion was as 1 to 76; and in 1755, as 1 to 108.

Instances of this kind are numerous, and they tend to show the dependence of the marriages on the deaths in all old countries. A greater mortality almost invariably produces a greater number of marriages; and it must be equally certain, that except where the means of subsistence can be adequately increased, a greater proportion of marriages must occasion a greater mortality.

Dependence of the births and marriages on the deaths.

The proportion of yearly births to the whole population must evidently depend principally on the proportion of marriages; and it appears, consequently, from registers, that in countries which will not admit of any considerable increase of population, the births, as well as the marriages, are mainly influenced by the deaths. When an actual decrease of population is not taking place, the births will always supply the vacancies made by death, and exactly so much more as the increasing wealth of the country and the demand for labour will admit. Everywhere in the intervals of plagues, epidemics, and destructive wars, the births considerably exceed the deaths; but while from these and other causes the mortality in different countries is extremely various, it appears from registers that, with the exception above stated, the births vary in the same proportion.[4]

Thus, in 39 villages of Holland, where the deaths, at the time to which the registers refer, were about 1 in 23, the births were also 1 in 23. In 15 villages round Paris, the births bore the same or even a greater proportion to the whole population, on account of a still greater mortality, the births being 1 in $22\frac{7}{10}$ths, and the deaths the same. In the small towns of Brandenburg, which were in an increasing state, the mortality was 1 in 29, and the births 1 in $24\frac{7}{10}$ths. In Sweden, where the mortality was about 1 in $34\frac{1}{2}$, the births were 1 in 28. In 1056 villages of Brandenburg, in which the mortality was about 1 in 39 or 40, the births were about 1 in 30. In Norway, where the mortality was 1 in 48, the births were 1 in 34.

In all these instances the births are evidently measured by the deaths, after making a proper allowance for the excess of births which the state of each country will admit. In such a country as Russia, this allowance must be great; as, although the mortality might perhaps be taken as low as 1 in 48 or 50, the births were as high as 1 in 26, owing to the increasing resources of the country, which admit of a rapid increase of the population.

Dependence of the births on the deaths illustrated in Switzerland.

Of all the countries which Mr Malthus has reviewed, there is none which so strikingly illustrates the most important fact of the dependence of the proportions of marriages and births on the deaths, and the general principles of population, as Switzerland. It appears, that between 1760 and 1770, an alarm prevailed respecting the continued depopulation of the country; and, to ascertain the point, M. Muret, minister of Vevay, made a very laborious and careful search into the registers of different parishes from the time of their first establishment. He compared the number of births which had taken place during three different periods of seventy years each, the first ending in 1620, the second in 1690, and the third in 1760. And finding by this comparison, that the number of births was less in the second period than in the first, and less in the third period than in the second, he considered the evidence of a continued depopulation of the country from the year 1550 as incontrovertible.[5] But the accounts which he himself produces clearly show, that, in the earlier periods to which he refers, the mortality was very much greater than in the latter; and that the greater *number* of births found in the registers formerly, was not owing to a greater population, but to the greater *proportion* of births which always accompanies a greater mortality.

It appears from accounts which are entirely to be depended on, that during the last period the mortality was extraordinarily small, and the proportion of children reared from infancy to puberty extraordinarily great. At the time when M. Muret wrote his paper, in 1766, the proportion of deaths to the population in the Pays de Vaud was 1 in 45, of births 1 in 36, and of marriages 1 in 140. These are all very small proportions of births, deaths, and marriages, compared with other countries; but the state of things must have been totally different in the sixteenth and seventeenth centuries. M. Muret gives a list of all the plagues which had prevailed in Switzerland from 1520, from which it appears that this dreadful scourge desolated the country at short intervals during the whole of the first period, and extended its occasional ravages to within twenty-two years of the termination of the second. We may safely conclude, that, in these times, the average mortality was very much greater than at present. But what puts the question beyond a doubt, is the great mortality which prevailed in the neighbouring town of Geneva in the sixteenth century, and its gradual diminution in the seventeenth and eighteenth. It appears from calculations, published in the *Bibliothèque Britannique* (tom. iv. p. 328), that in the sixteenth century the probability of life, or the age to which half of the born lived, was only 4·883, or under four years and eleven months; and the mean life, or the average number of years due to each person, 18·511, or about eighteen years and a half. In the seventeenth century, the probability of life in Geneva was 11·607, about eleven years and seven months; the mean life 23·358, or twenty three years and four months. In the eighteenth century, the probability of life had increased to 27·183, twenty-seven years and two months; and the mean life to thirty-two years and two months.

[5] *Mémoires, &c. par la Société Economique de Berne*, 1766, pp. 15 *et seq.* Essay on Population, vol. i. pp. 464 *et seq.* fifth edition.

There can be no doubt, from the prevalence of the plague, and its gradual extinction, as noticed by M. Muret, that a diminution of mortality of the same kind, though not perhaps to the same extent, must have taken place in Switzerland; but if, with a mortality which could not have been less than one in thirty or thirty-two, the proportion of births had been what it was when M. Muret wrote, it is quite evident that the country would have been rapidly depopulated. But as it is known, from the actual amount of births found in the registers, that this was not the case, it follows as a necessary consequence, that the greater mortality of former times was accompanied by a greater proportion of births. And this at once shows the error of attempting to determine the actual population, either of different countries, or of different periods in the same country, by the amount of the births; and the strong tendency of population to fill up all vacancies, and very rarely to be limited by any other cause than the difficulty of supporting a family.

Swizerland and the Pays de Vaud afford other most striking instances of the dependence of the births on the deaths; and the accounts of them are perhaps more to be depended upon, as they appear to contradict the preconceived opinions of the person who collected them.

Speaking of the want of fruitfulness in the Swiss women, M. Muret says, that Prussia, Brandenburg, Sweden, France, and indeed every country the registers of which he had seen, give a greater proportion of baptisms to the number of inhabitants than the Pays de Vaud, where this proportion is only as 1 to 36. He adds, that from calculations lately made in the Lyonnois, it appeared that in Lyons itself the proportion of baptisms was 1 in 28, in the small towns 1 in 25, and in the villages 1 in 23 or 24. What a prodigious difference, he exclaims, between the Lyonnois and the Pays de Vaud, where the most favourable proportion, and that only in two small parishes of extraordinary fecundity, is not above 1 in 26, and in many parishes it is considerably less than 1 in 40 The same difference, he remarks, takes place in the mean life. In the Lyonnois it is little above 25 years; while in the Pays de Vaud, the lowest mean life, and that only in a single marshy and unhealthy parish, is 29½ years, and in many places it is above 45 years.

"But whence comes it," he says, "that the country where children escape the best from the dangers of infancy, and where the mean life, in whatever way the calculation is made, is higher than in any other, should be precisely that in which the fecundity is the smallest? How comes it, again, that, of all our parishes, the one which gives the mean life the highest should also be the one where the tendency to increase is the smallest?"[1]

To resolve this question, M. Muret says, "I will hazard a conjecture, which, however, I give only as such. Is it not that, in order to maintain in all places a proper equilibrium of population, God has wisely ordered things in such a manner as that the force of life in each country should be in the inverse ratio of its fecundity? In fact, experience verifies my conjecture. Leyzin, a village in the Alps, with a population of 400 persons, produces but a little above eight children a year. The Pays de Vaud, in general, in proportion to the same number of inhabitants, produces eleven, and the Lyonnois sixteen. But if it happen, that at the age of twenty years, the eight, the eleven, and the sixteen are reduced to the same number, it will appear that the force of life gives in one place what fecundity does in another. And thus the most healthy countries, having less fecundity, will not over-people themselves, and the unhealthy countries, by their extraordinary fecundity, will be able to sustain their population."

These facts and observations are full of the most important instruction, and strikingly illustrate the principle of population. The three gradations in the proportions of births which are here so distinctly presented to our view, may be considered as representing that variety in the proportion of births which is known to take place in different countries and at different periods; and the practical question is, whether, when this variety prevails without a proportionate difference in the rate of increase, which is almost universally the case, we are to suppose, with M. Muret, that a special providence is called into action to render women less prolific in healthy countries, and where improved habits of cleanliness have banished plagues and mortal epidemics; or to suppose, as experience warrants, that the smaller mortality of healthy and improved countries is balanced by the greater prevalence of the prudential restraint on marriage and population.

The subject is seen with particular clearness in Switzerland, on account of the population of some of the districts being stationary. The number of inhabitants on the Alps was supposed to have diminished. This was probably an error; but it is not improbable that they should have remained stationary, or nearly so. There is no land so little capable of providing for an increasing population as mountainous pastures. When they have been once fully stocked with cattle, little more can be done; and if there be neither emigration to take off the superabundant numbers, nor manufactures wherewith to purchase an additional quantity of food, the deaths must equal the births.

This was the case with the Alpine parish of Leyzin before referred to, where, for a period of thirty years, the mortality and the proportion of births almost accurately kept pace with each other; and where, in consequence, if the positive checks to population had been unusually small, the preventive checks must have been unusually great. In the parish of Leyzin, according to M. Muret, the probability of life was as high as sixty-one years;[2] but it is obvious that this extraordinary degree of healthiness could not *possibly* have taken place under the actual circumstances of the parish with respect to the means of subsistence, if it had not been accompanied by a proportionate action of the prudential restraint on marriage; and accordingly the subsisting marriages, being late and unprolific, yielded only one birth to every twelve; the births were only one in forty-nine, and the number of persons below sixteen was only one fourth of the population.

---

[1] *Mémoires, &c. par la Société Economique de Berne*, 1766, pp. 48 *et seq.*

[2] *Ibid.* table v. p. 65 of the tables.

There can be little doubt that in the present case the extreme healthiness of the people, arising from their situation and employments, had more effect in producing the prudential check to population than the prudential check in producing the extreme healthiness; yet it is quite certain that they must constantly act and re-act upon each other, and that if, when the circumstances are such as to furnish no adequate means for the support of an increased population, and no relief in emigration, the prudential check does not prevail, no degree of natural healthiness could prevent an excessive mortality. Yet to occasion such a mortality, a much greater degree of poverty and misery must have taken place than in districts less favourably circumstanced with regard to health; and we see at once the reason why, in countries of mountainous pasture, if there be no vent in emigration, the necessity of the prudential check should be more strongly forced on the attention of the inhabitants, and should in consequence prevail to a greater degree.

Differences in the registers of different countries.

Taking countries in general, there will necessarily be differences as to natural healthiness in all the gradations, from the most marshy habitable situations to the most pure and salubrious air. These differences will be further increased by the nature of the employments of the people, their habits of cleanliness, and their care in preventing the spread of epidemics. If in no country was there any difficulty in obtaining the means of subsistence, these different degrees of healthiness would make a great difference in the progress of population; and as there are many countries naturally more healthy than the United States of America, we should have instances of a more rapid increase than that which has there taken place. But as the actual progress of population is, with very few exceptions, determined by the relative difficulty of procuring the means of subsistence, and not by the relative natural powers of increase, it is found by experience that, except in extreme cases, the actual progress of population is little affected by unhealthiness or healthiness; but that these circumstances show themselves most powerfully in the character of the checks which keep the population down to the level of the means of subsistence, and occasion that sort of variety in the registers of different countries which was noticed in the instances mentioned by M. Muret.

Thus the population of two or three countries may be increasing at nearly the same rate, but one may be increasing chiefly from a great proportion of births, another from a small proportion of deaths, and a third from a more common proportion of both, in which three different cases the structure of the population, and the registers of births, deaths, and marriages, will be essentially different.

The rate at which the population of Sweden and Norway was increasing, at the time referred to by Mr Malthus, was not far from the same; but their registers differed in almost all points. While the births in Sweden were 1 in 28 of the population, the births in Norway were only 1 in 34; while the marriages in Sweden were 1 in 112, in Norway they were only 1 in 130; and while the mortality in Sweden was 1 in 34½, in Norway it was only 1 in 48.[1] These different proportions of births, deaths, and marriages, must essentially alter the whole structure of the population. The proportion of persons living at different ages would be essentially different; the generations in one country would pass away sooner than the generations in the other; and Sweden might be said to increase principally from the large proportion of its births, and Norway from the small proportion of its deaths, or its small mortality.

A large proportion of births, when they have room to expand themselves, is the most powerful element of increase, and is absolutely necessary in order to effect the shortest period of doubling with which we are acquainted; but two countries may have nearly the same proportion of births, and yet the population of one be quite stationary, while the population of the other is increasing with the greatest known rapidity. The proportion of births in the Dutch villages first noticed approaches towards that of the United States of America; yet in the one case the population did not increase at all, and in the other it has increased so fast as to be taken as a specimen of the natural progress of population when interrupted by the fewest checks to which human society is subject. In this case, though the proportions of births and marriages to the whole population might not be very unlike, and possibly no very great difference might appear in the proportion of marriages to births, the other points in the registers would be in the opposite extremes. While the mortality in the Dutch villages was as high as 1 in 22, it would probably be 1 in 41, or less, in the United States. While the births and deaths in the Dutch villages were in the ratio of equality, in the United States they would be nearly in the proportion of 41 to 19.

In the same manner, two countries might have nearly the same mortality, and yet, in other points, be very different; and while one was increasing most rapidly, the other might be increasing very slowly. The proportion of deaths to the population in the Pays de Vaud is not very essentially different from that of the United States, but the proportion of births and the structure of the population present the most striking contrasts. The proportion of births for the whole of the Pays de Vaud was, according to M. Muret, 1 in 36, in many parishes it was considerably less than 1 in 40, and in one parish as low as 1 in 49; while, in the United States, it must be somewhere between 1 in 19 and 1 in 20. The structure of the population was different accordingly. In the whole of the Pays de Vaud, the proportion of the population under sixteen was one third; in many parts, and in the whole of the Canton of Berne, one fourth; while in the United States, it is as high as one half.

Variations in the age to which half of the born live in different countries.

We have seen, that, according to M. Muret, the probability of life, or the age to which half the born live, was, in the extraordinary parish of Leyzin, as high as 61 years. On the same authority, it appears that in nine other parishes of the Alps it was as high as 47; in 41 parishes of the Pays de Vaud and Jura 42; in 12 corn parishes 40; in 18 parishes among the great vineyards 37, in one marshy parish 24.[2] From other authorities we learn, that in country villages and parishes, the age to which half of the born live is such, that the major part will probably live to marry.[3] In the parish of Ackworth, in Yorkshire, it appears from an exact account kept by Dr Lee, of the ages at which all died there for twenty years from 1747 to 1767, that half the inhabitants live to the age of 46 (Price, vol. ii. p. 35, 7th edit.); and if the same account had been kept in many of the other healthy parishes in England, where the yearly mortality, instead of being 1 in 47 as in Ackworth, was 1 in 60, 1 in 66, and even 1 in 75 (vol. ii. p. 224), half of the born would be found to have lived to above 50 or 55. In the whole of Sweden, where the annual mortality, at the time referred to by Dr Price, was greater than 1 in 35, it appears from his tables, that half of the born must have lived to above 33 (vol. ii. p. 413, 7th edit.); and in Great Britain generally, where the mortality at present, after making due allowance for the omissions in the deaths, appears to be less than 1 in 51, it cannot be doubted that there is scarcely a village in the country tolerably well situated, where half of the born do not live till above 40. In towns the case is very different. According to the data collected by Dr Price, one half of the born died in London under three years of age, in Vienna and Stockholm under two, in Manchester under five, in Northampton under ten (vol. ii. p. 33); and although in most of these towns, particularly those in England, a great improvement has taken place in their healthiness of late years, yet still they will always fall far short of the healthiness of country situations.

---

[1] See Malthus on Population, chapters i. and ii. of book ii.

[2] *Mémoires, &c. par la Société Economique de Berne*, 1766, table viii. p. 92 of the tables. As these calculations seem all to have been made from mortuary registers, they are all too low, except where the population was absolutely stationary.

[3] Graunt's and Short's Observations, &c. referred to by Dr Price, vol. ii. pp. 41, 42, &c. 7th edition.

The age to which half the born live appears, therefore, to vary in different countries and places, and under different circumstances, in the very extraordinary degree of from 3 to 60.[1]

Variations n the ex- ectation f life in lifferent ountries.

The mean age of death, or the expectation of life, must necessarily be more steady; yet it appears to vary from about 16 or 17 to 50.

In Stockholm, according to a table calculated by Dr Price, from the medium of three different enumerations in 1757, 1760, and 1763, the expectation of life for males at birth was 14·25, and for females 18·10.[2] Taken together, the expectation of life was a little above 16. In Vienna, as appears from another table, it was 16½.[3] While, according to M. Muret, at Leyzin, the expectation of life at birth was, about the same period, 50 years.[4]

ariations the an- ual mor- lity.

The annual mortality, which is different, both from the age to which half of the born live, and the mean age of death, is found to vary in different places and countries, from about 1 in 19 to about 1 in 70. In Stockholm, the annual mortality was but 1 in 19 (Price's Observations, vol. ii. p. 136); and in some of the villages in England, even at the time that Dr Price wrote, it was as low as 1 in 70 and 1 in 75.

roportion births the po- ulation.

The proportion of births to the population appears to vary in different countries and under different circumstances, from about 1 in 17 to 1 in 49. In New Spain, according to Humboldt, it was 1 in 17. In New Jersey, according to the rate of increase determined by the census taken in 1738 and seven years afterwards, the proportion of births must have been about 1 in 18. (Price, vol. ii. p. 50.) At present, as far as can be collected from scattered facts and inferences, the proportion of births in the whole of the United States is about 1 to 19. In the table for Prussia and Lithuania given by Sussmilch, it appears, that after the great plague of 1709 and 1710, and omitting the extraordinary year immediately subsequent, the proportion of births in the five years ending with 1716 was 1 in less than 17;[5] while, according to M. Muret, in the parish of Leyzin, the proportion of births was only 1 in 49 of the population.

riations the mber of bsisting rriages one an- al birth.

The number of subsisting marriages which yields one annual birth appears to vary from 12 to 4, and the two extreme cases occur in what may be called the same country, and are both noticed by M. Muret; the one in the parish of Leyzin, which presents all the symptoms of the prudential check to population in the greatest excess, and where twelve subsisting marriages yield only one annual birth; and the other in the parish of St Cergue, in the Jura, where marriage is encouraged by the habit of emigration, and four subsisting marriages are sufficient to yield one annual birth.

Different proportions of the population under 16.

The proportion of the population under 16 years of age to that above 16 seems to vary in different countries and places, and under different circumstances, from one half to one fourth. In the United States, it appears by the late census that it is one half; while in the canton of Berne it is not much more than one fourth, and in the parish of Leyzin not more than one fourth.[6]

Variations in the mortality under 15.

The mortality under the age of 15 varies in different places and circumstances, from above two thirds to one fifth. It appears from a table of Dr Price, that in Stockholm above two thirds died under 15 (vol. ii. p. 418); while, according to M. Muret, the proportion of the deaths under the age of 15 was, in the whole of the Pays de Vaud, one third, in many parishes of the Alps one fourth, and in the extraordinary parish of Leyzin only one fifth.[7]

Under these very great variations in the registers of different countries and places, and in the structure of their population, it is obvious that we might fall into the grossest possible errors, by applying the registers of one country to the population of another. Even if we could find a country which was near to a just mean between these opposite extremes, and the registers of which were kept with the greatest accuracy, we could not apply such registers to any other country with a view to any important inferences, unless we knew that the two countries nearly resembled each other, not only in one or two particulars, but in all the main points relating to the structure of their population and the character of the prevailing checks to it.

First tables of mortality formed from the registers of towns.

When attention was first directed to tables of mortality with a view to assurances on lives and survivorships, these tables were almost universally formed from the registers of towns, and of the neighbouring villages influenced by them. Buffon, calculating the probability of life from the registers of three parishes in Paris, and twelve country parishes in the neighbourhood, collected by M. Dupré de St Maur, makes it appear that half of the born died under eight years of age. The parishes in Paris seemed to be healthier than the villages in the neighbourhood, which was occasioned by the custom of sending the children from the city to be nursed in the country. Other calculations from the registers of Breslau by Dr Halley, of London by Mr Simpson, and subsequently of Northampton, Warrington, Chester, Norwich, &c. by Dr Price and other writers, all concurred to convey the impression that more than half of the born die under the age of puberty; and though Dr Price, in his two volumes of Observations on Reversionary Payments, takes frequent opportunities of dwelling upon the prodigious difference in the mortality of towns and of country situations, and produces abundance of evidence to show that, taken together, in the actual state of things, half of the born live much beyond the age of puberty; yet, among some persons who have not attended to the subject, the former impression seems still to have remained; and, what is more strange, it has been lately asserted that this must happen from the constitution and course of human nature (Godwin's Answer to Malthus); which is going very much further than to say that it happens under the poverty, distress, and unhealthy occupations which are known to affect the mortality of a considerable body of people in all the nations with which we are acquainted.

---

[1] This last number, stated by M. Muret for the parish of Leyzin, on the Alps, is so very extraordinary, that possibly it may not be correct.

The constitution and course of human nature determinable only by experience.

The constitution and course of human nature can only be determined by experience, and the analogies derived from it; and the kind of experience necessary to determine the point in question is to be obtained only by a reference to registers which inform us of the ages at which the born have died. Now, from the evidence of registers of this kind which have been carefully kept in country parishes, it appears that the age to which half of the born live is much nearer to forty than to the age of puberty. Even in Sweden, where the general mortality is unquestionably very great, owing to the poverty of the labouring classes, and the diseases brought upon them by bad and insufficient food during seasons of scarcity, the age to which half of the born live is, as before stated, above thirty-three;[1] in the whole of the Pays de Vaud it is forty-one; in many particular parishes forty-seven; in a parish in England not so healthy as many others, forty-seven; and as the expectation of life appears, by the late returns from the parish registers of Great Britain, to be as high as in Switzerland, there is little reason to doubt, from the evidence of registers, that the age to which half of the born live in this country can fall but little short of what it is in the Pays de Vaud, that is, it must be somewhere near forty. But it will hardly be contended that there is no premature mortality in Great Britain occasioned by the pressure of poverty, and the effect of large towns and unwholesome occupations. Consequently, unless we are prepared to say that agricultural employments, airy and moderately-sized towns, cleanliness, healthy occupations, and prudence, are against the constitution and course of nature, as applied to reasonable beings, we must acknowledge, that if the constitution and course of nature were carefully observed, and the admonitions which they give properly attended to, half of the born would, in healthy climates, live on an average to forty-five. Taking things, however, as they are, it is obvious that, according to the testimony of the best registers, more than half of the born might live to marry in most countries, even if the average age of marriage was so late as thirty.

Immediate causes of the increase of population.

The immediate cause of the increase of population is the excess of the births above the deaths; and the rate of increase, or the period of doubling, depends upon the proportion which the excess of the births above the deaths bears to the population.

The excess of births is occasioned by, and proportioned to, three causes: 1*st*, the prolificness of the marriages; 2*dly*, the proportion of the born which lives to marry; and, 3*dly*, the earliness of these marriages compared with the expectation of life, or the shortness of a generation by marriage and birth, compared with the passing away of a generation by death.

In order that the full power of increase should be called into action, all these circumstances must be favourable. The marriages must be prolific, owing to their being contracted early; the proportion of the born living to marry must be great, owing both to the tendency to marriage, and the great proportion of births rising to the age of puberty; and the interval between the average age of marriage and the average age of death must be considerable, owing to the great healthiness of the country, and the expectation of life being high. Probably these three causes, each operating with the greatest known force, have never yet been found combined. Even in the United States, though the two first causes operate very powerfully, the expectation of life, and consequently the distance between the age of marriage and the average age of death, is not so favourable as it might be. In general, however, the excess of births which each country can admit being very far short of the full power of increase, the causes above mentioned contribute to the required supply in very various proportions, according to the different circumstances and habits of each state.

Inferences drawn from registers.

It would be very desirable to know something of these proportions, with a view to their influence on the happiness of society. Our main sources of information on this subject are registers of births, deaths, and marriages; but in order to draw just inferences from them, we must consider well what they imply. The following observations and rules, modified from Mr Malthus's chapter on the fruitfulness of marriages, may be useful for this purpose.

Proportion of births to a marriage.

If we suppose a country where the population is stationary, where there are no emigrations, immigrations, or illegitimate children, and where the registers are accurate, then the proportion of the annual births to the annual marriages will accurately express both the number of children born to each marriage, including second and third marriages, and also the proportion of the born which lives to marry once or oftener, while the annual mortality will accurately express the expectation of life.

But if the population be either increasing or decreasing, and the births, deaths, and marriages increasing or decreasing in the same ratio, such a movement will necessarily disturb all the proportions, because the events which are contemporary in the registers are not contemporary in the order of nature.

In the first place, the births of any year cannot, in the order of nature, have come from the contemporary marriages, but must have been derived principally from the marriages of preceding years.

If we were to cut off a period of thirty years in the registers of any country some time ago, and inquire what was the number of births which had been produced by all the marriages included in the period cut off, it is evident, that with the marriages at the beginning of the period will be arranged a number of births proceeding from marriages anterior to it; and at the end a number of births produced by the marriages included in the period will be found arranged with the marriages of a succeeding period. Now, if we could subtract the former number, and add the latter, we should obtain exactly all the births produced by the marriages of the period, and thus ascertain the real prolificness of marriages. If the population had been stationary, the number of births to be added would exactly equal the number to be subtracted, and the proportion of births to marriages, as found in the registers, would exactly represent the real prolificness of marriages. But if the population be increasing, the number to be added would be greater than the number to be subtracted, and of course the proportion of births to marriages, as found in the registers, would always be too small to represent the true prolificness of marriages. A contrary effect would take place in a decreasing population. The question therefore is, what we are to add, and what to subtract, when the births and deaths are not equal.

The average proportion of births to marriages in Europe, as taken from registers, is about four to one. Let us suppose, for the sake of illustration, that each marriage yields four children, one every other year. In this case, wherever the period in the registers is begun, the marriages of the preceding eight years will only have produced half their births, and the other half will be arranged with the marriages within the period, and ought to be subtracted from them. In the same manner the marriages of the last eight years of the period will only have produced half their births, and the other half ought to be added. But half the births of any eight years may be considered as nearly equal to all the births of the succeeding three years and three quarters. In instances of the most rapid increase it will rather exceed the births of the next three years and a half, and in cases of slow increase approach towards the births of the next four years. The mean, therefore, may be taken at three years and three quarters. Consequently, if we subtract the births of the first three years and three quarters, and add the births of the three years and three quarters subsequent to the period, we shall have a number of births nearly equal to the number of births produced by all the marriages included in the period, and, of course, the prolificness of marriages. But if the population of a country be increasing regularly, and the births, deaths, and marriages continue always to bear the same proportion to each other and to the whole population, it is evident that all the births of any period will bear the same proportion to all the births of any other period of the same extent taken a certain number of years later, as the births of any single year to the births of a single year taken the same number of years later. And, consequently, to estimate the prolificness of marriages, we have only to compare the marriages of the present, or any other year, or the mean of five years, with the births of a subsequent year, or the mean of five years taken three years and three quarters later.

---

[1] We allude to the registers and tables referred to by Dr Price. Since his time the health of the country has increased, like that of most of the countries in Europe, and the proportions of both the births and deaths have decidedly diminished.

It has been supposed, in the present instance, that each marriage yields four births; but the proportion of births to marriages apparent in the registers of most of the countries of Europe is four to one, and as the population of most of the countries of Europe is known to be increasing, the prolificness of marriages must be greater than four. If, allowing for this circumstance, we take the distance of four years instead of three years and three quarters, we shall still be sure of not erring in excess. And though undoubtedly the period which we take, whatever it may be, will not answer exactly in different countries, yet its application generally will not be so incorrect as we might at first imagine, because, in countries where the marriages are more prolific, the births generally follow at shorter intervals, and where they are less prolific, at longer intervals; and, with different degrees of prolificness, the length of the period might still remain the same.

Probably, however, the period here assumed, which is the one taken by Mr Malthus, is too short. If, as he says, there is reason to think, that, in almost all registers, the omissions in the births and deaths are greater than in the marriages, there ought to be a greater number of births to each marriage, in which case it would take a longer time to have them in; and if, further, it is probable that a birth every other year is too rapid a succession for those countries where the marriages are frequently late, it may be thought that the births at the distance of five years will more nearly represent the prolificness of marriages than at the distance of four years. But this matter must be left to the judgment of the reader.

At all events, it will follow, from what has been said, that the more rapid is the increase of population, the more will the real prolificness of marriages exceed the proportion of births to marriages in the registers.

The rule which has here been laid down attempts to estimate the prolificness of marriages, taken as they occur; but this prolificness should be carefully distinguished from the prolificness of first marriages, and of married women, and still more from the natural prolificness of women in general, taken at the most favourable age. It is probable that the natural prolificness of women is nearly the same in most parts of the world; but the prolificness of marriages is liable to be affected by a variety of circumstances peculiar to each country, and particularly by the number of second, and third, and late marriages. In all countries the second and third marriages alone form a most important consideration, and materially influence the average proportions. According to Sussmilch, in all Pomerania, from 1748 to 1756 both included, the number of persons who married were 56,956, and of these 10,586 were widows and widowers.[1] According to Busching, in Prussia and Silesia, for the year 1781, out of 29,308 persons who married, 4841 were widows and widowers;[2] and, consequently, the proportion of marriages will be given fully one sixth too much. In estimating the prolificness of married women, the number of illegitimate births would tend, though in a slight degree, to counterbalance the overplus of marriages; and as it is found that the number of widowers who marry again is greater than the number of widows, the whole of the correction should not, on this account, be applied; but in estimating the proportion of the born which lives to marry, which is what we are now about to proceed to, the whole of this correction is always necessary.

Proportion of the born which lives to marry.

To find the proportion of the born which lives to marry, from registers, we must consider that the marriages of any year can never be contemporary with the births from which they have resulted, but must always be at such a distance from them as is equal to the average age of marriage.

If the population be increasing, the marriages of the present year have resulted from a smaller number of births than the births of the present year; and, of course, the marriages, compared with the contemporary births, will always be too few to represent the proportion of the born which lives to marry, and the contrary will take place if the population be decreasing; and to find this proportion, after having first made the proper correction for second and third marriages, we must compare the marriages of any year with the births of a previous year at the distance of the average age of marriage.[3]

Expectation of life.

The third principal object which it is desirable to attain, and of which some estimate may be formed from registers, is the expectation of life. It has before been stated, that, in a country where the births and deaths are equal, the rate of the annual mortality will express the expectation of life, or the average age of death. But if the population be increasing, the actual population of any one year will be greater than would belong to the contemporary deaths, supposing the births equal to the deaths, and less than would belong to the contemporary births, supposing the deaths equal to the births. Consequently, if we divide the actual population by the number of contemporary deaths in an increasing country, the result will be too high to express the average age of death belonging to any given number of births. If we divide the actual population by the number of births, the result will be too low to express this average, or, in other words, to express the expectation of life. And, in order to approximate to the true proportion, we are directed by Dr Price (vol. ii. p. 39, seventh edition), in the absence of better data, to divide the actual population by a mean between the proportions of deaths and births. Consequently, when we know the proportion of births to deaths in any country, and the proportions which they usually bear to the whole population, we may form some estimate of the expectation of life, or the average age of death.

If we attend to these observations in drawing our inferences from registers, we shall generally be able to form an approximating estimate of the prolificness of marriages, the proportion of the born living to marry, and the expectation of life, in different countries and places, and under different circumstances; or if we cannot do this satisfactorily, owing to the varying rate of increase, and the inaccuracy of the registers, we shall at least guard ourselves against drawing incorrect inferences from them in their present state, and reconcile many of the difficulties with which they appear to be accompanied.

---

[1] *Gottliche Ordnung*, vol. i. tables, p. 98.

[2] Malthus, vol. ii. p. 140.

[3] It is a shorter and more obvious process to compare the marriages at once with the births of the earlier period, than with the deaths, as Mr Malthus has done.

Prolificness of marriages in England.

Thus, to estimate the prolificness of marriages in England, the proportion of the marriages to the births, according to the parochial returns ending with 1820, was 100 to 369; adding one sixth for the omissions in the births, or on the present occasion only one seventh, in order to make full allowance for illegitimate births, the proportion of marriages to births will be as 100 to 422. These births, at the rate at which the population was increasing in England and Wales from 1810 to 1820, would, in about four years and a half, increase ·07, which, added to 4·22, makes 4·51. Consequently, the prolificness of marriages, taken as they occur, and including second and third marriages, would be 4·51. If we wish to estimate the prolificness of married women, we must subtract from the marriages those which consist of widows who have married again. According to some tables of Sussmilch, this would be little less than one sixth, according to others one eighth. If we take one seventh, and deduct it from the marriages, the proportion will be 1 to 5·26, that is, each married woman will have 5·26 births. But of these married women, some have married at above forty-five years of age, and many more above thirty-five, so that there can be little doubt that, if the births could be collected from all the marriages in which the age of the woman did not exceed thirty-five, nor the age of the man forty-five, the births would appear to be nearly six; and this number would be still further increased if the average age of marriage for males was twenty-two, and for females twenty. These conclusions are fully confirmed by some accurate observations of M. Muret. At Vevay, where the proportion of marriages to births, in the registers, was as ten to thirty-nine, he found that 375 mothers had had 2093 children born alive, by which it appears that each mother had produced 5·55 births. But these, M. Muret observes, were all mothers, which is not the case of all married women. Allowing, however, for the usual proportion of barren wives at Vevay, which was about twenty out of 478, it appears that the married women, one with another, must have had above 5·3 births. Yet this was in a town where he intimates that the inhabitants do not enter into the marriage state at the time when nature calls them, nor, when married, always have as many children as they might have. It is evident, therefore, that the proportions of marriages to births, to be found in registers, require considerable and important corrections, in order to deduce from them just estimates of the prolificness of marriages, the prolificness of married women, and the prolificness of women marrying at the most favourable age. The instance here given is sufficient to illustrate the mode in which the rule should be applied.

Proportion of the born living to marry in England.

If we wish to apply the rule for estimating the proportion of the born living to marry in England, we must first take the proportion of marriages to births in the registers. This proportion, as before stated, was, during the ten years ending with 1820, as 100 to 369; which, increased by one sixth, the supposed omissions in the registers of births will be as 100 to 430. But the marriages of the present year must have resulted, not from the births of the present year, but from the births at such an earlier period in the registers as is equal to the average age of marriage. Suppose this age to be twenty-eight, then, at the rate at which the population was increasing, the present marriages must have resulted from a number of births equal to about two thirds of the present number, so as to be to the present marriages in the proportion of 286 instead of 430 to 100. But of the 200 persons forming the 100 marriages, more than one sixth have been married before. Deducting, therefore, one sixth from the marriages, the proportion of the marriages to the births from which they have resulted will be as 100 to 343; or, out of 343 births, 200 have lived to be married once or oftener; from which it would appear, that on account of the late increase in the healthiness of the country, a greater proportion had lived to marry than when Mr Malthus last estimated it; which, together with a slight increase in the prolificness of marriages apparent in the latter registers, may account for the more rapid increase of the population from 1810 to 1820. It should be recollected, however, that as the rate of increase which prevailed from 1810 to 1820 had by no means prevailed during the whole twenty-eight years, the births, from which 200 person had lived to marry in 1820, were decidedly more than 343.

It will be observed how very important the correction for second and third marriages is. Supposing each marriage to yield four births, and the births and deaths to be equal, it might at first be thought necessary, that in order to keep up the population, half of the born should live to marry; but if, on account of the second and third marriages, we subtract one sixth from the marriages, and then compare them with the births, the proportion will be as five to twenty-four; and it will appear, that instead of one half, it will only be necessary, that out of twenty-four births, ten should live to marry. Upon the same principle, if the births were to the marriages as four to one, and exactly half of the born lived to marry, it might be supposed at first that the population would be stationary; but if we subtract one sixth from the marriages, and then compare them with the births, it will be obvious that, on the supposition of half the born living to marry, the births at the earlier period in the registers, at the distance of the age of marriage, must be to the present births as five to six, which would imply a moderate rate of increase.

To estimate the proportion of male births living to marry, we must subtract full one fifth from the marriages; and, according to this correction, if each marriage yielded four births, it would only be necessary that two male children out of five should live to marry, in order to keep up the population. It is necessary, also, in estimating the proportion of male births living to marry, to make allowance for the greater number of males born.

The foregoing illustrations and remarks show the error of supposing that a country must be in a precarious state when the proportion of births to marriages in the registers is less than four to one. If, indeed, this observation were just, the population of many countries in Europe would be in a precarious state, as in many countries the proportion is less than this. But it has been shown in what manner this proportion in the registers should be corrected, in order to make it a just representation of the prolificness of marriages; and if a large part of the born live to marry, and the age of marriage be considerably earlier than the expectation of life, such a proportion in the registers is by no means inconsistent with a rapid increase of population.

In Russia, the proportion of births to marriages is less than four to one; yet, on account of the large proportion of the born living to marry, the early age of marriage, and the high expectation of life, it is one of the countries in Europe which increases the fastest. In England, the population increases much more rapidly than in France; yet in England the proportion of births to marriages in the registers, when allowance has been made for omissions, was, from 1800 to 1810, four to one, while in France it was four and four fifths to one. (Malthus, vol. ii. p. 161. 5th edit.)

In England, indeed, for the ten years from 1810 to 1821, the proportion of births to marriages seems slightly to have exceeded the former proportion, being about 4·22 to 1; but this excess has been accompanied by such a rapidity of increase as would double the population in less than forty-six years; and comparing this rapid rate of increase with the slow increase of France, where the births were to the marriages as four and four fifths to one, and in Sweden, where these proportions were as four and one fourth to one, it follows that the two other causes of the excess of births above the deaths, besides the prolificness of marriages, must have very great power, and that the proportion of births to marriages, as found in registers, when taken alone, is a most uncertain criterion of increase.

Expectation of life in England.

To apply the rule for estimating the average age of death, or the expectation of life, in England, we must first ascertain from the registers the proportions which the births and deaths bear to the whole population. The annual average of the births for the ten years from 1810 to 1821 was 325,506, of the deaths 200,999. Adding one sixth to the births, and one twelfth to the deaths, for the omission in the registers, the births will be 379,757, and the deaths 217,749. The population of England and Wales, according to the census taken in 1810, was 10,502,500, in 1821, 12,218,500,[1] the mean of which is 11,360,500. The average births and deaths, compared with the mean population, give $\frac{1}{29\cdot9}$ as the proportion of the births, and $\frac{1}{52\cdot17}$ as the proportion of the deaths; and, according to Dr Price, the mean between them, which in this case is forty-one, will give the expectation of life. This rule, however, is only a rough approximation, and, in the few cases where sufficient data have been obtained in progressive countries for calculating the expectation of life more accurately, it has turned out to be much nearer to the annual mortality than to the mean here referred to; while, according to the more correct estimates before adverted to, the annual mortality might, with the same expectation of life, be in different countries 1 in 39·38, 1 in 41·97, or 1 in 41·09, according as the population was stationary, or progressive at various rates.

This appears in the table which Dr Price himself calculated for Sweden (vol. ii. p. 410, 7th edit.), founded on data which he considered as quite satisfactory. It also appears in the table for Sweden and Finland, subsequently calculated by Mr Milne from similar data, in his Treatise on Annuities and Assurances, vol. ii. p. 569; and, further, in a table for Sweden and Finland, published in this work, under the head Mortality. We have also seen a calculation by Mr Milne, by which it appears that the difference between the annual mortality and the expectation of life goes on increasing with the rate of the increase of the population to a certain point, but afterwards, owing to the increasing proportion of young children included in the population, diminishes; and is less when the population doubles in twenty-five years, than when it doubles in fifty years. Thus, on the three different suppositions of a stationary population, a population doubling in fifty years, and a population doubling in twenty-five years (all subjected to the same law of mortality as that which prevailed in Sweden and Finland during the five years ended with 1805), in the first case, both the expectation of life and the annual mortality would be 39·388, and, of course, the expectation of life would be the same in all the cases; but in the second case, the annual mortality would be 1 in 41·971; and, in the third, 1 in 41·096. It would be difficult, however, or at least premature, without further data, to lay down a general rule, with a view to determine correctly the expectation of life at birth, in countries progressive at various rates. But, from what has been stated, it may safely be concluded, that the expectation of life lies very much nearer the annual mortality, particularly in cases of very rapid increase, than to the mean proposed by Dr Price; and that both the expectation of life, and the age to which half of the born live, are, in most countries, and especially in England, at the present time, considerably higher than they have generally been estimated.

It may be remarked here, in reference to England during the ten years from 1810 to 1821, that the omissions assumed in the births and deaths do not give such proportions as to make the increase of population, from the excess of births above the deaths, answer to the increase determined by the two censuses; an agreement which must necessarily take place if both the enumerations and the registers are accurate, and no external causes disturb the result. An addition of one sixth to the births, and one twelfth to the deaths, seemed to answer correctly for the interval from 1800 to 1810; but to produce the same coincidence under the more rapid increase of the subsequent ten years, either a greater allowance must be made for omissions in the births, or a less allowance for the omissions in the deaths. If we add one fifth instead of one sixth to the births, retaining one twelfth for the deaths, the excess of births above deaths in the ten years will be 1,728,587, the excess according to the censuses being 1,716,000; if we add only one thirtieth to the deaths, retaining one sixth for the births, the excess will be 1,720,502, within 4502 of the excess, as shown by the censuses; whereas, under the actual allowances which have been made for omissions, the excess will be only 1,620,800, leaving a difference of 95,200, and on the wrong side. On account of the almost incredible healthiness, considering our great towns and manufactories, which would be implied by supposing the deaths to be only deficient one thirtieth, an increased omission in the births might be thought more probable; but it is believed, that since 1812 the omissions in the births have been diminished rather than increased; and under this uncertainty it has been thought better to leave the question as it stands at present, rather than attempt to determine it on insufficient data. It should always be remembered, however, that if the increase of population by the enumerations is different from the increase of population by the registers, one or the other must be incorrect.

Expectation of life at birth, and annual mortality, not the same when the population is progressive.

On the supposition that the omissions in the deaths were only one thirtieth, the average mortality, compared with the average population, would be 1 in 54·7; and the proportion of births, with the addition of one sixth, being, as before stated, 1 in 29·9, the expectation of life, according to Dr Price's rule, would be 42·3. On the other supposition, of an omission of one fifth of the births and one twelfth of the deaths, the births would be 1 in 29, and the deaths 1 in 52·17, and the expectation of life would be 40·58.

It appears, then, that when the population of a country is progressive, it would be erroneous to estimate its healthiness by the proportion which the annual mortality bears to the whole population. Healthiness must be measured by the expectation of life; and if, with the same expectation of life, the annual mortality is affected by the rate of increase, it is obvious that the healthiness of different countries may be different, with the same rate of annual mortality.

Mortuary registers fallacious.

But whilst it is evidently necessary that we should be cautious in inferring that a country is healthy just in proportion to the smallness of its annual mortality, we should be still more cautious in inferring that it is unhealthy at all the ages under puberty, on account of the number which appear to die in mortuary registers under that age. Here, as in the preceding case, but in a much greater degree, the excess of the births above the deaths has a powerful effect, but exactly in the opposite direction. When we compare the annual mortality of an increasing country with its actual population, we compare with it a number of deaths which may be said, properly speaking, to belong to an earlier and smaller number of births, and must necessarily represent the country as more healthy than it really is. On the other hand, when, in a mortuary register, we compare the deaths under puberty with those above, if the population be increasing, we evidently compare the deaths belonging to a much greater number of births than those which have furnished the deaths above the age of puberty; and, consequently, these proportions must represent the country as much less healthy than it really is.[1] According to the mortuary registers of Sweden for twenty-one years from 1755 to 1776, more than half of the deaths were under fifteen, but it was by no means true that half of the born died under fifteen.[2] In the tables of mortality for Sweden during the same period, constructed by Dr Price, it appears that half of the born lived to above thirty-three years.[3]

---

[1] Preliminary Observations to Population Abstracts, p. 32.

In the same manner, in drawing inferences from an abstract of the mortuary registers of the principal cities in America, Baltimore, Boston, New York, and Philadelphia, given by Dr Seybert,[4] we must take care not to conclude that the proportions of the deaths which take place under twenty years of age represent the proportions of any given number of births in these cities which die under twenty. As, on account of the excess of the births above the deaths, all the early ages of the population are more numerous in proportion than the other, there will necessarily be a greater proportion of the deaths at these ages than would naturally belong to a given number of births, if each infant born were traced to the age of its death.

In the present case, the abstract is only for a year, and no safe conclusions therefore can be drawn from it; but, so far as it goes, as even, notwithstanding the increase of population, these mortuary registers show that considerably less than half of the deaths take place under twenty (on an average only about 45½ per cent.), it would appear, that in the early ages of life, even the towns of America are more healthy than the whole of Sweden from 1755 to 1776. It should, however, be considered, that though the towns in America may be increasing fast by procreation, they are increasing still faster by the influx of inhabitants from the country; and as these inhabitants generally come to the towns after the age of sixteen, this accession diminishes the proportion of persons in the earlier ages of life so much, that there is probably a larger proportion of mortality at these ages in the country than in the towns.

Criterion of the prevalence of prudential restraint.

One of the most interesting and useful points of view in which registers can be considered, is in the proofs which they afford of the varying prevalence of the prudential check to marriage and population in different countries and places. It has been not an uncommon opinion, and has even been strongly expressed of late years, although the subject has been much better understood than formerly, that the labouring classes of people, under the circumstances in which they are placed, cannot reasonably be expected to attend to prudential considerations in entering upon the marriage state. But that this opinion does them great injustice, is not only obvious to common observation, by which we can scarcely fail to see that numbers delay marriage beyond the period when the passions most strongly prompt to it, but is proved by the registers of different countries, which clearly show, either that a considerable number of persons of a marriageable age never marry, or that they marry comparatively late, and that their marriages are consequently less prolific than if they had married earlier. As the prudential restraint on marriage may show itself in either of these ways, it may prevail nearly in the same degree with a different proportion of the whole population. But on the supposition of the same natural prolificness in the women of most countries, the smallness of the proportion of births will generally indicate, with tolerable correctness, the degree in which the prudential check to population prevails, whether arising principally from late, and consequently unprolific marriages, or from a large proportion of the population dying unmarried.

Referring, then, to the different proportions of births in different countries as the best criterion of the different degrees in which the prudential restraint on marriage operates, it will be recollected that these proportions vary from about one in thirty-six to about one in nineteen or even seventeen, in different countries, and in a much greater degree in different parishes or districts.

A particular parish in the Alps has already been mentioned, where the births were only a forty-ninth part of the population; and it appears by the late returns of the parish registers of England and Wales, that the births in the county of Monmouth are only one in forty-seven, and in Brecon one in fifty-three;[5] which, after making ample allowance for omissions, would show the prevalence of the prudential restraint on marriage in a high degree.

Effect of the absence of prudential restraint.

If in any country all were to marry at twenty or twenty-one, the proportion of the births would probably be more than one in nineteen; and this result would be still more certain if the resources of the country could not support an accelerated rate of increase, than if the means of subsistence were in the greatest abundance, and the demand for labour as effectual as it has ever been in the United States. Of the latter supposition, taking the births at one nineteenth, and the expectation of life the same as it is in England, the effect would be to occasion a most rapid increase of population; and the period of doubling, instead of being about forty-six or forty-eight years, would be less than in America. On the other hand, if the resources of the country could not support a more rapid increase than that which has taken place in England and Wales during the ten years previous to the census of 1821, the effect would be a great diminution in the expectation of life. If the births were one in nineteen instead of one in nearly thirty, the same rate of increase would take place as at present if the annual mortality were increased to about one in twenty-six and a half; and in that case the expectation of life would be reduced in the proportion of from forty-one, or, as is more probable, from above forty-five, to less than twenty-six.[6] This is the kind of effect which must inevitably follow the absence of the prudential check to marriage and population; and it cannot be doubted, that a considerable part of the premature mortality which is found to take place in all parts of the world is occasioned by it. The laws of nature, in application to man as a reasonable being, show no tendency to destroy half of the human race under the age of puberty. This is only done in very particular situations, or when the constant admonitions which these laws give to mankind are obstinately neglected.

---

[1] In the first case, the effect is, in a considerable degree, counteracted by the large proportion of children under four years old, which a rapid increase occasions. In the second case, the effect has no such drawback.

[2] Price's Observations, vol. ii. p. 405, 7th edit.

[3] *Ibid.* table xlv. vol. ii. p. 413.

[4] Statistical Annals, p. 48.

[5] Preliminary Observations, p. 27.

[6] If, as it has appeared, the expectation of life, though by no means the same, does not differ very much from the annual mortality, and the annual mortality in this country during the ten years from 1810 to 1820, after every abatement, appears to be not more than one in fifty-one, the expectation of life cannot be less than forty-five, and is probably greater.

Objection to the principle of population arising from the mortality it must occasion.

It has been said that a tendency in mankind to increase at such a rate as would double the population in twenty-five years, and, if it had full scope, would fill the habitable globe with people in a comparatively short period, cannot be the law of nature, as the very different rate of increase which is actually found to take place must imply such an excessive degree of mortality and destruction of life as to be quite irreconcileable with actual facts and appearances. But the peculiar advantage of a law of increase in a geometrical progression is, that though its power be absolutely immense if it be left unchecked, yet, when this becomes impossible, it may be restrained by a comparatively moderate force. It can never of course happen that any considerable part of that prodigious increase which might be produced by an uninterrupted geometrical progression, should exist, and then be destroyed. The laws of nature, which make food necessary to the life of man, as well as of plants and animals, prevent the continued existence of an excess which cannot be supported, and thus either discourage the production of such an excess, or destroy it in the bud, in such a way as to make it scarcely perceptible to a careless observer. It has been seen, that in some countries of Europe where the actual progress of the population is slower than in many others, as in Switzerland and Norway, for instance, the mortality is considerably less. Here, then, the necessity of a greater check to the natural progress of population produces no increase of mortality. And it appears farther, that even the degree of mortality which in each year would be sufficient to destroy that excess of births which would naturally be produced if all married young, and all could be supported, might take place, and often does take place in particular situations, and yet is very little noticed. About the middle of last century, the mortality in Stockholm and London was about one in nineteen and one in twenty. This is a degree of mortality which would probably keep the births on a level with the deaths, even though all married at twenty. And yet numbers resorted both to Stockholm and London from choice, the greater part probably not aware that, by so doing, they would shorten their own lives and those of their children; and the rest thinking that the difference was not worth attending to, or was at least balanced by the advantages of society and employment which the town presented. There is nothing, therefore, in the actual state of the mortality observed to take place in different countries and situations, which, in the slightest degree, contradicts the supposition of a natural tendency to increase quite as great as that which has been stated.

Objection that mere tendencies are not to be considered.

It has been further remarked, that as, in point of fact, it very rarely happens that mankind continue to increase in a geometrical progression of any kind, and only in a single instance in such a one as to double the population in twenty-five years, it is useless and absurd to lay any stress upon tendencies which never for any length of time together produce their natural effects. But it might really as well be said, that we are not to estimate the natural rate of increase in wheat or sheep, as it is quite certain that their natural tendency to increase has never practically continued to develope itself for so long a time together as that of mankind. Both as a physical and even economical question, it is curious and desirable to know the natural law of increase which prevails among the most important plants and animals. In the same view, it must be still more interesting to know the natural law of increase with respect to man. It may be said, indeed, with truth, that the actual appearances all around us,—the varying rate of increase in different countries, its very slow progress or stationary state in some, and its very rapid progress in others,—must be a mass of anomalies, and quite contrary to the analogies of all the rest of animated nature; if the natural tendency of mankind to increase be not at the least as great as that which is developed under the most favourable circumstances, while in all others it is kept down by the varying difficulties which the state of the soil and other obstacles oppose to it. But the question, as it applies to man, assumes at once a tenfold importance, in reference to the moral and political effects which must result from those checks to increase, the existence and operation of which, in some form or other, no human exertions can by possibility prevent. A field is here opened for the most interesting inquiries which can engage the friends of human happiness.

But, as a preliminary to these inquiries, it is obvious that we must know the degree of force to be overcome, and the varying character of the checks which, in the different countries of the world, are practically found to overcome it; and, for this purpose, the first step must be an endeavour to ascertain the natural law of population, or the rate at which mankind would increase under the fewest known obstacles. Nor can this tendency to increase ever safely be lost sight of in the subsequent inquiries, which have for their object the improvement of the moral condition of man in society.

Right of the poor to full support considered.

The existence of a tendency in mankind to increase, if unchecked, beyond the possibility of an adequate supply of food in a limited territory, must at once determine the question as to the natural right of the poor to full support in a state of society where the law of property is recognised. The question, therefore, resolves itself chiefly into a question relating to the necessity of those laws which establish and protect private property. It has been usual to consider the right of the strongest as the law of nature among mankind as well as among brutes; yet, in so doing, we at once give up the peculiar and distinctive superiority of man as a reasonable being, and class him with the beasts of the field. In the same language, it may be said that the cultivation of the earth is not natural to man. It certainly is not to man, considered merely as an animal without reason. But to a reasonable being, able to look forward to consequences, the laws of nature dictate the cultivation of the earth, both as the means of affording better support to the individual, and of increasing the supplies required for increasing numbers; the dictates of those laws of nature being thus evidently calculated to promote the general good, and increase the mass of human happiness. It is precisely in the same way, and in order to attain the same object, that the laws of nature dictate to man the establishment of property and the absolute necessity of some power in the society capable of protecting it. So strongly have the laws of nature spoken this language to mankind, and so fully has the force of it been felt, that nothing seems to be thought so absolutely intolerable to reasonable beings as the prevalence in the same society of the right of the strongest; and the history of all ages shows, that if men see no other way of putting an end to it, than by establishing arbitrary power in an individual, there is scarcely any degree of tyranny, oppression, and cruelty, which they will not submit to from some single person and his satellites, rather than be at the mercy of the first stronger man who may wish to possess himself of the fruit of their labour. The consequence of this universal and deeply-seated feeling, inevitably produced by the laws of nature, as applied to reasonable beings, is, that the almost certain consequence of anarchy is despotism.

Allowing, then, distinctly, that the right of property is the creature of positive law, yet this law is so early and so imperiously forced on the attention of mankind, that if it cannot be called a natural law, it must be considered as the most natural as well as the most necessary of all positive laws; and the foundation of this pre-eminence is its obvious tendency to promote the general good, and the obvious tendency of the absence of it to degrade mankind to the rank of brutes.

As property is the result of positive law, and the ground on which the law which establishes it rests is the promotion of the public good and the increase of human happiness, it follows, that it may be modified by the same authority by which it was enacted, with a view to the more complete attainment of the objects which it has in view. It may be said, indeed, that every tax for the use of the government, and every country or parish rate, is a modification of this kind. But there is no modification of the law of property having still for its object the increase of human happiness, which must not be defeated by the concession of a right of full support to all that might be born. It may be safely said, therefore, that the concession of such a right, and a right of property, are absolutely incompatible, and cannot exist together.

To what extent assistance may be given even by law to the poorer classes of society when in distress, without defeating the great object of the law of property, is essentially a different question. It depends mainly upon the feelings and habits of the labouring classes of society, and can only be determined by experience. If it be generally considered as so discreditable to receive parochial relief, that great exertions are made to avoid it, and few or none marry with a certain prospect of being obliged to have recourse to it, there is no doubt that those who were really in distress might be adequately assisted, with little danger of a constantly increasing proportion of paupers; and in that case a great good would be attained, without any proportionate evil to counterbalance it. But if, from the numbers of the dependent poor, the discredit of receiving relief is so diminished as to be practically disregarded, so that many marry with the almost certain prospect of becoming paupers, and the proportion of their numbers to the whole population is in consequence continually increasing, it is certain that the partial good attained must be much more than counterbalanced by the general deterioration in the condition of the great mass of the society, and the prospect of its daily growing worse; so that, though, from the inadequate relief which is in many cases granted, the manner in which it is conceded, and other counteracting causes, the operation of poor-laws such as they exist in England might be very different from the effects of a full concession of the right, and a complete fulfilment of the duties resulting from it, yet such a state of things ought to give the most serious alarm to every friend to the happiness of society, and every effort consistent with justice and humanity ought to be made to remedy it. But whatever steps may be taken on this subject, it will be allowed, that with any prospect of legislating for the poor with success, it is necessary to be fully aware of the natural tendency of the labouring classes of society to increase beyond the demand for their labour, or the means of their adequate support, and of the effect of this tendency to throw the greatest difficulties in the way of permanently improving their condition.

It would lead far beyond the limits which must be prescribed to this article, to notice all the various objections which have been made by different writers to the principles which have been here explained. Those which contain in them the slightest degree of plausibility have been answered by Mr Malthus in various parts of the late editions of his work, and particularly in the appendix to the fifth edition, to which we refer the reader. We will only, therefore, further notice the objection which has been made by some persons on religious grounds; for, as it is certainly of great importance that the answer which has been given to it should be kept in mind, we cannot refuse a place to a condensed statement of it at the end of this article.

Religious objection considered

It has been thought that a tendency in mankind to increase beyond the greatest possible increase of food which could be produced in a limited space, impeaches the goodness of the Deity, and is inconsistent with the letter and spirit of the Scriptures. If this objection were well founded, it would certainly be the most serious one which has been brought forward; but the answer to it appears to be quite satisfactory, and it may be compressed into a very small compass.

First, It appears that the evils arising from the principle of population are exactly of the same kind as the evils arising from the excessive or irregular gratification of the human passions in general, and may equally be avoided by moral restraint. Consequently, there can be no more reason to conclude, from the existence of these evils, that the principle of increase is too strong, than to conclude, from the existence of the vices arising from the human passions, that these passions are all too strong, and require diminution or extinction, instead of regulation and direction.

Secondly, It is almost universally acknowledged, that both the letter and spirit of revelation represent this world as a state of moral discipline and probation. But a state of moral discipline and probation cannot be a state of unmixed happiness, as it necessarily implies difficulties to be overcome, and temptations to be resisted. Now, in the whole range of the laws of nature, not one can be pointed out which so especially accords with this scriptural view of the state of man on earth; as it gives rise to a greater variety of situations and exertions than any other, and marks, in a more general and stronger manner, and nationally as well as individually, the different effects of virtue and vice, of the proper government of the passions, and the culpable indulgence of them. It follows, then, that the principle of population, instead of being inconsistent with Revelation, must be considered as affording strong additional proofs of its truth.

Lastly, It will be acknowledged, that in a state of probation, those laws seem best to accord with the views of a benevolent Creator, which, while they furnish the difficulties and temptations which form the essence of such a state, are of such a nature as to reward those who overcome them with happiness in this life as well as in the next. But the law of population answers particularly to this description. Each individual has the power of avoiding the evil consequences to himself and society resulting from it, by the practice of a virtue dictated to him by the light of nature, and sanctioned by revealed religion. And as there can be no question that this virtue tends greatly to improve the condition and increase the comforts both of the individuals who practise it, and through them of the whole society, the ways of God to man with regard to this great law are completely vindicated.

Subjoined are two tables, which may assist the reader in calculating the rate of increase in different countries, under different circumstances, and from different data. The first is the table calculated by Euler, and printed in Mr Malthus's work, at the end of his chapter on the Fruitfulness of Marriage; and the second has been calculated by Mr Bridge of Cambridge, well known as an able mathematician, and most useful elementary writer.

The first is to be used when it is wished to estimate the rate of increase by the proportions of the births to the deaths, and of these to the whole population. The yearly increase of people, independently of immigration, is the yearly excess of the births above the deaths; and the yearly rate of increase is measured by the proportion which this excess bears to the whole population. The fraction expressing the deaths must therefore be subtracted from the fraction expressing the births, and the remainder will be the fraction expressing the yearly rate of increase; opposite to which will be found the number of years in which the population will double itself, supposing the yearly rate of increase to continue the same for a sufficient length of time.

The second table is to be used when it is wished to know the period of doubling, resulting from a given per centage increase in ten years, determined by enumeration. An estimate of population from births and deaths is always liable to much uncertainty, on account of the varying proportions which they bear to the population. The only remedy for this uncertainty is a census; and as the useful custom of taking a census of the population every ten years has latterly prevailed in some countries, the second table is constructed to show the period of doubling, or general rate of increase, which results from any given per centage increase in ten years. The first column represents the per centage increase in ten years determined by two enumerations; and the second column the number of years in which the population will double itself, supposing it to proceed at the same rate.

(T. R. M.)

PORAMUSHIR, an island in the Pacific, belonging to Russia, the largest of the Kurile group, extending from N.E. to S.W., 35 miles S. of Cape Lopatka in Kamtschatka. It is about 60 miles in length, by 20 in breadth; and the surface is for the most part hilly and bare. Bears, foxes, otters, and wolves are found on it; and seals and fish are got in the surrounding seas. The inhabitants, who do not exceed 400 in number, derive their subsistence from these animals; and the skins of the fox, otter, and wolf are exported from the island.

PORCELAIN. See POTTERY.

PORCH, in Greek στοά, a public portico in Athens, adorned with the pictures of Polygnotus and other eminent painters. It was in this portico that Zeno the philosopher taught; and hence his followers were called Stoics.

PORCUNA, a town of Spain, Andalucia, in the province of Jaen, and 21 miles W.N.W. of the town of that name. It has clean, well-paved streets, and several squares, one of which contains the parish church and the public granary. There are also a town-hall, hospital, several schools, prisons, &c. Woollen cloth, serge, and soap are manufactured here. Pop. 5272.

PORDENONE, or PORTENAU, a town of Austrian Italy, in the government of Venice, stands on the Noncello, 40 miles N.N.E. of Venice. It is well built, and surrounded with an old wall; and it contains several churches, a convent, hospital, workhouse, and theatre. Manufactures, especially that of paper, are actively carried on here; and there is some trade in corn and wine. As early as the twelfth century, Pordenone belonged to Austria, but afterwards passed, with the rest of the province of Friuli, under the dominion of Venice. Pop. 6300.

PORDENONE, the surname which *Giovanni Antonio Licinio Regillo*, an able Italian painter, received from his birth-place, Pordenone, a small town in Friuli. He was born in 1483, and acquired a knowledge of art by studying the works of Pellegrino and Giorgione. In spite, however, of this inadequate training, a strong and vigorous intellect soon made him a bold and effective artist. He adorned many villas and castles in his native district, designing with an active and ingenious fancy, and executing with a skilful and rapid hand. He painted many altar-pieces at Udine, Piacenza, and other cities, cleverly resolving all the difficulties of his art, and employing the most novel foreshortening, the most laboured perspective, and a power of relief which made his pictures appear as if actually starting from the canvass. There was no artistic feat indeed, which could daunt his towering ambition. Happening to take up his abode in Venice, he was smitten with a desire to rival the great Titian. This desire in course of time became inflamed into a mania, and actuated his entire conduct. He toiled night and day at his easel. He tried every conciliating art to secure the suffrages of the great and the influential. He placed his works on every possible occasion in juxtaposition to those of his rival. He even carried about weapons, in order that he might be ready, if every other method should fail, to decide the contest by physical force. Nor were these aspirations of Pordenone altogether without success. Some people really placed him above Titian; Charles V. presented him with the title of cavalier; and Duke Ercole invited him to the court of Ferrara. Other honours were in store for him, when he was suddenly cut off in 1539, not without suspicion of having been poisoned. The best known paintings of Pordenone are the pictures of "St Christopher," in one of the churches of his native town; "The Marriage of St Catherine," in the church of Santa Maria della Campagna at Piacenza; and the picture of "San Lorenzo Giustiniani," in the church of Santa Maria dell' Orto at Venice.

PORISM, in *Geometry*, is a name given by the ancient geometers to two classes of mathematical propositions. Euclid applies this name to propositions which are involved in others which he is professedly investigating, and which, although they do not form his principal object, are obtained along with it, as is expressed by their name, *porismata*, or acquisitions. Such propositions are now called *corollaries*. But he gives the same name, by way of eminence, to a particular class of propositions which he collected in the course of his researches, and selected from amongst many others, on account of their great subserviency to the business of geometrical investigation in general. These propositions were so named by him, either from the way in which he discovered them, that is to say, whilst he was investigating something else, so that they might be considered as *gains* or *acquisitions*, or from their utility as steps in the investigation. In this sense they are *porismata;* for πορίζω (from which, according to Proclus, the term is derived) signifies both to investigate and to acquire by investigation. These propositions formed a collection in three books, which was familiarly known to the ancient geometers by the name of Euclid's *porisms;* and Pappus of Alexandria says that it was a most ingenious collection of many things conducive to the analysis or solution of the most difficult problems, and which afforded great delight to those who were able to understand and investigate them.

Unfortunately for mathematical science, this valuable collection is now lost, and it still remains a doubtful question in what manner the ancients conducted their researches upon this curious subject. We have, however, reason to believe that their method was both comprehensive and excellent; for their analysis led them to many profound discoveries, and was restricted by the severest logic. The only account we have of this class of geometrical propositions is in a fragment of Pappus, in which he attempts a general description of them, as a set of mathematical propositions distinguishable in kind from all others; but of this description nothing remains, except a criticism on a definition of the term given by some geometers, namely, "A porism is that which is deficient in hypothesis from a local theorem," and which he finds fault with, as defining the porisms only by an accidental circumstance. Pappus also gives an account of Euclid's porisms; but the enunciations are so extremely defective, at the same time that they refer to a figure now lost, that Dr Halley confesses the fragment in question to be beyond his comprehension.

The high encomiums pronounced by Pappus on these propositions have excited the curiosity of the greatest geometers of modern times, who have attempted to discover their nature and the manner of investigating them. Fermat gave a few propositions, which have been published in his *Opera* (Tolosæ, 1679), and Bullialdus, in a tract entitled *Exercitationes Geometricæ Tres* (Paris, 1657), attempted the same thing, but with less success. Albert Girard, at a still earlier period, announced that he had restored the whole of the three books of Euclid, but it does not appear that this part of his works was ever published.[1]

At length Dr Simson, professor of mathematics in the university of Glasgow, was so fortunate as to succeed in restoring the porisms of Euclid. In the preface to his treatise *De Porismatibus*, he gives the following account of his progress and of the obstacles he encountered: "Postquam vero apud Pappum legeram Porismata Euclidis Collectionem fuisse artificiosissimam multarum rerum, quæ spectant ad analysin difficiliorum et generalium problematum, magno desiderio tenebar, aliquid de iis cognoscendi; quare sæpius et multis variisque viis tum Pappi propositionem generalem, mancam et imperfectum, tum primum lib. 1. Porisma, quod, ut dictum fuit, solum ex omnibus in tribus libris integrum adhuc manet, intelligere et restituere conabar; frustra tamen, nihil enim proficiebam. Cumque cogitationes de hac re multum mihi temporis consumpserint, atque tandem molestæ admodum evaserint, firmiter animum induxi haec nunquam in posterum investigare; præsertim cum optimus Geometra Halleius spem omnem de iis intelligendis abjecisset. Unde quoties menti occurrebant, toties eas arcebam. Postea tamen accidit ut improvidum et propositi immemorem invaserint, meque detinuerint donec tandem lux quædam effulserit quae spem mihi faciebat inveniendi saltem Pappi propositionem generalem, quam quidem multa investigatione tandem restitui."

---

[1] In his *Trigonometry*, published at the Hague in 1629, after enumerating the forms of certain rectilinear figures, Girard adds, "Le tout, quand il n'y a que deux lignes qui passant par un point, comme jadis estoyent les Porismes d'Euclid, qui sont perdus, lesquelles J'espère de mettre bientot en lumière, les ayant restituez, il y a quelques années en ça." A similar announcement is also made by him in his edition of the works of Stevinus (Lugdum. Batav. 1634, p. 459). Having mentioned that Euclid rarely employs a compound ratio, he adds, "Mais il est à estimer qu'il en a plus escrit en ses trois livres de Porismes qui sont perdus, lesquelles, Dieu aidant, J'espère de mettre en lumière, les ayant inventez de nouveau." (See the Preface to Simson's *Tractatus de Porismatibus*, in his *Opera Reliqua.*)

Dr. Simson's *Restoration* has every appearance of being just. All the lemmas which Pappus has given for the better understanding of Euclid's propositions are equally applicable to those of Dr. Simson, which are found to differ from local theorems precisely as Pappus affirms those of Euclid to have done. They require a particular mode of analysis, and are of immense service in geometrical investigation.

Whilst Dr. Simson was employed in this inquiry, he carried on a correspondence upon the subject with the late Dr. Matthew Stewart, Professor of Mathematics in the University of Edinburgh; who, besides entering into Dr. Simson's views, and communicating to him many curious porisms, pursued the same subject in a new and very different direction. He published the result of his inquiries in 1746, under the title of *General Theorems*, not wishing to give them any other name, lest he might appear to anticipate the labours of his friend and former preceptor. The greater part of the propositions contained in that work are porisms, but without demonstration; and those who wish to investigate one of the most curious subjects in geometry, will there find abundance of materials, and an ample field for discussion.

Dr. Simson defines a porism to be "a proposition, in which it is proposed to demonstrate, that one or more things are given, between which, and every one of innumerable other things not given, but assumed according to a given law, a certain relation, described in the proposition, is to be shewn to take place."

This definition is somewhat obscure, but will be plainer if expressed thus: "A porism is a proposition affirming the possibility of finding such conditions as will render a certain problem indeterminate, or capable of innumerable solutions." This definition agrees with Pappus's idea of these propositions, as far at least as they can be understood from the fragment already mentioned; for the propositions here defined, like those which he describes, are, strictly speaking, neither theorems nor problems, but of an intermediate nature between both. They neither simply enunciate a truth to be demonstrated, nor propose a question to be resolved, but are affirmations of a truth in which the determination of an unknown quantity is involved. In as far, therefore, as they assert that a certain problem may become indeterminate, they are of the nature of theorems; and, in as far as they seek to discover the condition by which that is brought about, they are of the nature of problems.

In order to give our readers a clear idea of the subject of porisms, we shall consider them in the way in which it is probable they occurred to the ancient geometers in the course of their researches. This will at the same time shew the nature of the analysis peculiar to them, and their great use in the solution of problems.

It appears to be certain, that it has been the solution of problems which, in all states of the mathematical sciences, has led to the discovery of geometrical truths. The first mathematical inquiries, in particular, must have occurred in the form of questions, where something was given, and something required to be done; and by the reasoning necessary to answer these questions, or to discover the relation between the things given and those to be found, many truths were suggested, which came afterwards to be the subject of separate demonstrations. The number of these was the greater, because the ancient geometers always undertook the solution of problems, with a scrupulous and minute attention, insomuch that they would scarcely suffer any of the collateral truths to escape their observation.

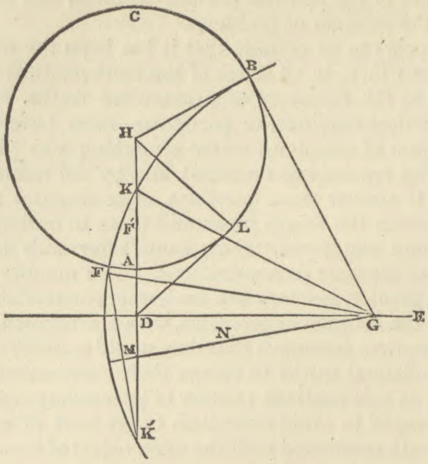
Now, as this cautious manner of proceeding was not better calculated to avoid error than to lay hold of every collateral truth connected with the main object of inquiry, these geometers soon perceived, that there were many problems which in certain cases would admit of no solution whatever, in consequence of a particular relation existing amongst the quantities which were given. Such problems were said to become impossible; and it was soon perceived, that this always happened when one of the conditions of the problem was inconsistent with the rest. Thus, when it was required to divide a line, so that the rectangle contained by its segments might be equal to a given space, it was found that this was possible only when the given space was less than the square of half the line; for when it was otherwise, the two conditions defining, the one the magnitude of the line, and the other the rectangle of its segments, were inconsistent with each other. Such cases would occur in the solution of the most simple problems; but if they were more complicated, it must have been remarked, that the constructions would sometimes fail, for a reason directly contrary to that just now assigned. Cases would occur, where the lines, which by their intersection were to determine the thing sought, instead of intersecting each other as they did commonly, or of not meeting at all, as in the above mentioned case of impossibility, would coincide with one another entirely, and of course leave the problem unresolved. It would appear to geometers upon a little reflection, that since, in the case of determinate problems, the thing required was determined by the intersection of the two lines already mentioned, that is, by the points common to both; so in the case of their coincidence, as all their parts were in common, every one of these points must give a solution, or, in other words, the solutions must be indefinite in number.

Upon inquiry, it would be found that this proceeded from some condition of the problem having been involved in another, so that, in fact, the two formed but one, and thus there was not a sufficient number of independent conditions to limit the problem to a single or to any determinate number of solutions. It would soon be perceived, that these cases formed very curious propositions of an intermediate nature between problems and theorems; and that they admitted of being enunciated in a manner peculiarly elegant and concise. It was to such propositions that the ancients gave the name of *porisms*.

This deduction requires to be illustrated by an example. Suppose, therefore, that it were required to resolve the following problem. A circle ABC, (fig. 1), a straight line DE, and a point F, being given in position, to find a point G in the straight line DE such, that GF, the line drawn from it to the given point, shall be equal to GB, the line drawn from it touching the given circle.

Suppose G to be found, and GB to be drawn touching the given circle ABC in B, let H be its centre, join HB, and let HD be perpendicular to DE. From D draw DL,

Fig. 1



touching the circle ABC in L, and join HL; also from the centre G, with the distance GB or GF, describe the circle BKF, meeting HD in the points K and K'. It is evident that HD and DL are given in position and magnitude: also because GB touches the circle ABC, HBG is a right angle; and since G is the centre of the circle BKF, HB touches that circle, and consequently HB^2 or $HL^2 = KH \times HK'$; but because KK' is bisected in D, $KH \times HK' + DK^2 = DH^2$, therefore $HL^2 + DK^2 = DH^2$. But $HL^2 + LD^2 = DH^2$, therefore $DK^2 = DL^2$ and $DK = DL$. But DL is given in magnitude, and consequently K is a given point. For the same reason K' is a given point, therefore the point F being given in position, the circle KFK' is given in position. The point G, which is its centre, is therefore given in position, which was to be found. Hence this construction:

Having drawn HD perpendicular to DE, and DL touching the circle ABC, make DK and DK' each equal to DL, and find G the centre of the circle described through the points K'FK; that is, let FK' be joined and bisected at right angles by MN, which meets DE in G, G will be the point required; or it will be such a point, that if GB be drawn touching the circle ABC, and GF to the given point, GB is equal to GF.

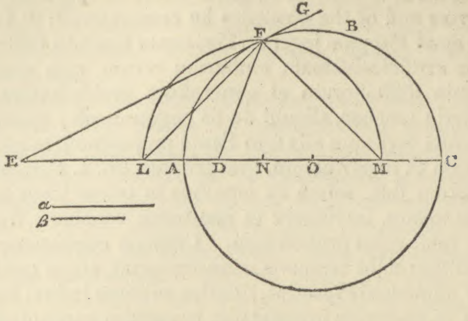
The synthetical demonstration is easily derived from the preceding analysis; but it must be remarked, that in some cases this construction fails. For, first, if F fall anywhere in DH, as at F', the line MN becomes parallel to DE, and the point G is nowhere to be found; or, in other words, it is at an infinite distance from D. This is true in general; but if the given point F coincide with K, then MN evidently coincides with DE; so that, agreeable to a remark already made, every point of the line DE may be taken for G, and will satisfy the conditions of the problem; that is to say, GB will be equal to GK, wherever the point G is taken in the line DE: the same is true if F coincide with K'. Thus we have an instance of a problem, and that too a very simple one, which, in general, admits but of one solution; but which, in one particular case, when a certain relation takes place among the things given, becomes indefinite, and admits of innumerable solutions. The proposition which results from this case of the problem is a porism, and may be thus enunciated:

"A circle ABC being given by position, and also a straight line DE, which does not cut the circle, a point K may be found, such, that if G be any point whatever in DE, the straight line drawn from G to the point K shall be equal to the straight line drawn from G touching the given circle ABC."

The problem which follows, appears to have led to the discovery of many porisms.

A circle ABC (fig. 2), and two points D, E, in a diameter of it being given, to find a point F in the circumference of the given circle, from which, if straight lines be drawn to the given points E, D, these straight lines shall have to one another the given ratio of α to β, which is supposed to be that of a greater to a less. Suppose the problem resolved, and that F is found, so that FE has to FD the given ratio of α to β; produce EF towards G, bisect the angle EFD by FL, and DFG by FM: therefore $EL : LD :: EF : FD$, that is in a given ratio, and since ED is given, each of the segments EL, LD, is given, and the point L is also given; again, because DFG is bisected by FM, $EM : MD :: EF : FD$, that is, in a given ratio, and therefore M is given. Since DFL is half of DFE, and DFM half of DFG, therefore LFM is half of (DFE + DFB), that is, the half of two right angles, therefore LFM is a right angle; and since the points L, M, are given, the point F is in the circumference of a circle described upon LM as a diameter, and therefore given in position. Now the point F is also in the circumference of the given circle ABC, therefore it is in the intersection of the two given circumferences, and therefore is found. Hence this construction: Divide ED in L, so that EL may be to LD in the given ratio of α to β, and produce ED also to M, so that EM may be to MD in the same given ratio of α to β; bisect LM in N, and from the centre N with the distance NL, describe the semicircle LFM; and the point F, in which it intersects the circle ABC, is the point required.

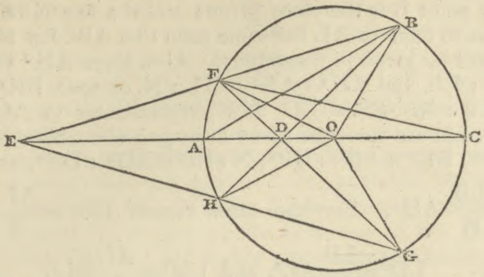
Fig. 2.



The synthetical demonstration is easily derived from the preceding analysis. It must, however, be remarked, that the construction fails when the circle LFM falls either wholly within or wholly without the circle ABC, so that the circumferences do not intersect; and in these cases the problem cannot be solved. It is also obvious that the construction will fail in another case, viz. when the two circumferences LFM, ABC, entirely coincide. In this case, it is farther evident, that every point in the circumference ABC will answer the conditions of the problem, which is therefore capable of numberless solutions, and may, as in the former instance, be converted into a porism. We are now to inquire, therefore, in what circumstances the point L will coincide with A, and also the point M with C, and of consequence the circumference LFM with ABC. If we suppose that they coincide, $EA : AD :: \alpha : \beta :: EC : CD$, and $EA : EC :: AD \cdot CD$, or by conversion, $EA : AC :: AD : CD - AD :: AD : 2DO$, O being the centre of the circle ABC; therefore, also, $EA : AO :: AD : DO$, and by composition, $EO : AO :: AO : DO$, therefore $EO \times OD = AO^2$. Hence, if the given points E and D (fig. 3), be so situated that $EO \times OD = AO^2$, and at the same time $\alpha : \beta :: EA : AD :: EC : CD$, the problem admits of numberless solutions; and if either of the points D or E be given, the other point, and also the ratio which will render the problem indeterminate, may be found. Hence we have this porism:

"A circle ABC, and also a point D being given, another point E may be found, such that the two lines inflected from these points to any point in the circumference ABC,

Fig. 3.



shall have to each other a given ratio, which ratio is also to be found." Hence also we have an example of the derivation of porisms from one another, for the circle ABC, and the points D and E remaining as before, if, through D we draw any line whatever HDB, meeting the circle in B and H; and if the lines EB, EH, be also drawn, these lines will cut off equal circumferences BF, HG. Let FC be drawn, and it is plain from the foregoing analysis, that the angles DFC, CFB, are equal; therefore if OG, OB, be drawn, the angles BOC, COG, are also equal; and consequently the angles DOB, DOG. In the same manner, by joining AB, the angle DBE being bisected by BA, it is evident that the angle AOF is equal to AOH, and therefore the angle FOB to HOG; hence the arch FB is equal to the arch HG. It is evident that if the circle ABC, and either of the points DE were given, the other point might be found. Therefore we have this porism, which appears to have been the last but one of the third book of Euclid's *Porisms.* "A point being given, either within or without a circle given by position, if there be drawn, anyhow through that point, a line cutting the circle in two points; another point may be found, such, that if two lines be drawn from it to the points in which the line already drawn cuts the circle, these two lines will cut off from the circle equal circumferences."

The proposition from which we have deduced these two porisms, also affords an illustration of the remark, that the conditions of a problem are involved in one another in the porismatic or indefinite case; for here several independent conditions are laid down, by the help of which the problem is to be resolved. Two points D and E are given, from which two lines are to be inflected, and a circumference ABC, in which these lines are to meet, as also a ratio which these lines are to have to each other. Now these conditions are all independent of one another, so that any one may be changed without any change whatever in the rest. This is true in general; but yet in one case, viz. when the points are so related to another, that the rectangle under their distances from the centre is equal to the square of the radius of the circle, it follows, from the preceding analysis, that the ratio of the inflected lines is no longer a matter of choice, but a necessary consequence of this disposition of the points.

From what has been already said, we may trace the imperfect definition of a porism which Pappus ascribes to the later geometers, viz. that it differs from a local theorem, by wanting the hypothesis assumed in that theorem. Now, to understand this, it must be observed, that if we take one of the propositions called *loci,* and make the construction of the figure a part of the hypothesis, we get what was called by the ancient geometers, a *local theorem.* If, again, in the enunciation of the theorem, that part of the hypothesis which contains the construction be suppressed, the proposition thence arising will be a porism, for it will enunciate a truth, and will require to the full understanding and investigation of that truth, that something should be found, viz. the circumstances in the construction supposed to be omitted.

Thus, when we say, if from two given points, E, D, two straight lines EF, FD, are inflected to a third point F, so as to be to one another in a given ratio, the point F is in the circumference of a given circle, we have a locus. But when conversely, it is said, if a circle ABC, of which the centre is O, be given by position, as also a point E; and if D be taken in the line EO, so that $EO \times OD = AO^2$, and if from E and D the lines EF, DF be inflected to any point of the circumference ABC, the ratio of EF to DF will be given, viz. the same with that of EA to AD, we have a local theorem.

Lastly, when it is said, if a circle ABC be given by position, and also a point E, a point D may be found, such that if EF, FD be inflected from E and D to any point F in the circumference ABC, these lines shall have a given ratio to one another, the proposition becomes a porism, and is the same that has just now been investigated.

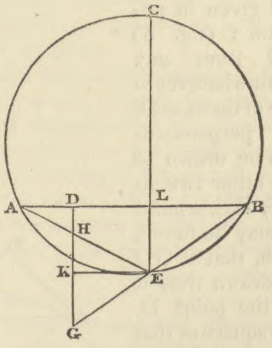
Hence it is evident, that the local theorem is changed into a porism, by leaving out what relates to the determination of D, and of the given ratio. But though all propositions formed in this way from the conversion of loci, are porisms, yet all porisms are not formed from the conversion of loci; the first, for instance, of the preceding, cannot, by conversion, be changed into a locus; therefore Fermat's idea of porisms, founded upon this circumstance, could not fail to be imperfect.

If the idea which we have given of these propositions be just, it follows, that they are to be discovered by considering those cases in which the construction of a problem fails, in consequence of the lines which by their intersection, or the points which by their position, were to determine the problem required, happening to coincide with one another. A porism may therefore be deduced from the problem to which it belongs, just as propositions concerning the *maxima* and *minima* of quantities are deduced from the problems of which they form limitations; and such is the most natural and obvious analysis of which this class of propositions admits.

Another general remark which may be made on the analysis of porisms is, that it often happens that the magnitudes required may all, or a part of them, be found by considering the extreme cases; but for the discovery of the relation between them, and the indefinite magnitudes, we must have recourse to the hypothesis of the porism in its most general or indefinite form; and must endeavour so to conduct the reasoning, that the indefinite magnitudes may at length totally disappear, and leave a proposition asserting the relation between determinate magnitudes only.

For this purpose accordingly Dr. Simson frequently employs two statements of the general hypothesis, which he compares together. This double statement, however, cannot be made without rendering the investigation long and complicated; nor is it even necessary, for it may be avoided by having recourse to simpler *porisms,* or to *loci,* or to propositions of the *data.* The porism which follows, is given as an example where this is done with some difficulty, but with considerable advantage, both with regard to the simplicity and shortness of the demonstration. It will be proper to premise the following lemma.

Fig. 4.



Let AB (fig. 4.) be a straight line, and D, L any two points in it, one of which D is between A and B; also let CL be any straight line. Then shall

$$\frac{LB}{CL}\cdot AD^2+\frac{LA}{CL}\cdot BD^2=\frac{LB}{CL}\cdot AL^2+\frac{LA}{CL}\cdot BL^2+\frac{AB}{CL}DL^2.$$

For place CL perpendicular to AB, and through the points

Porism.

A, C, B describe a circle, and let CL meet the circle again in E, and join AE, BE. Also draw DG parallel to CE, meeting AE and BE in H and G, and draw EK parallel to AB. Then, from the elements of geometry,

$$CL : LB :: (LA : LE ::)\ LA^2 : LA \times LE,$$

$$\text{and hence } LA \times LE = \frac{LB}{CL} \cdot LA^2.$$

$$\text{Also } CL : LA :: (LB : LE ::)\ LB^2 : LB \times LE,$$

$$\text{and hence } LB \times LE = \frac{LA}{CL} \cdot LB^2.$$

$$\text{Now } CL : LB :: LA : LE :: EK \text{ or } LD : KH,$$

$$\text{and } CL : LA :: LA : LE :: EK \text{ or } LD : KG,$$

$$\text{therefore, } CL : AB :: (LD : GH ::)\ LD^2 : EK \times GH,$$

$$\text{and hence } EK \times GH = \frac{AB}{CL} \cdot LD^2.$$

From the three equations now deduced, there results

$$\frac{LB}{LC} . LA^2 + \frac{LA}{LC} . LB^2 + \frac{AB}{CL} . LD^2 = AB \times LE + EK \times GH.$$

Again, because

$$CL : LA :: (LB : LE :: DB : DG ::)\ DB^2 : DB \times DG,$$

therefore $DB \times DG = \frac{LA}{CL} \cdot DB^2$. And because

$$CL : LB :: (LA : LE :: DA : DH ::)\ DA^2 : DA \times DH,$$

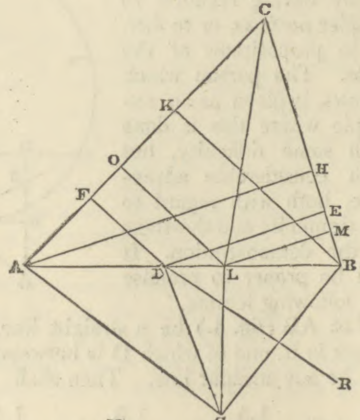
therefore $DA \times DH = \frac{LB}{CL} . DA^2$. From the result of these two last propositions we have

$$\frac{LB}{CL} \cdot DA^2 + \frac{LA}{CL} DB^2 = DA \times DH + DB \times DG;$$

But $DA \times DH =$ *twice trian.* ADH, and $DB \times DG =$ *twice trian.* BDG, and therefore $DA \times DH + DB \times DG = 2$ (*trian.* ADH + *trian.* BDG) = 2 (*trian.* AEB + *trian.* HEG) $= AB \times LE + EK \times HG$. Now it has been proved, that $DA \times DH + DB \times DG = \frac{LB}{CL} \cdot DA^2 + \frac{LA}{CL} . BD^2$, and that $AB \times LE + EK \times HG = \frac{LB}{CL} \cdot LA^2 + \frac{LA}{CL} \cdot LB^2 + \frac{AB}{CL} \cdot LD^2$, therefore $\frac{LB}{CL} \cdot AD^2 + \frac{LA}{CL} BD^2 = \frac{LB}{CL} \cdot AL^2 + \frac{LA}{CL} \cdot BL^2 + \frac{AB}{CL} \cdot DL^2$, as was to be demonstrated.

Porism. Let there be three straight lines AB, AC, CB given in position; (fig. 5) and from any point whatever in one of them, as D, let perpendiculars be drawn to the other two, as DF, DE, a point G may be found, such, that if GD be drawn from it to the point D, the square of that line shall have a given ratio to the sum of the squares of the perpendiculars DF and DE, which ratio is to be found.

Fig. 5.



Draw AH, BK perpendicular to BC and AC; and in AB take L, so that $AL : LB :: AH^2 : BK^2 :: AC^2 : CB^2$. The point L is therefore given; and if a line N be taken, so as to have to AL the same ratio that AB^2 has to AH^2, N will be given in magnitude. Also, since $AH^2 : BK^2 :: AL : LB$, and $AH^2 : AB^2 :: AL : N$, *ex equo*, $BK^2 : AB^2 :: LB : N$. Draw LO, LM perpendicular to AC, CB; LO, LM are therefore given in magnitude. Now, because $AB^2 : BK^2 :: AD^2 : DF^2$, $N : LB :: AD^2 : DF^2$, and $DF^2 = \frac{LB}{N} \cdot AD^2$. For the same reason $DE^2 = \frac{AL}{N} \cdot BD^2$.

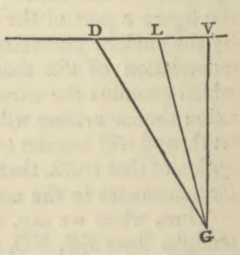
$$LO^2 = \frac{LB}{N} \cdot AL^2, \text{ and } LM^2 = \frac{AL}{N} \cdot BL^2.$$

But, by the preceding lemma, $\frac{LB}{N} \cdot AD^2 + \frac{AL}{N} \cdot BD^2 = \frac{LB}{N} \cdot AL^2 + \frac{AL}{N} \cdot BL^2 + \frac{AB}{N} \cdot DL^2$; that is, $DE^2 + DF^2 = LO^2 + LM^2 + \frac{AB}{N} \cdot DL^2$. Join LG, then by hypothesis $LO^2 + LM^2$ has to LG^2, the same ratio as $DF^2 + DE^2$ has to DG^2; let it be that of R to N, then $LO^2 + LM^2 = \frac{R}{N} . LG^2$; and therefore $DE^2 + DF^2 = \frac{R}{N} . LG^2 + \frac{AB}{N} . DL^2$; but $DE^2 + DF^2 = \frac{R}{N} . DG^2$; therefore, $\frac{R}{N} . LG^2 + \frac{BA}{N} . DL^2 = \frac{R}{N} . DG^2$, and $\frac{AB}{N} . DL^2 = \frac{R}{N} (DG^2 - LG^2)$; therefore $DG^2 - LG^2$ has to DL^2 a constant ratio, viz. that of AB to R. The angle DLG is therefore a right angle, and the ratio of AB to R that of equality, otherwise LD would be given in magnitude, contrary to the supposition. LG is therefore given in position: and since $R : N :: AB : N :: LO^2 + LM^2 : LG^2$; therefore the square of LG, and consequently LG, is given in magnitude. The point G is therefore given, and also the ratio of $DE^2 = DF^2$ to DG^2, which is the same with that of AB to N.

The construction easily follows from the analysis, but it may be rendered more simple; for since $AH^2 : AB^2 :: AL : N$, and $BK^2 : AB^2 :: BL : N$; therefore $AH^2 + BK^2 : AB^2 :: AB : N$. Likewise, if AG, BG, be joined, $AB : N :: AH^2 : AG^2$, and $AB : N :: BK^2 : BG^2$; wherefore, $AB : N :: AH^2 + BK^2 : AG^2 + BG^2$, but it was proved that $AB : N :: AH^2 + BK^2 : AB^2$, therefore $AG^2 + BG^2 = AB^2$; therefore the angle AGB is a right angle, and $AL : LG :: LG : LB$. If therefore AB be divided in L, so that $AL : LB :: AH^2 : BK^2$; and if LG, a mean proportional between AL and LB, be placed perpendicular to AB, G will be the point required.

The step in the analysis, by which a second introduction of the general hypothesis is avoided, is that in which the angle GLD is concluded to be a right angle; which follows from $DG^2 - GL^2$ having a given ratio to LD^2, at the same time that LD is of no determinate magnitude. For, if possible, let GLD be obtuse, (fig. 6,) and let the perpendicular from G to AB meet in V, therefore V is given: and since $GD^2 - LG^2 = LD^2 \times 2DL \times LV$; therefore, by the supposition, $LD^2 + 2\,DL \times LV$ must have a given ratio to LD^2; therefore the ratio of LD^2 to $DL \times VL$, that is, of LD to VL, is given, so that VL being given in magnitude, LD is also given. But this is contrary to the supposition; for LD is indefinite by hypothesis, and therefore GLD cannot be obtuse,

Fig. 6.



Porism.

nor any other than a right angle. The conclusion that is here drawn immediately from the indetermination of LD would be deduced, according to Dr. Simson's method, by assuming another point D′ any how, and from the supposition that $GD'^2-GL^2 : LD'^2 :: GD^2-GL^2 : LD^2$, it would easily appear that GLD must be a right angle, and the ratio that of equality.

These porisms facilitate the solution of the general problems from which they are derived. For example, let three straight lines AB, AC, BC, (fig. 5), be given in position, and also a point R, to find a point D in one of the given lines, so that DE and DF being drawn perpendicular to BC, AC, and DR, joined; DE^2+DF^2 may have to DR^2 a given ratio. It is plain, that having found G, the problem would be nothing more than to find D, such that the ratio of GD^2 to DR^2, and therefore that of GD to DR, might be given, from which it would follow, that the point D is in the circumference of a given circle, as is well known to geometers.

The same porism also assists in the solution of another problem. For if it were required to find D such that DE^2+DF^2 might be a given space; having found G, DG^2 would have to DE^2+DF^2 a given ratio, and DG would therefore be given; whence the solution is obvious.

The connection of this porism with the impossible case of the problem is evident; the point L being that from which, if perpendiculars be drawn to AC and CB, the sum of their squares is the least possible. For since $DF^2+DE^2 : DG^2 :: LO^2+LM^2 : LG^2$; and since LG is less than DG, LO^2+LM^2 must be less than DF^2+DE^2.

It is evident from what has now appeared, that in some instances at least there is a close connection between these propositions and the *maxima* or *minima*, and of consequence the impossible cases of problems. The nature of this connection requires to be farther investigated, and is the more interesting because the transition from the indefinite to the impossible case seems to be made with wonderful rapidity. Thus in the first proposition, though there be not properly speaking an impossible case, but only one where the point to be found goes off *in infinitum*, it may be remarked, that if the given point F (fig. 1), be anywhere out of the line HD, the problem of drawing GB equal to GF is always possible, and admits of just one solution; but if F be in DH, the problem admits of no solution at all, the point being then at an infinite distance, and therefore impossible to be assigned. There is, however, this exception, that if the given point be at K in this same line, DH is determined by making DK equal to DL. Then every point in the line DE gives a solution, and may be taken for the point G. Here therefore the case of numberless solutions, and of no solution at all, are as it were *conterminal*, and so close to one another, that if the given point be at K the problem is indefinite; but if it remove ever so little from K, remaining at the same time in the line DH, the problem cannot be resolved. This affinity might have been determined *a priori*; for, as we have seen, it is a general principle, that a problem is converted into a porism when one or when two of the conditions of it necessarily involve in them some one of the rest. Suppose, then, that two of the conditions are exactly in that state which determines the third; then whilst they remain fixed or given, should that third one vary or differ ever so little from the state required by the other two, a contradiction will ensue. Therefore if, in the hypothesis of a problem, the conditions be so related to one another as to render it indeterminate, a porism is produced; but if, of the conditions thus related to one another, some one be supposed to vary, whilst the others continue the same, an absurdity follows, and the problem becomes impossible. *Wherever, therefore, any problem admits both of an indeterminate and an impossible case, it is certain, that these cases are nearly related to one another, and that some of the conditions by which they are produced are common to both.*

It is supposed above, that *two* of the conditions of a problem involve in them a third; and wherever that happens, the conclusion which has been deduced will invariably take place. But a porism may in some cases be so simple as to arise from the mere coincidence of *one* condition with another, though in no case whatever can any inconsistency take place between them. There are, however, comparatively few porisms so simple in their origin, or that arise from problems where the conditions are but little complicated; for it usually happens that a problem which can become indefinite may also become impossible; and if so, the connection already explained never fails to take place.

Another species of impossibility may frequently arise from the porismatic case of a problem which will affect in some measure the application of geometry to astronomy, or any of the sciences depending upon experiment or observation. For when a problem is to be resolved by means of data furnished by experiment or observation, the first thing to be considered is, whether the data so obtained be sufficient for determining the thing sought; and in this a very erroneous judgment may be formed, if we rest satisfied with a general view of the subject. For though the problem may in general be resolved from the data with which we are provided, yet these data may be so related to one another in the case under consideration, that the problem will become indeterminate, and instead of one solution will admit of an indefinite number. This we have already found to be the case in the foregoing propositions. Such cases may not indeed occur in any of the practical applications of geometry; but there is one of the same kind which has actually occurred in astronomy. Sir Isaac Newton, in his *Principia*, has considered a small part of the orbit of a comet as a straight line described with an uniform motion. From this hypothesis, by means of four observations made at proper intervals of time, the determination of the path of the comet is reduced to this geometrical problem. Four straight lines being in position, it is required to draw a fifth line across them, so as to be cut by them into three parts, having given ratios to one another. Now this problem had been constructed by Dr. Wallis and Sir Christopher Wren, and also in three different ways by Sir Isaac himself in different parts of his works; yet none of these geometers observed that there was a particular situation of the lines in which the problem admitted of innumerable solutions; and this happens to be the very case in which the problem is applicable to the determination of the comet's path, as was first discovered by Boscovich, who was led to it by finding, that in this way he could never determine the path of a comet with any degree of certainty.

The preceding account of this interesting branch of the ancient geometry, is taken from a very elegant and elaborate paper, *On the Origin and Investigation of Porisms*, by the late Professor Playfair, published in the third volume of the Transactions of the Royal Society of Edinburgh, and also in his collected *Works*, (vol. iii. p. 178.) For further particulars on the subject, the reader may consult the original paper of Professor Playfair; Dr. Simson's treatise, *De Porismatibus*, contained in his *Opera Reliqua*; a paper in the fourth volume of the Edinburgh Transactions, by Professor Wallace, entitled, *Some Geometrical Porisms, with examples of their application to the Solution of Problems*; Dr. Traill's *Account of the Life and Writings of Robert Simson, M.D.*; and Professor Leslie's *Geometrical Analysis*. At the end of Dr. Stewart's *General Theorems*, above mentioned, five very remarkable porisms are enunciated, the demonstration of the first of which is given in Leybourn's *Mathematical Repository*, (vol. i.) and of the remaining four in the fifth volume of the same work published in 1830. The algebraic analysis may frequently be applied with great advantage in the investigation of porisms, but this manner of treating the subject does not come within the scope of the present article.

POROS (anciently *Sphæria*), an island of Greece, at the S.E. entrance of the Gulf of Ægina, separated from the mainland by a narrow channel. It is hilly and of volcanic origin. A town of the same name occupies a singular position among the dark-coloured rocks on the south coast. Poros is the national arsenal of Greece, and has a small naval yard and a harbour between the island and the mainland. Pop. 7000, chiefly Albanians.

PORPHYREON (Πορφυρέων ; Eth. Πορφυρεώνιος, Πορφυρεωνίτης), a city of Phœnicia, referred to by Scylax, situated between Berytus and Sidon, and marked in the Jerusalem Itinerary (where it is written *Parphirion*), as 8 Roman miles north of Berytus. Procopius speaks of it as a village built upon the coast. (*Hist. Arc.*, c. 30, p. 164.) Polybius mentions it, and relates that it was situated in the neighbourhood of Platanus. It would seem accordingly to be correctly placed at the *Khân Neby Yûnas*, where Pococke records that he witnessed numerous broken pillars, a Corinthian capital, and various ruins on each side of a mountain torrent. In the side of this mountain there are tombs, extensively excavated, at the back of the Khân, which must once have belonged to an ancient city. Porphyreon was made a bishopric under the metropolitan of Tyre; and Justinian is said to have erected a church to the Virgin at that place. (Robinson's *Bib. Researches*, vol. iii.)

PORPHYRY (Πορφύριος), a celebrated Neo-Platonist, and an antagonist of Christianity, was born at Tyre, of a distinguished family, in A.D. 233. His original name was *Malchus*, a word signifying king; but he received his usual designation, in allusion to the colour of his robes, from his master Longinus. When very young he was placed under the instruction of Origen, most probably at Cæsarea. On removing to Athens, he took lessons from Apollonius and Longinus. At the age of twenty he went to Rome to visit Plotinus, but finding that the latter had closed his instructions there, he returned to the East. For the next ten years of his life nothing is known regarding him. Plotinus having returned to Rome, Porphyry, then in his thirtieth year, joined Antonius of Rhodes, and went in quest of the great Neo-Platonist. Among his earliest works in the city of Rome was to assail a dogma of Plotinus in a written treatise. Amelius, the pupil and friend of Plotinus, drew up a reply, which was met by Porphyry, and a rejoinder was called for from Amelius. This rejoinder satisfied the inquirer, and he wrote a recantation. Porphyry gained so thoroughly the confidence and approbation of Plotinus that he was regarded by the latter as the ornament of his school. The Tyrian had assigned to him the task of correcting and arranging the writings of his master. After a six years' acquaintanceship, Porphyry, at the advice of Plotinus, retired to Sicily. Here he occupied himself, according to Eusebius, in writing his treatise against the Christian religion, in 15 books. He subsequently visited Carthage, and ultimately settled at Rome, where his instructions were held in great esteem by the Senate and the people. He married Marcella, a widow with seven children, when far advanced in life, to enjoy, as he expressed it, the pleasure of superintending their education. Ten months after his marriage he had occasion to leave home, and wrote to his wife a consolatory epistle, which is still extant. Porphyry probably died about A.D. 305 or 306.

The philosophical doctrines of Porphyry were in all respects identical with those of Plotinus. He was a man of great abilities and very extensive learning. Yet he is charged with inconsistencies and contradictions. As a writer he is tolerably clear; and not unfrequently exhibits strokes of vigorous imagination. Though much less confused than his master, he was likewise much less profound. Of the very numerous writings of Porphyry nineteen are still extant in whole or in part, including his works on portions of Aristotle; while no less than thirty-seven are said to be lost. (Fabric. *Bibl. Græc.*, vol. v.; Ritter, *Geschichte der Philosophie*, vol. iv.; and Smith's *Dictionary of Greek and Roman Biog. and Myth.*)

PORSĔNA, or PORSĒNNA, LARS, king of the Etruscan town of Clusium, plays an important part in one of the Roman wars as narrated by Livy. Espousing the cause of the expelled Roman monarch Tarquin the Proud, he advanced southward towards the banks of the Tiber at the head of a formidable army. The terrified rustics fled before him, carrying the news of his approach to the Roman forces on the Janiculum; the Roman forces at his first appearance retreated in panic across the Pons Sublicius; and the capture of the city seemed to be already within his reach. Yet at this juncture he began to find that although he could overwhelm the collected strength of Rome, he was no match for the indomitable spirit that animated each individual of the race. Horatius Cocles, bringing up the rear of the fugitives, stopped up the entrance to the bridges with his body; kept back the pressing pursuers with the prowess of his single arm; and not until his countrymen had all crossed, and the bridge had been broken down behind him, did he throw himself into the Tiber and swim to the other side amidst a continuous shower of arrows. The enemy was thus compelled to sit down on the further side of the river, and turn the attack into a blockade. But even in that safe position, and in the character of a conqueror and besieger, the king was again destined to be foiled by a simple citizen of Rome. One day, as he was sitting in his tent surrounded by attendants, his secretary was struck down by his side. The assassin was seized, and was discovered to be a Roman in disguise. On being arraigned, he fearlessly confessed that his name was Caius Mucius; that he had come with the intent of slaying the king, but had mistaken his victim; and that there were many other youths in Rome who had sworn to repeat, if necessary, the same attempt. On being threatened with torture, he thrust his hand in among the live coals on the altar, held up his flaming fingers before them, and told them to try torture if they thought it could have any effect. The king, despairing of conquering a state which contained such citizens as Caius Mucius and Horatius Cocles, immediately came to terms with the besieged. The Romans agreed to restore the land which they had taken from the Veientines, and Porsena receiving hostages, raised the blockade, and returned to Clusium.

This story of Porsena, however, receives from other authors a colouring considerably different from that which Livy gives it. Tacitus relates that the city was actually captured. Pliny gives us to understand that the citizens were so thoroughly crushed, that they durst not use iron for any other purpose than agriculture. From Dionysius of Halicarnassus we infer that the Romans sent to the Etruscan king, as an acknowledgment of their vassalage, an ivory throne, and other insignia of royalty. Taking the combined evidence of those writers, as well as additional grounds, Niebuhr and other modern historians conclude, that Porsena really subdued the Romans, and instead of receiving the territory of the Veientines by negotiation, actually wrested it with the strong hand of a conqueror.

PORSON, RICHARD, the greatest verbal critic and classical scholar of modern times, born on the 25th of December 1759, was the son of Huggin Porson, parish clerk of East Ruston, near North Walsham, in Norfolk. His father taught him, in his childhood, to practise all the common rules of arithmetic by memory only; and, before he was nine years old, he had learned to extract the cube root in this manner. At the same time, for teaching him to read and write, he employed the method which has since been generally introduced into the schools of mutual instruction, making him draw the letters with chalk or on sand; and the neatness and accuracy of his hand-writing, for which he was distinguished through life, may be considered as bearing ample testimony to his father's ingenuity and success.

At the age of nine he was sent to a village school, kept by a Mr Summers; but his father still made him repeat by heart in the evening the whole of the lessons of the day; and there seems to be sufficient evidence for considering this practice of exercising the memory continually, in very early life, as the best, if not the only method of cultivating, if not of producing great talent. Mr Hewitt, the vicar of the parish of East Ruston, hearing of young Porson's uncommon capacity, undertook to instruct both him and his brother Thomas in classical literature; and when he was about fifteen, Mr Norris, a wealthy and respectable gentleman of the neighbourhood, having ascertained the truth of the reports that he heard of him, resolved to be at the expense of sending him to Eton.

At Eton his talents procured him the friendship and admiration of the seniors amongst his school-fellows, and upon the unfortunate death of his first patron, Mr Norris, he found a number of liberal contributors, who stept forward to supply the deficiency; but by far the most active of them was Sir George Baker, then president of the Royal College of Physicians, a man as much distinguished by his own classical taste and acquirements, as by his laudable disposition to cherish learning in others. He received the boy into his house for a vacation, and undertook, at the request of a relation of Mr Norris, the disagreeable task of receiving, in small sums, as much as was sufficient to purchase an income of L.80 a year, for a few years, in the short annuities, which served, with great economy, to enable him to remain at Eton. This favour appears to have been too great to be properly acknowledged, or perhaps even duly appreciated, by its object, who only after many years paid Sir George the tardy compliment of a dedication, not, however, of an edition, but of a handsome copy of a single play of Euripides. In his own opinion, Porson learned little at Eton besides the quantity of syllables, being able to repeat by heart before he went there the principal part of the authors that he had to read,—that is, almost the whole of Horace and Virgil, the *Iliad*, and many parts of Cicero, Livy, and the *Odyssey*. A story is accordingly told of his book having been changed by one of his schoolfellows in joke, when he was going up to a lesson in Horace, and of his having read and translated what was required of him, without at all betraying the change to his master. At the same time, the emulation of a public school must have been a great advantage to him, as affording him a motive for exertion in his exercises, whether they were to be called his own, or to be written for other boys. It was a copy of Toup's *Longinus*, presented to him as a reward for a good exercise, that first gave him a decided inclination for the pursuit of critical researches; but he always considered Bentley and Dawes as his great masters in criticism.

In 1777 he was sent to Trinity College, Cambridge, and at first he began to apply more particularly to the mathematics, which had been the favourite study of his boyhood, and in which, as he himself remarked, his proficiency first brought him into a certain degree of public notice. He was, however, soon diverted from this pursuit, although he attained a place amongst the *senior optimes* of his year. But he was in fact more calculated for classical than for mathematical excellence. His memory would have been in a great measure thrown away if he had been employed in abstract calculations; and his inventive powers do not appear to have been at all of the same class with his retentive faculties; although certainly in the mechanical pursuit of the fashionable methods of modern analysis, which are intended, like steam-engines, to overcome all difficulties by the inanimate force of mere patience and perseverance, he was capable of filling as distinguished a place as any living algebraist. The classical prize medal, and the university scholarship, he obtained without difficulty, as matters of course. The exercise which he exhibited upon the examination for the scholarship is the well-known translation of an epitaph into Greek iambics; which, although not free from some inaccuracies in the use of the tenses, is still a very remarkable production, when it is considered as having been completed in less than an hour, with the help of Morrell's *Thesaurus* only, and never afterwards corrected.

He obtained a fellowship of Trinity College in 1781, and took his degree of Master of Arts in 1785; but not thinking it right to subscribe the Articles of the Church of England, he could not enter into orders, and he was therefore unavoidably deprived of his fellowship in 1791, having no dependence left for his subsistence through life but his own abilities and acquirements. His friends, however, did not abandon him on this urgent occasion, and in order to keep him out of actual want, a private subscription was set on foot, to which Mr Cracherode was one of the principal contributors, and by which enough was raised to purchase him an annuity of about L.100 a year for life. A small addition was made to his income, about two years afterwards, by his election to the Greek professorship at Cambridge, with a salary of only L.40 a year. The situation, however, gave him the option of at least doubling his whole receipts, by the delivery of an annual course of lectures in the university; and it was supposed that he would have made this exertion, if he had not been discouraged by the difficulty of obtaining rooms in his college, where it would have been his wish to reside.

Porson married in 1795, Mrs Lunan, a sister of the late Mr Perry, well known as the editor of the *Morning Chronicle*, but he had the misfortune to lose his wife two years afterwards. Perry continued to be his greatest friend through life, and was so far his best benefactor, as he knew how to oblige him essentially, without the appearance of doing him a favour. Porson had sometimes chambers in the Temple, and sometimes he lodged at the *Morning Chronicle* office; frequently also he was a visitor at Perry's house at Merton, where he had the misfortune to leave several of his books at the time of a fire, which destroyed them all, and amongst them some letters of Rhunkenius, with whom he had begun a correspondence in 1783, and who had committed to him some valuable fragments of Æschylus, besides his manuscript copy of the Lexicon of Photius, which had cost him ten months' labour. He used indeed to say that this fire had destroyed the fruits of twenty years of his life; but he had the resolution to complete a second copy of the Photius, which is now in the library of Trinity College. His fondness for the mechanical employment of his pen has been regretted by some of his biographers, as having tempted him to waste much of his most valuable time on a trifling amusement; but in fact, his mode of writing Greek was fully as much calculated for expedition as for beauty; and those who have not been in the habit of correcting mutilated passages of manuscripts can form no estimate of the immense advantage that is obtained by the complete sifting of every letter, which the mind involuntarily performs whilst the hand is occupied in tracing it; so that, if the correction of Photius was really worth the labour of two years of Porson's life, it would have been scarcely possible to employ the greater part of those years more advantageously than by copying him twice over. Mr Weston, in speaking of "his matchless penmanship," has observed, not very intelligibly, that "here, indeed, he thought himself surpassed by" another person "not in the stroke, but the sweep, of his letters." What Porson really said on this subject was, that, with respect to "command of hand," that person had the advantage, but he preferred the *model* on which his own hand was formed. His writing was, in fact, more like that of a scholar, whilst the method explained in Hodgkin's *Calligraphia* exhibits more the appearance of the work of a writing-master; holding, however a middle place between the neatness of Porson and the wonderful accuracy of the country schoolmaster who made the fac-simile of the Oxford Pindar in the British Museum.

Upon the establishment of the London Institution, his friends obtained for him the very desirable appointment of principal librarian, with a salary of L.200 a year, and apartments in the house of the Institution, which was then in the Old Jewry; but although the arrangement was highly honourable to all parties, the librarianship was little more than a sinecure. Porson was, however, in the habit of attending in his place when the reading-room was open, and of communicating very readily all the literary information that was required by those who consulted him respecting the object of their researches. Had the inhabitants of Finsbury Square and its neighbourhood been more disposed to classical studies, and had the librarian of the Institution survived to witness its completion and prosperity, his sphere of utility would without doubt have been greatly extended.

But it must ever be lamented that Porson's habits of life had unfortunately been such as to lay a foundation for a multitude of diseases. He suffered much from asthma throughout the year 1808; his memory began to fail him a little; and in the autumn he had had some symptoms of intermittent fever. On Monday the 19th of September he had an apoplectic attack in the street, and he was carried to a neighbouring poor-house in a state of insensibility. The next day an advertisement appeared in one of the papers, relating the accident, and describing some manuscripts which were found in his pocket, consisting of Greek fragments and algebraical characters. His friends at the London Institution immediately went in quest of him. He was afterwards well enough to appear in the library, and to receive a visit there from Dr Adam Clarke; but his speech was impaired, and his faculties evidently imperfect. He survived only through the week, and died in his forty-ninth year, on Sunday the 25th of September 1808, at midnight.

He was buried at Cambridge, in Trinity College chapel, near the grave of Bentley and the monument of Newton. He founded by will an annual prize, to be given to the best Greek translation from an English dramatic author; and several specimens of the successful pieces have been published from time to time in the *Classical Journal*. His books were sold by auction, and many of them found purchasers at high prices, especially such as were enriched with any of his manuscript notes in their margins; but more than two hundred of these, which appeared to be the most valuable, were withheld from the sale, and were afterwards purchased, together with the whole of his manuscript papers, by the Society of Trinity College, for the sum of a thousand guineas. He left a sister, married to Mr Siday Hawes, of Coltishall, Norfolk. His brother Thomas kept a boarding-school at Fakenham, and died without issue in 1792; his second brother, Henry, was a farmer in Essex, and died young, leaving three children. His father had lived to seventy-four, his mother to fifty-seven.

The principal works of Porson are his *Letters to Travis*, his four plays of Euripides with their prefaces, and the manuscript copy of Photius; the rest, though somewhat voluminous, are chiefly miscellaneous annotations upon detached passages of a multitude of ancient authors. We find nothing in the nature of theory, or of the discovery of general laws, except some canons, which he has laid down, chiefly as having been used by the Greek tragedians in the construction of their verses. These are chiefly contained in the preface to the *Hecuba*, together with its supplement. 1. The first is, that when a tragic iambic ends with a trisyllable or a cretic, this word must be preceded either by a short syllable or by a monosyllable. For example, an ancient tragedian would not have written the line Ἔχοι δὲ μήποτ' ἐξ ἀπευκτοῦ δώματος, though it might have been unexceptionable in a comedy. It seems to have been about the year 1790 that Porson first made this observation. He certainly did not attend to it in his own serious translation of the *Epitaph on Alexis;* but it was mentioned in 1791, by one of Porson's intimate friends, in a moment of conviviality, whilst he was somewhat characteristically attempting to fill his glass out of an empty bottle; and the author of this article observed in answer, that it would certainly sound better, on such an occasion as then occurred, to say, Πᾶν ἐκπέπωκας· οὐδ' ἜνεσΤΙ κότταβος, than οὐ λελειπΤΑΙ κότταβος. 2. The second canon is, that an anapaest is only admissible in a tragic iambic, as constituting the first foot, except in some cases of proper names. This, indeed, had been cursorily hinted by Dawes. 3. The same critic had also remarked, that the Attic poets never lengthen a short vowel before a mute or aspirate, followed by a liquid, or a middle consonant followed by ρ; and Porson more amply confirmed the observation as very generally, though not universally, correct. On the other hand, Dawes had cursorily observed that Homer and the other ancient epic poets generally lengthened the vowel in such cases; and Porson's great rival, Hermann, has more fully established this distinction as affording a good criterion of antiquity. 4. There are also some original remarks of Porson on the cæsura, in iambics, and trochaics, and anapaests. He showed that the scenic poets do not elide the final iota, and that the tragedians do not employ the preposition περὶ before a vowel; and some other general laws, of greater importance than these, may probably be found in some of his publications, which it will now be necessary to enumerate in the order of time.

1. His first attempts as an author consisted of some anonymous articles in Dr Maty's *Review*, beginning with a part of Shutz's *Æschylus*, June 1783, *Tracts*, ii. Brunck's *Aristophanes*, July 1783, *Tracts*, iii.; *Mus. Crit.* ii. 113; written in a day. In Latin, by Schäfer, *Class. Jour.* v. 136. Weston's *Hermesianax*, April 1784, *Tracts*, iv. Huntingford's *Apology for his Menostrophics*, August 1784, *Tracts*, v. *Account of the Learned Pig*, April 1785, *Tracts*, vi. Note, with letters of Le Clerc and Bentley, April 1786, *Tracts*, vii.

2. He added some Notes to an edition of Xenophon's *Anabasis*, published by Nicholson at Cambridge, 4to and 8vo, 1786. They are addressed *Lectori si quis erit.*

3. Three Panegyrical Epistles to Sir J. Hawkins, *Gent. Mag.*, August, September, and October 1787; *Tracts*, ix.

4. Notes on *Toupii Emendationes in Suidam.* Oxford, 8vo, 1790. Written in 1787.

5. Letters on the Three Witnesses, *Gent. Mag.*, Oct. and Dec. 1788; Feb., April, May, June, Aug. 1789; Feb. 1790. The last was reprinted in *Tracts*, xix.; most of the others in the collection of *Letters to Mr Archdeacon Travis*, in answer to his defence of the *Three Heavenly Witnesses*, London, 8vo, 1790. These letters are generally considered, by critics of all parties, as finally decisive of a question which had often been agitated before, but never so learnedly argued, nor so satisfactorily discussed in all its bearings.

6. In the *Monthly Review*, Robertson's *Essay on the Parian Chronicle*, Jan. 1789, *Tracts*, xiii.,—satisfactorily answering the principal part of the objections alleged against the authenticity of that monument. Edward's edition of the work attributed to Plutarch, *On Education*, July 1793, *Tracts*, xxi. Payne Knight's *Greek Alphabet*, Jan. 1794, *Tracts*, xxiii. Pybus's *Sovereign*, Dec. 1800; an article affording a good specimen of his talent for humour.

7. He is supposed to have written some remarks on an *Essay upon the Transfiguration*, but never expressly acknowledged them. *Tracts*, xv.

8. He added a few short Notes to the London edition of Heyne's *Virgil*, 8vo, 1793, for which he made an agreement with the bookseller to correct the press; but he complained that his corrections

were disregarded; and in fact several hundred errors, of no great importance, were suffered to disfigure it.

9. He corrected the Greek text of Æschylus for the Glasgow editions, the folio of 1795, and the two volumes octavo, printed in 1794, but only published at London in 1806. The folio is said to have appeared surreptitiously. There are more than two hundred original corrections, and a further number of passages pointed out as corrupt.

10. In the *Morning Chronicle* he published, at different times, a variety of spirited articles of a temporary nature. One of the most amusing was the Nursery Song in Greek iambics, 13th of April 1796, called *A Fragment of Sophocles*, and signed "S. England," in ridicule of Ireland's pretended discoveries.

11. *Imitations of Horace. Spirit of the Public Journals*, 1797; *Class. Jour.* iv. 97.

12. The first four plays of Euripides appeared separately at different periods. The *Hecuba*, London, 1797, 8vo; Cambridge, 1802, with a Supplement and additional Notes; which were also published separately, London, 1808. *Orestes*, London, 1798, 1811. *Phœnissæ*, London, 1799, 1811. *Medea*, Cambridge, 1801; London, 1812. The four together, London, 1822.

13. *Collation* of the Harleian manuscript of the *Odyssey* for the Grenville *Homer*, Oxford, 1800, 4to; with some short Notes. Reprinted, *Class. Jour.* ix.

14. Of the review of Wakefield's *Lucretius*, in the *British Critic* for May 1801, the principal part appears to be Porson's.

15. A Letter signed by J. N. Dawes, *Monthly Mag.*, Dec. 1802, on some Greek constructions; admitting also an inaccuracy of his own with respect to a hiatus pointed out by Mr C. Falconer.

16. A Letter to Professor Dalzel, dated September 1803 (*Mus. Crit.* i., p. 326), in answer to some remarks published in the Professor's *Collectanea Majora*; with an Epigram respecting Hermann, in Greek and in English.

17. *Herodotus*, Edinburgh, 1806. Porson corrected the press for the first volume.

18. Supplement to some Indices, *Tracts*, xxxvi.

19. It is well known that Porson bestowed considerable pains on the restoration of the text of the *Rosetta Stone*. His Supplements were added to the plates engraved by the Society of Antiquaries; and they also appear amongst his *Tracts*, xxxvii. In Dr Clarke's *Greek Marbles* (Cambridge, 1809, 8vo) we find a translation of this inscription, communicated to the editor by Porson, and printed from "a *corrected copy* in his own beautiful handwriting." But we may here venture to apply Porson's favourite remark on the facility of transposition, and to read "a *copy corrected* in his own writing," that is, on the margin of Mr Gough's translation, as published in Duane's *Coins*; for the whole is very negligently performed; and it is not a little remarkable that this translation, which was at least approved by Porson, is decidedly less accurate than the Latin translation of Heyne, as appears from the investigation of the enchorial inscription published in the sixth number of the *Museum Criticum*.

20. A variety of Porson's fugitive and miscellaneous pieces have re-appeared at different times in the *Classical Journal*. *Authors cited by the Scholiast on Plato*, ii. 619; *Tracts*, xxxviii. *The Epitaph*, iii. 233; more correctly than in the *Tracts*, but still with a gross error in the punctuation of the last line, which stands, in a manuscript copy of his own, Τέθνηχ', ὃ δὴ τάχιστα πάσχοντ' οἱ 'γαθοί. This reading, though not very elegant, is at least more defensible than to make πάσχειν alone signify to die, and a phrase to end with ὃ δή. A *Charade* in Latin, vii. 248. Some *Notes on Æschylus*, vii. 456; viii. 15, 181; x. 114. A property of the lines employed in the 47th proposition of the first book of *Euclid*, p. 401. *Notes on Apollonius Rhodius*, xviii. 370.

21. *Adversaria* (Cambridge, 1812, 8vo), consisting of Notes on the Greek Poets, selected from his manuscripts, and arranged by Professor Monk and Mr C. J. Bloomfield. The first article is an interesting *Lecture on Euripides*, delivered upon his appointment to the Greek professorship. It is followed by a few miscellaneous observations, and by a large collection of Notes on Athenæus, on Euripides, on the *Fragments of the Tragic and Comic Poets*, on Stobæus, and on a variety of poets of miscellaneous descriptions. The volume was reprinted at Amsterdam without any alteration, but the sale of the foreign edition has never been permitted in Great Britain.

22. *Tracts and Miscellaneous Criticisms*, collected and arranged by the Rev. T. Kidd, M.A.; London, 1815, 8vo. Besides the articles already noticed as reprinted in this volume, there are a few Notes on Dawes's *Miscellanea Critica*, not before published, No. 51. There are also some supplementary pages of Simplicius and Cebes, reprinted by Porson for the use of his friends, as restored by Schweighäuser. The want of this leaf of the manuscript of Simplicius had given rise to the mistaken assertion that Xenophon was proclaimed a public benefactor at the Olympic games, on occasion of the return of the Ten Thousand. There are likewise some miscellaneous Notes on Athenæus, Menander, and Philemon, Aristides, Pausanias, and the lexicographers; and some Indices of authors quoted by the Scholiasts.

23. *Notæ in Aristophanem*, quibus Plutum comœdiam adjecit P. P. Dobree. Cambridge, 1820, 8vo.

24. Gaisford *Lectiones Platonicæ*. Accedunt R. Porsoni *Notæ ad Pausaniam*. Oxford, 1820, 8vo.

25. *Photii Lexicon*. Cambridge, 1822, 8vo.

To attempt to form a just estimate of the merit of such a man as Porson, without servilely following the dictates of common fame, or blindly adopting the opinions of others, is a task of no small difficulty, even to one who had the advantage of his personal acquaintance for the last twenty years of his life. But it may safely be conceded to common fame and to partial friendship, that he was one of the greatest men, and the very greatest critic, of his own or of any other age. "Nothing came amiss," says Mr Weston, "to his memory. He would set a child right in his twopenny fable book, repeat the whole of the moral tale of the *Dean of Badajoz*, a page of Athenæus on cups, or of Eustathius on Homer, even though he did everything to impair his mental faculties." It cannot, however, be denied that the talents, and even the industry, that he possessed, might have made him a much greater man had they been employed in some other department of human intellect. He might *probably* have been as great a statesman or as great a general as he was a scholar, and in these capacities his acquirements would have affected the interests of a much greater multitude of his fellow-creatures than can ever be benefited by the fruits of his erudition; and he might *possibly* have gained more popularity as an orator or a poet than his refined investigations of grammar and prosody could ever procure him, although it is not by any means certain that his fancy and invention could have been rendered by any cultivation at all comparable to his memory and acuteness. But as far as regards the possession of a combination of the faculties which he did cultivate, he appears to have been decidedly the most successful of any man on record in the same department. On the other hand, it must be admitted that the subjects of his pursuits were in their nature incapable of raising a man to the first rank amongst the permanent benefactors of the human race; and, if we calmly consider the ultimate objects of prosody and metre, it will appear almost unfair to allow the discoverer of the prosodiacal rules adopted by the ancient poets in their melodrames and choruses, to rank so very high amongst the luminaries of an age, and yet to look down with so much contempt, as we are accustomed to do, on the character of a modern *dieu de la danse*, notwithstanding that he thought himself the third great man of his day, with Voltaire and the King of Prussia, for having given soul and sentiment to the measures and movements of the choric representations of the present times.

Amongst the talents of Porson, however, which were so far superior to the importance of the objects on which they were employed, we ought not, perhaps, to consider his remarkable strength of memory as the most to be envied, since many persons who have been possessed of singular and almost miraculous, not to say morbid, memories, have been but little distinguished by any other faculty. But it must be repeated, that Porson's judgment and acuteness were really almost paramount to his memory; and with the addition of these faculties, his memory naturally rendered him capable of much that would have been impossible without it.

The respect that is justly due to classical learning has frequently been exaggerated in this country, partly perhaps on account of the awe which is naturally entertained by an ingenuous mind for its instructors in the earliest studies, by which it is advanced towards maturity. And classical learning having most wisely been placed by our ancestors the foremost in the order of a liberal education, which is most commonly adopted in Great Britain, a personal as well as a general respect has been involuntarily paid to the characters of the individuals concerned, and to the dignity of all those who are engaged in similar occupations; besides that, the means being, by a most frequent inattention of the human mind, confounded with the end for which they are sought, the words and syllables, and the phrases and measures of the Greek and Latin authors, have often been the almost frivolous occupation of a valuable life, instead of that of a few of the years of boyhood, which it was intended to devote to them, and which could not have been so well engaged in any other way. It is, however, wholly unjust to stigmatize the study of the classics, and of languages in general, as being confined to words instead of things; for it is utterly impossible that words can be learned without the acquisition of a considerable degree of knowledge of the things to which they relate, and of the historical facts which they have been employed to express, and without an involuntary modelling of the mind to the elegance and elevation of sentiment which pervade the works of those authors who are habitually put into the hands of boys in the course of their elementary studies; an acquirement which is of still greater value to the orator and the statesman than the command of language, and facility of expression, and beauty of imagery, and power of reasoning, which he derives from a perfect familiarity with the great masters of antiquity. But granting all the respect that can possibly be claimed for ancient literature, we cannot but lament that such a man as Porson should have lived and laboured for nearly half a century, and yet have left little or nothing to the world that was truly and originally his own.

After the full admission of the very high rank which is due to the comparative merits of Porson's talents and acquirements, it may be thought almost idle, if not invidious, to dwell on any trifling exceptions to their magnitude. The English critics have been reproached, and not without some foundation, as paying too servile a deference to Porson's opinions; and it seems to have been very generally believed amongst them that it was scarcely possible for him to commit an error or an oversight.

Although Porson was in many respects irregular, and often idle, or even intemperate, yet what he did perform as a critic may be allowed to leave a large balance, at the end of his life, in favour of his general industry, when compared with that of most of his countrymen. It has indeed been asserted, and perhaps with truth (*Classical Journal*, xxi.), that "with things Porson appears to have possessed but a very inconsiderate acquaintance; and not a trace is to be found amidst his writings of that combination of universal encyclopædiacal knowledge with language learning which is so abundantly found in the *Dissertation on Phalaris*, and the countless pages of Scaliger, Salmasius, and Casaubon." Certainly, however, neither Salmasius nor Casaubon, with all their learning, much less Scaliger, with all his industry and parade, nor even Bentley himself, with all his talent and acuteness, was at all comparable to Porson in his own department, that is, as a sound, accurate, and refined Greek critic.

But it must be confessed that at Cambridge, even although Porson had resolved to make the classics his principal study, and although there had not yet been many instances of senior wranglers who were also senior medallists, it was scarcely reputable for a man with his undeniable abilities to be only the twenty-first of his year in mathematics. Amongst the literary objects also which afterwards engaged his attention, he might easily have found time for the study of some of the modern languages; and he might have derived essential benefit from it on many occasions of critical research. He had, indeed, read a good deal of French, but very little Italian. He had studied the Anglo-Saxon, but he knew nothing of the kindred dialects of the north of Europe, in which it is preserved almost entire; and he was wholly unacquainted with oriental literature. He might have profited materially by some of these studies, in deriving from them a clearer conception of the distinctions of the tenses than he seems to have possessed, and he might have enlightened us in no small degree, with respect to the history of languages and of nations, by such etymological investigations as his comprehensive mind, thus employed, would have rendered him peculiarly capable of pursuing with success.

It has been candidly and very truly admitted by a rival critic in Germany, that Porson committed fewer errors than almost any other person; but it is right to be aware that he has now and then committed some errors, even where he would have been expected to be the most correct. There is, for example, a very strange oversight in one of the criticisms contained in his early review of Weston's *Hermesianax*, which implies a palpable blunder with respect to the gender of a particle, *Ζωρὸν μετροῦσα θυῶν πορφυρέης Λυσβιον ἐὲ ὑέλου*, "the cup of purple glass, which *measured* the fragrant wine;" and even in a subsequent correction of the same passage, published in his *Adversaria*, he has changed the gender of an adjective in a way that is at least very unusual, if not wholly without example, *μετροῦν θυόεντα*. A mere omission, in a criticism on another author, would scarcely be called an error in an ordinary person; but in such a critic as Porson, it is very remarkable that he should have neglected to notice, in his catalogue of the *Errors of Le Clerc*, omitted by Bentley, (*Adv.* p. 291), the grossest of all Le Clerc's blunders, which is the quotation of the word *Hypophauli* or *semi-barbarous*, from Pollux, with the translation *Sartagines*, or *frying-pans;* whilst the real text of Pollux simply and plainly states that the *Teganismi* or *fricassations*, in the *Hippocomus Menander*, is *a semibarbarous word.* These instances, which have occurred in a very cursory perusal of some of Porson's works, would certainly not deserve to be noticed in a general sketch of his character, any otherwise than as exceptions to his perfect infallibility.

It can scarcely be considered as an imperfection in the constitution of Porson's mind, that he wanted that amiable vanity which is gratified by the approbation even of the most inconsiderable, and which delights to choose for its objects the most innocent and the most helpless of those who are casually present in society. It has been observed that he would neither give nor take praise; and when he was told that somebody had called him a giant in literature, he remarked that a man had no right to tell the height of that which he could not measure. In fact, having learned "to know how little can be known," it is not surprising that he found himself "without a second, and without a judge;" and that he was unwilling to affect a community of sentiment, and an interchange of approbation with those whose acquirements and opinions he felt that he had a right to despise. It might have been wiser, in some instances, to conceal this feeling; but, on the other hand, he had perhaps occasion for something of the habit of retreating into his conscious dignity, from his deficiency in those general powers of ephemeral conversation which are so valuable in mixed societies; for, with all his learning and all his memory, he was by no means prominent as a talker. He had neither the inclination nor the qualifications to be a fascinating story-teller, or to become habitually a parasite at the tables of the affluent; but he was the delight of a limited circle of chosen friends, possessing talent enough to appreciate his merits, and to profit by the information that he afforded them.

There has not yet been a Life of Porson that has collected all the particulars that would deserve to be recorded by a biographer who undertook the task on an extensive scale; but of detached documents there is no deficiency.

Kidd has pointed out almost every work in which his name has been mentioned. The most material articles relating to him will be enumerated here.

Morning Chronicle, 6th October 1808; *A Short Account of the late Mr Richard Porson, with some particulars relative to his extraordinary talents*, by an admirer of great genius (the Rev. S. Weston), Μηκέτι πάπταινε κόρσιον (*Look for nothing beyond him*), London, 1808, 8vo; re-published, with some additions, under the title of *Porsoniana, or Scraps from Porson's Rich Feast*, London, 1814, 8vo; Bloomfield's Sapphic Ode, *Class. Journ.* i. 1.; *Some anonymous Iambics*, p. 81; *Sale of his Library*, p. 385; *Athenæum*, iv. 426, 521; v. 55; *Class. Journ.* ix. 386; Savage's *Librarian*, i. 274; *Gentleman's Magazine*, lxxviii.; *Monthly Magazine;* Dr Adam Clarke's *Narrative; Class. Journ.* ii. 720; *Correspondence of Wakefield and Fox*, London, 1813, 8vo; Greek Epitaph, *Class. Journ.* xxiii. 179, making Porsōnum equal to Newtŏnus; Aitken's *General Biography*, x., London, 1815, 4to; Kidd's *Imperfect Outline*; *Tracts*, 1815; Chalmers's *Biographical Dictionary*, xxv., London, 1816. (T. Y.)

PORT, a harbour, river, or haven, formed either by nature or art to receive and shelter shipping from the storms of the open sea.

Port is also a name given on some occasions to the larboard or left side of the ship, as in the following instances: Thus, it is said, "the ship heels to port," that is, stoops or inclines to the larboard side. "Top the yard to port," the order to make the larboard extremity of a yard higher than the other. "Port the helm," the order to put the helm over the larboard side of the vessel. In all these senses this phrase appears intended to prevent any mistakes happening from the similarity of sounds in the words *starboard* and *larboard.*

Ports, the embrasures or openings in the side of a ship of war, wherein the artillery is ranged in battery upon the decks above and below.

PORTADOWN, a market-town of Ireland, in the county of Armagh, on the Upper Bann river, which is here crossed by a fine bridge 10 miles N.E. of Armagh, and 84 N. by W. of Dublin. It is well built and paved, containing a parish church in the early English style; also Presbyterian, Methodist, and Roman Catholic places of worship, endowed and national schools, a good market-house, a dispensary, and a loan society, which has done much for the encouragement of industry in the neighbourhood. The manufacture of linen, lawn, cambric, &c., gives employment to many of the inhabitants; and the town contains besides, large corn-mills, a manufactory of steam-engines and other machinery, and a soap and candle work. Markets for the sale of cattle, pork, and rural produce are held at Portadown on Saturdays; and there are also monthly and annual fairs. Pop. (1851) 3091.

PORTAFERRY, a seaport and market-town of Ireland, in the county of Down, near the entrance of Lough Strangford, 7 miles N.E. of Downpatrick. It contains places of worship belonging to the Established Church, the Presbyterians, Methodists, and Roman Catholics; two public schools, a market-house, and a dispensary. There are also here a distillery and a quay. Many of the women of the town are employed in embroidering muslin for the Glasgow market. An active trade is carried on in coal, timber, and agricultural produce. There is a ferry here across to Strangford, on the other side of the lough. Besides weekly markets, four annual fairs are held here. Pop. (1851) 2074.

PORTALEGRE, a town of Portugal, in the province of Alemtejo, on a hill in the midst of a beautiful and fertile region, containing extensive chestnut forests, 49 miles N.N.E. of Evora. It is walled, but derives its chief strength from its position. The streets are narrow, steep, and irregular; but the houses are in general well built. The chief buildings are the Gothic cathedral and episcopal palace. Woollen cloth is manufactured here; and timber and chestnuts are exported to Lisbon. Pop. 5800.

PORTARLINGTON, a market-town and parliamentary borough of Ireland, partly in King's and partly in Queen's County, on the Barrow, which is here crossed by two bridges, 44 miles W.S.W. of Dublin. The principal public buildings are two Protestant churches (one of which is a fine edifice with a lofty spire), a large Roman Catholic chapel, and a Methodist meeting-house, two national and two free schools, a market-house, dispensary, and savings-bank. Soap and candles are manufactured here; and there are eight annual fairs. The town was founded by Lord Arlington, from whom it derives its name; but afterwards it was forfeited to the crown, and under William III. it was settled by many French and Flemish Protestants, who built the two churches of the town. In one of these the service was conducted in French till 1817. Portarlington returns a member to Parliament. Pop. (1851) 2728.

PORT-AU-PRINCE. See Port Republicain.

PORTCULLIS (Fr. *coulisse*, from *couler*, to slip down), is an assemblage of several large pieces of wood, joined across one another like a harrow, and each pointed with iron at the bottom. They are sometimes hung over the gateway of old fortified towns and castles, ready to be let down in the case of surprise, when the gates cannot be shut.

PORT ELIZABETH, a seaport-town of Cape Colony, South Africa, on the W. shore of Algoa Bay, 18 miles S.E. of Uitenhage. It contains churches belonging to Episcopalians, Wesleyans, Independents, and Roman Catholics; an arsenal, court-house, and jail. There is a harbour, which is, next to Cape Town, the most frequented in the colony, and a pier projecting 350 feet into the sea. The commerce of Port Elizabeth is great, and rapidly increasing. The number of ships that entered the harbour in 1855 was 163, tonnage 26,914; those that cleared 160, tonnage 26,045. The total value of the imports in the same year was L.376,638, and that of the exports L.584,447. Pop. upwards of 4000.

PORTER, a kind of malt liquor which differs from ale and pale beer, in its being made with high-dried malt. (See Brewing.)

PORTER, Jane, a popular novelist, was born at Durham in 1776, and spent her childhood in Edinburgh. A love for the marvellous, and a sentimental admiration for human excellence, increased with her increasing strength, and fitted her for becoming a popular story-writer. Accordingly in 1803, after her removal to London, she entered upon a successful career as a novelist by the publication of *Thaddeus of Warsaw.* The book gained for her at once a European reputation. She saw it translated into several of the continental languages; she was elected a lady canoness of the Teutonic order of St Joachim; and she received from a relation of Kosciusko a gold ring containing the portrait of that hero. Scarcely less effective was her next important work, the *Scottish Chiefs*, published in 1809. It is true that it failed to realize the scenes, the costumes, the manners, and the characters of the story; yet to mere novel readers the melodramatic exploits and the astounding chivalry of Wallace and Bruce were profoundly affecting. The ablest, however, of all her publications was probably *Sir Edward Seaward's Diary*, which appeared in 1831. So life-like were the representations in that work of fiction that a grave and pompous critic mistook it for a professed historical treatise. He laboriously rummaged the dusty collections of Admiralty records and Indian maps to test the accuracy of the incidents, and solemnly and triumphantly refuted them in one of the leading reviews. The latter part of Miss Porter's life was spent in paying lengthened visits to her relations and numerous friends. She died in May 1850, at the house of her eldest brother, an eminent physician at Bristol. Anna Maria, the younger sister of Jane Porter, was the author of several popular novels.

Porter, *Sir Robert Ker*, a well-known artist and traveller, was the brother of the preceding, and was born at Durham in 1780. A determination to be a painter began to characterize him while passing his boyhood in Edinburgh. He persisted in making sketches from his own fancy, until his mother, in 1790, took him up to London and enrolled him among the students of the Royal Academy. A few years only had been spent there when he boldly made his appearance as an artist by profession. Several altar-pieces were painted, and were either sold or presented to several churches. The "Storming of Seringapatam," the "Siege of Acre," and the "Battle of Agincourt," all large pictures, were executed, and London was invited to see them exhibited. No enterprise, in fact, was too great for the youthful aspirant to attempt. Venturing to push his fortune in Russia, he procured the appointment of historical painter to the Czar in 1804, and won the hand of the daughter of Prince Theodore de Sherbatoff in 1811. By this time Porter had begun to enter upon a new and more exciting sphere of action. The winter of 1808–9 saw him sharing in the hardships and glories of the campaign of Sir John Moore. From 1817 to 1820 he was journeying in the East, and with the aid of both pen and pencil recording what he saw in his travels. Between 1826 and 1841 he was residing as British consul at Venezuela in South America. Leave of absence had been obtained, and he was paying a visit to St Petersburg, when a stroke of apoplexy suddenly carried him off in May 1842. Ker Porter, at the time of his death, had gained considerable reputation. The title of Knight Commander of the Order of Hanover, which had been conferred upon him in 1832, shows how much his talents as a warrior and a diplomatist were esteemed. His literary gifts were also well known from the following works:—*Travelling Sketches in Russia and Sweden*, in 2 vols. 4to, 1808; *Letters from Portugal and Spain*, 8vo, 1809; *Narrative of the late Campaign in Russia*, 4to, 1813; and *Travels in Georgia, Persia, Armenia, Ancient Babylonia, &c. &c., during the years* 1817–20, in 2 vols. 4to, 1821–22.

Porter, *George Richardson*, an eminent statist, was born in London in 1792, and was educated at Merchant Taylors' School. A failure which he made in the trade of a sugar-broker was the occasion of bringing him into notice. Driven to literature, he published a paper on Life Assurance in the *Companion to the Almanac* for 1831, which introduced him to the acquaintance of Mr Charles Knight. That well-known publisher was instrumental not long afterwards in procuring for him the office of superintendent of the statistical department in the Board of Trade. Placed in this congenial situation, he soon had the opportunity of showing to the best advantage his skill in digesting and tabulating the most incongruous materials. His great work, *The Progress of the Nation*, which he began to publish in 1836, established his reputation as a statist. His growing skill in his official duties also recommended him in 1841 to the post of one of the joint secretaries of the Board of Trade. He was still holding this situation when he died at Tunbridge Wells in 1852, in consequence of inflammation, which had been caused by the sting of a gnat.

PORTEUS, Beilby, an eminent dignitary of the Church of England, was born at York in 1731, and was educated for holy orders at Christ's College, Cambridge. A Seatonian prize poem *On Death*, which appeared in 1759, gave him the start on the road to eminence. Attracting the notice of Dr Secker, Archbishop of Canterbury, he was presented to several benefices. The conscientious manner in which he discharged his ministerial duties, and the impressive and eloquent style in which he preached, soon secured for him the patronage of the queen. His prospects of promotion accordingly became certain. In 1769 he was appointed chaplain to George III.; in 1776 he was raised to the see of Chester; and in 1787 he was transferred to the see of London. Occupying this high position, Bishop Porteous used all his power and influence to promote the interests of religion. He established a fund for the relief of the poorer clergy of his diocese. He founded three prizes in Christ's College, Cambridge, as an incitement to the study of Christianity, both theoretical and practical. He also at his death, in 1808, bequeathed his library for the use of his successors in the metropolitan see. The collected works of Bishop Porteous, containing sermons, pamphlets, a *Life of Archbishop Secker*, and a *Summary of Christian Evidences*, and accompanied with a memoir of the author by the Rev. R. Hodgson, were published in 6 vols. 8vo, London, 1816.

PORT-GLASGOW, a parliamentary and municipal burgh, and a sea-port town of Scotland, in the county of Renfrew, on the south bank of the Firth of Clyde, about 15 miles below Glasgow and 3 above Greenock. This place originally formed part of the adjoining parish of Kilmalcolm, and consisted of the small village of Newark, so called from the barony of that name, which lay in its immediate vicinity. On a point of land projecting into the river, a little above the town, stands the ancient and now deserted castle of this barony. The ground on which the town stands was, in 1668, purchased from Sir Patrick Maxwell of Newark by the magistrates of Glasgow, with a view to provide a convenient harbour for the vessels belonging to the merchants of that city. In 1695 the place was detached from the parish of Kilmalcolm, and, with a few adjacent farms, erected into a distinct parish. It was called New Port-Glasgow, or more commonly Port-Glasgow, a name simply expressing the design of its erection as the port or harbour of Glasgow. In 1775 it was created a burgh of barony; and by the Reform Act of 1832 it became a parliamentary burgh, uniting with Kilmarnock, Rutherglen, Dumbarton, and Renfrew, in returning a member.

The town is romantically situated at the foot of a hill, which, covered with wood and verdure, exhibits a beautiful object to travellers passing along the river. It is one of the most handsome and regularly-built seaport-towns of Scotland. The streets are straight, and for the most part cross each other at right angles; whilst the houses, pretty nearly equal in size, and generally white-washed, give to the whole a light and uniform appearance. The only buildings worthy of particular notice are the town-house and the parish church. Of these, the former is of plain but substantial workmanship, ornamented in front with a portico, resting on four massy fluted columns, surmounted with a handsome spire, which rises from the centre. The parish church, built in 1823, is square in form, and plain but handsome in appearance. A commodious chapel of ease was built in 1774. The other places of worship in the parish belong to the Free and the United Presbyterian churches. Port-Glasgow has also an endowed school, two parish schools, a public library, and two reading-rooms.

Attached to this port are two capacious harbours, substantially built, and completely sheltered. The first dry or graving-dock in Scotland was constructed here in 1762, and has since been improved at great expense. More recently a wet-dock has been constructed in the bay of Newark, which admits vessels drawing 25 feet of water. It is provided with spacious quays and commodious sheds, cranes, and other conveniences; and possesses extraordinary facilities for ingress and egress, owing to the great depth of water in the roads and entrance. With all these advantages, Port-Glasgow now affords shipping accommodation of a very superior description. The trade of the place was at one time chiefly carried on in ships belonging to Glasgow merchants; but the inhabitants have of late themselves become shipowners.

The foreign trade is chiefly with the West Indies and North America. It is the principal place on the Clyde for the importation of North American timber, for the reception of which it has large wood-ponds. The number of sailing-vessels registered at Port-Glasgow, 31st December 1857, was 54, tonnage 5706: of steam-vessels 8, tonnage 1192. In 1857 there entered the port 124 sailing-vessels, tonnage 51,324; and there cleared 44 sailing-vessels, tonnage 29,410; and 10 steam-vessels, tonnage 3695. The improvements in the navigation of the Clyde, and the rise of Greenock, have proved injurious to the prosperity of Port-Glasgow. Its coasting trade was at one time very considerable; but owing to the facility with which vessels of small burden now find their way up the river, nearly the whole of this branch has been transferred to Glasgow. The work of ship-building is carried on here to a considerable extent. Of late years a great number of iron steamboats have been produced, some of them of the largest size. The manufacture of ropes and sail-cloth has been prosecuted for about a century. A considerable business is carried on in sugar-refining. Pop. in 1831, 5192; in 1841, 6973; and in 1851, 6986.

PORTICI, a town of Naples, in the province of Naples, on the shore of the Bay of Naples, 4 miles S.E. of the capital, with which it is connected by railway. It contains a royal palace, which was formerly used as a museum for the antiquities of Herculaneum and Pompeii. These, however, have been removed to Naples; and the palace has thus lost its chief attraction. It still possesses, however, some good pictures by modern French artists. Portici is a favourite resort during the autumn of the higher classes of Neapolitans. It has a harbour protected by a mole, a church, convent, barracks, and ribbon manufactory. Fishery and the coasting trade are actively carried on here. Pop. 6200.

PORTICO. See *Glossary* to ARCHITECTURE.

PORT-JACKSON, an inlet of New South Wales, in the county of Cumberland, has an entrance about 2 miles wide, between steep cliffs, called the North and South Heads; S. Lat. (of the South Head, on which is a lighthouse, 345 feet above the sea) 33. 51., E. Long. 151. 18. It is 15 miles in length, and has several arms and creeks stretching into the land. The anchorage is everywhere good and well sheltered. On the south shore, about 6 miles from the entrance, stands Sydney.

PORTLAND, ISLE OF, a peninsula and parish of England, in the county of Dorset, is joined to the land by Chesil Bank, which is a narrow ridge of clay covered with shingles, about 10 miles in length. The isle itself is about 4 miles in length by 2 in breadth; and it terminates in a rocky promontory called the Bill of Portland, on which stand two lighthouses,—the one 130, and the other 197 feet above the sea, N. Lat. 50. 3., W. Long. 2. 26. It consists of oolitic limestone, and slopes gradually from a height of 490 feet to within 30 feet of the sea. Portland Isle is approached from the land by a wooden bridge 600 feet long. It contains the castle of Portland, built by Henry VIII. in 1520; the Bow and Arrow Castle, a rudely-built tower, said to have been erected by William Rufus; a convict prison, erected in 1849; and several small villages. There are also here extensive quarries of Portland stone, with which many of the public edifices in the kingdom have been built. A harbour of refuge is in process of being constructed at Portland by means of a breakwater from the north end of the isle, partly inclosing Portland road. It is intended to be 2500 yards long, and to extend to a distance of 1¾ miles from Weymouth pier, thus sheltering from the S.E. an area of 2107 acres at low-water; while Chesil Bank forms a natural breakwater on the S.W. The work was begun August 11, 1847, and up to March 31, 1857, it had been extended to a length of 5145 feet by the deposition of 2,667,905 tons of Portland stone. The sum expended, from the beginning of the works up to March 31, 1857, was L.627,585. Pop. of the parish of Portland (1851), 5195.

PORTLAND, a seaport-town of the United States of North America, in the state of Maine, stands on the W. shore of Casco Bay, 60 miles S.S.W. of Augusta, and 105 N.E. of Boston, N. Lat. 43. 4., W. Long. 70. 46. It is built on what was originally an island, but is now connected with the continent by a neck of land only a few yards wide. It is about 3 miles in length from E. to W., and terminates at the E. in Munjoy, and at the W. in Bramhall's Hill, the former 156 and the latter 171 feet above the sea. Between these two eminences there is an elevated ridge, along which runs the principal street of the town. A broad street lined with wharves extends along the edge of the water for about 2 miles, and is intended to be continued round the whole peninsula. The houses of Portland, which are for the most part of brick, are regularly built, and many of the streets are very elegant. The beauty of the town is also much enhanced by the many shady trees which grow in different parts of it. Of these there are, it is calculated, no fewer than 3000 in all. One of the most conspicuous edifices is the custom-house, which is three storeys high, surmounted by a dome 75 feet above the ground, and adorned in front with a portico of eight fine columns. The city-hall and court-house are both handsome buildings. There are in all 26 churches in Portland belonging to various sects, and most of them built of wood. The number of schools in the town and neighbourhood is 25, with 57 teachers and an average attendance of 3600 pupils; and the sum devoted to the purposes of education in 1852-3 was L.4272. Portland has several scientific and literary associations, the chief of which are the Society of Natural History, numbering about 275 members, and possessing an excellent museum; and the Athenæum, which has a library of 8000 volumes. The town contains 6 banks and 11 newspaper offices. The manufactories of Portland comprehend a large sugar establishment, covering 1½ acres of ground, and employing about 200 hands; the Portland Company, for the manufacture of locomotive steam-engines, railway carriages, and all kinds of machinery. The latter was established in 1847, employed in 1854 about 325 hands, and had built up to that date 90 railway locomotives, besides steam-boat engines and other pieces of machinery. Ship-building is another branch of industry extensively carried on at Portland. The number of vessels built in the district during the year 1854 was 40, tonnage 30,195. The total shipping of the port, June 30, 1852, was 77,575 tons registered, and 28,403 tons enrolled and licensed. In that year there entered the port from foreign countries 384 vessels, tonnage 57,610; and there cleared for foreign countries 443 vessels, tonnage 69,893. The commerce of Portland is extensive and rapidly increasing. The total value of the exports in 1854 was L.627,985; and of the imports, L.650,970. The harbour of Portland is very good. It is easy of access, not being obstructed by any bar, and it is safe and well sheltered. Vessels of the largest size can enter or leave the harbour at all states of the tide; and there are numerous wharves and piers accessible for vessels drawing from 18 to 28 feet. Portland is connected by railway with Boston, and the other great cities of the United States on the one hand, and with Quebec, Montreal, and Toronto on the other. It has therefore a very advantageous position for commercial purposes; and to this position it owes not a little of its advancement and prosperity. The total amount of real and personal estate at Portland in 1857 was valued at L.4,661,180. Pop. (1850) 20,819; (1855) 27,090.

PORTLAND VASE, a celebrated funeral vase, long in possession of the Barberina family, but which was purchased by Sir William Hamilton, and afterwards passed to the Duchess of Portland for 1000 guineas. Its height is about 10 inches, and its diameter where broadest 6. There are upon it a variety of figures of most exquisite workmanship, in bas-relief, of white opaque glass raised on a ground of deep blue glass, which appears black except when held against the light. It seems to have been the work of many years, and there are antiquaries who date its production several centuries before the Christian era; since sculpture was declining in excellence even in the time of Alexander the Great. It was deposited in the British Museum in 1810 by the Duke of Portland.

PORT LOUIS, the capital of the island of Mauritius, on a small bay formed by basaltic and partially-wooded hills near the N.W. extremity of the island; S. Lat. 20. 10., E. Long. 57. 29. The streets are regular, though narrow, and some of them are planted with beautiful acacias. The houses are low, and built for the most part of wood. Behind the town lies an open space called the Champ de Mars, which is lined with many elegant villas. The chief buildings are the large and convenient barracks, hospital, bazaar, theatre, public library (containing more than 60,000 volumes), court-house, college, and botanic garden. The harbour is good and well sheltered, but it is difficult of access, on account of a coral reef at its mouth. During the season of hurricanes the anchorage is not safe, except for a small number of vessels. Port Louis is a convenient port for repairing vessels, and has docks for that purpose. The harbour and town are defended by fortifications of some strength. Pop. 35,000.

PORT MAHON. See MINORCA.

PORTO ALEGRE, a town of Brazil, in the province of Sao Pedro do Rio Grande do Sul, stands on the Jacuhy, near its mouth in Lake Patos, 150 miles N.N.W. of Rio Grande. It is regularly and well built, and contains several churches, a custom-house, hospital, lyceum and other schools. The harbour is much frequented by merchantmen, and an active trade is carried on. Pop., with the suburbs, 12,000.

PORTOBELLO, a parliamentary and municipal burgh of Scotland, and a suburb of Edinburgh, in the county of Mid-Lothian, on the S. shore of the Frith of Forth, 3 miles E. of Edinburgh. The older streets are narrow, but there are many elegant streets of recent erection. There are here places of worship belonging to the Established Church, the Free Church, the United Presbyterians, Episcopalians, Independents, and Roman Catholics. Portobello is much resorted to during the summer for bathing. The beach is sandy and gently sloping; and the town contains hot and cold baths. Many of the inhabitants are employed in the manufacture of bricks and tiles, pottery, flint-glass, and paper; and there are salt-works at the village of Joppa, which is within the limits of the burgh. The burgh is governed by a provost and nine councillors; and it unites with Leith and Musselburgh in returning a member to Parliament. Pop. (1851) 3497.

PORTO FELIX, a town of Brazil, in the province of Sao Paulo, on the left bank of the Tiete, 50 miles W. of Sao Paulo. It stands in a beautiful, rich, and salubrious country, which produces sugar in large quantities, and feeds numerous herds of cattle. Pop. of the district, 10,000.

PORTO FERRAJO, a town of Tuscany, capital of the island of Elba, occupies a promontory on the N. coast of the island. It is fortified and defended by two forts on the hill above. There are in the town, which is well built, two parish churches, courts of law, a theatre, hospital, barracks, &c. Iron is exported from the mines in the vicinity; and there is an excellent harbour. Napoleon I. resided at Porto Ferrajo from May 1814 till February 1815. Pop. 4436.

PORTO MAURIZIO, a town of the kingdom of Sardinia, in the division of Nice, on the shore of the Gulf of Genoa, 40 miles E.N.E. of Nice. It stands on a hill projecting into the sea, and separating the bays of Oneglia and St Stefano. The bold and lofty position of the town, with its brilliantly-painted church in the centre; the quiet little port below, crowded with picturesquely-rigged boats; and the mountains which rise in the distance, combine to produce a very beautiful and characteristic picture. The town contains a convent, hospital, theatre, and schools. A trade in oil of good quality is busily carried on here; but the harbour is shallow, and inconvenient. Pop. 6481.

PORTO NOVO, a seaport of British India, in the district of South Arcot, presidency of Madras, at the mouth of the river Vellaur, 116 miles S. of Madras. It was at one time a place of much importance, but it suffered very severely in the wars of the British government against Mysore, and fell into a state of decay. It is now, however, in a more prosperous condition, chiefly on account of the extensive iron-works, which have been established here. The ore is obtained in abundance in the vicinity, and may be made into the finest steel. At Porto Novo, Hyder Ali, with an immensely superior army, was totally defeated by the British under Sir Eyre Coote in 1791.

PORTO RICO, a Spanish possession, one of that group of West India Islands called the Great Antilles, and the smallest of the four in population and extent, but yielding to none in fertility and general importance. It lies between N. Lat. 17. 56. and 18. 20., W. Long. 65. 40. and 67. 20., to the E. of Hayti, Cuba, and Jamaica, being separated on the W. from the first-named island by the Mona Channel, 75 miles in breadth, and having the Atlantic Ocean on the N., with the Caribbean Sea on the S. It is about 100 miles in length from E. to W., by 40 miles in average breadth, and contains an area of 3700 square miles. A chain of lofty mountains intersects it from E. to W.; the highest part, called Lugnilla, at the N.E. extremity of the island, being 3678 feet in height. Valleys, levels of table-land, and gentle declivities, all highly fruitful, are everywhere found embosomed in these mountains, which are themselves susceptible of cultivation to the very tops. To the N. and S. of this interior ridge, between it and the coast, are those richly fertile valleys which produce the chief wealth of the island. They are formed by smaller ridges of hills, which run N. and S. from the principal chain, and they are much more level than the valleys among the loftier mountains. The valleys of the N. and E. coasts are the richest and the most picturesque, the pasturage there being always verdant and luxuriant, from the abundant supply of rain which they receive; whilst those of the S. coast, though more productive of sugar, are often parched by excessive drought. Few countries of the same extent as Porto Rico are watered by so many streams. Seventeen rivers, taking their rise in the mountains, cross the valleys of the N. coast and fall into the sea. Some of them are broad and deep, and navigable for 5 or 6 miles from their mouths, which, however, are much obstructed by bars. These rivers are well stocked with excellent fish, and their banks are nearly all under cultivation. The south, west, and east coasts are well supplied with water, notwithstanding the unfrequency of rain, by several large streams, besides numberless rivulets. The coasts of the island are indented with numerous bays and creeks; and in some places there are lagoons extending to the length of 8 or 10 miles. The climate of Porto Rico is tropical; but it is healthy, and more favourable to Europeans than that of the adjacent islands. There are two rainy seasons here, the first occurring in May and the second in September. In August the atmosphere is oppressively hot, the thermometer being frequently above 90° of Fahrenheit; and during the coldest season it is never below 70° at noon. In September the rains descend like a deluge, and the rivers swell and overflow their banks, completely inundating the low lands. In October the weather becomes cooler, and in the following month the N. and N.E. winds generally set in, diffusing an agreeable coolness through the atmosphere. When the fury of the north wind abates, the most delightful weather is experienced. Hurricanes, the scourge of the West Indies, sometimes visit this island, generally between the months of July and October. The warmth and moisture of the climate foster a luxuriant vegetation. Ebony, cedar, lignum vitæ, mahogany, logwood, and other kinds of timber, grow in the forests; indigo, and many other valuable and medicinal plants, are also found in the island. Porto Rico exhibits a singular scarcity of indigenous animals. There are no venomous snakes or reptiles, no beasts of prey or indigenous quadrupeds of any kind to be found in the forests, scarcely any birds except parrots and water-fowl, and no noxious insects. But rats of an enormous size infest the country in great numbers, and sometimes commit dreadful ravages upon the sugar-canes.

The most valuable mineral productions of Porto Rico are copper, iron, lead, and coal. Gold is obtained from the streams; and there are two productive salt ponds. The principal employment carried on in the island is agriculture, as there are hardly any manufactures, and the mining operations, only recently commenced, attract little attention. Only about one-twelfth of the soil is under cultivation. Coffee, sugar, and tobacco are the crops principally raised; and there are also extensive farms for the rearing of live stock. The commerce of the island is very great. It is chiefly carried on with Spain and the United States; but also to a large extent with the other West Indian islands, with Great Britain and the British colonies. The quantity and value of the chief articles exported from the island in the years 1850 and 1855 were as follows:—

Articles.	1850.		1855.	
	Quantity.	Value.	Quantity.	Value.
Sugar (cwt.)	876,011	L.814.611	792,484	L.633,983
Coffee „	92,060	147,295	106,580	170,526
Cotton „	1,887	7,865	1,855	4,656
Hides „	4,256	10,212	6,271	15,050
Tobacco „	23,228	24,775	19,349	20,650

The total value of the exports was, in 1850, L.1,175,464, and in 1855, L.994,343. For the same years the quantity and value of the principal imports to Porto Rico were as follows:—

Articles.	1850.		1855.	
	Quantity.	Value.	Quantity.	Value.
Wheat flour (brls.)...	50,493	L.131,490	57,864	L.150,606
Cod-fish (cwt.)........	79,755	76,794	91,697	73,554
Cotton fabrics.........	...	135,644	...	183,408
Linen fabrics	...	64,608	...	69,499
Metals	...	159,375	...	60,493

The total value of the imports was, in 1850, L.1,044,406, and in 1855, L.1,157,178. In 1850 there entered the various ports of the island 1206 vessels, tonnage 132,041; and there cleared 1179, tonnage 131,767. In 1855 there entered 1317, tonnage 167,203; and cleared 1276, tonnage 163,477. The dues collected at the custom-houses of the island amounted in 1855 to L.24,674, being an increase of L.9445 over the preceding year. The principal seaports of the island are San Juan de Porto Rico (the capital), Mayagües, Ponce, Guayama, and Arecibo. The government and laws of the island resemble those of the other Spanish possessions in America. The supreme power in military affairs is in the hands of the lieutenant-general, who is also president of the Audiencia Real, the highest court in the island. The military force of Porto Rico consists of a regiment of infantry, a brigade of artillery, and a body of cavalry, besides a militia comprehending seven battalions of infantry and a regiment of cavalry. The religion of the island is Roman Catholic, and it forms the see of a bishop, who resides at the capital. The public revenue in 1854 amounted to L.364,906, and the expenditure to L.356,706.

Porto Rico contains fifty-eight towns and villages. The largest place is San Juan de Porto Rico, the capital. It is finely situated on a small island on the north coast, which is connected with the mainland by a bridge. The streets are straight and regular, and the town is inclosed on every part by strong fortifications, which render it almost impregnable. It is considered one of the best and healthiest towns in the West Indies. Among the public edifices may be mentioned the cathedral, a large mass of building, which has never been finished; four churches, two chapels, three convents, an episcopal palace, and a seminary for the education of the clergy; the royal military hospital, a large stone edifice, and an establishment of the same kind for females; the jail, a house of correction, a large and handsome town-house, a beautiful theatre, a custom-house, an arsenal, and some others. The town has also several public schools, and a society for the promotion of the fine arts. There is an excellent and secure harbour, and a commodious wharf. This town was founded in the year 1514. Within a century afterwards it was twice taken and plundered by the English, who, however, could gain no permanent footing on the island, neither at these times nor at a later period under General Abercromby. The population is estimated at 30,000.

Porto Rico was discovered by Christopher Columbus in 1493, and was supposed at the time to contain 600,000 inhabitants. It was invaded in 1509 by Spaniards from Hayti, and the natives were soon exterminated by them. Towards the end of the seventeenth century the island was captured by the British; but it had to be abandoned soon after on account of the mortality among the troops. In 1820 a revolution was made in Porto Rico, with a view to a separation from the mother-country; but this movement was finally put down in 1823. The island is divided into seven departments, as follows:—

	Pop. (1846).
La Capital	70,861
Arecibo ......,......	54,044
Aguadilla	57,322
Mayagües .....,......	99,895
Pouce	71,168
Humacao	41,593
Guayama	51,756
Total........	446,639

In 1855 the total population amounted to 500,000. More than half of the people are of Spanish descent; the remainder is nearly equally divided between Mulattoes and Negroes, and of the latter about two-thirds are slaves. It has been remarked that in Porto Rico there is none of that antipathy between the black and white races that exists in the United States and other countries.

PORTO SANTO. See Madeiras.

PORT OF SPAIN, or Puerto d'Espana, a town of the West Indies, capital of the island of Trinidad, on its N.W. shore, near the mouth of the Carony, in the Gulf of Paria. It is one of the finest towns in the West Indies, being well built of stone and brick, and having broad and regular streets, some of them adorned with rows of trees. It contains a government-house, court-house, a good market-house, churches belonging to the Episcopalians, Presbyterians, Methodists, and Roman Catholics, several schools, a lunatic asylum, hospital, and jail. In the vicinity of the town are botanic gardens and St James's barracks, which are built in one of the most unhealthy spots in Trinidad. Port of Spain has a large and good harbour, where an active trade is carried on. Pop. 11,693.

PORTPATRICK, a seaport-town and parish of Scotland, in the county of Wigton, built partly on the slope of a hill on the shore of the Irish Channel, 6½ miles S.S.W. of Stranraer, and 109 S.W. of Edinburgh. The principal street extends in a curve along the shore of the bay, and some smaller streets branch off from it. The houses are for the most part well built and slated. There are here an Established church, a Free church, several schools, and a public library. Many of the inhabitants are engaged in cod-fishing. The new harbour, which was constructed by the Admiralty at great expense, is neither safe nor easy of access. Portpatrick has declined very much since the mail packets ceased to ply between this and Donaghadee in Ireland. A submarine telegraph has been laid between these two places. Pop. (1851) 1038.

PORT PHILIP, a large bay of Australia, in the colony of Victoria, about 35 miles in length and as much in breadth, with an entrance not quite 2 miles wide; S. Lat. (of Point Nepean at the entrance) 38. 18., E. Long. 144. 42. On its west side is an inlet, at the head of which the town of Geelong stands; and at its northern extremity the Yarra-Yarra flows into Port Philip, having Melbourne on its banks about 8 miles up. (See MELBOURNE.)

PORTREE, a village and parish of Scotland, in the county of Inverness, at the head of a small loch of the same name, in the Isle of Skye. It contains an Established church, a Free church, and a parish school. The natural harbour is well sheltered on all sides, and is capable of containing a large number of vessels. Steamers ply regularly between Portree, the other towns on the west coast of Scotland, and Glasgow. Cattle, salmon, and other articles are exported from Portree. Pop. of the parish, 3557.

PORT REPUBLICAIN, or PORT-AU-PRINCE, the capital of the empire of Hayti, and the chief seaport in that island, stands at the head of the bay of Gonaives, on the W. coast, N. Lat. 18. 35., W. Long. 72. 18. It is partially fortified towards the land, and there is a battery on a small island that protects the harbour. It has a commanding appearance from the sea; but though the streets are broad and regular, the most of the houses are built of wood, low, and mean in appearance. The chief buildings are,—the palace, court-house, church, arsenal, mint, school, and military hospital; but few of these are of any architectural merit. The surrounding country is swampy and unhealthy. Port Republicain carries on some commerce with Jamaica and the United States. The number of ships that entered the port in 1855 was 182, tonnage 30,530; those that cleared 158, tonnage 26,079: besides the coasting trade, in which were employed 38 ships, tonnage 7241. The harbour is quite safe, except during the hurricanes which occur between August and November. Port Republicain was founded in 1749. It was nearly destroyed by an earthquake in 1770, and has been much injured on various occasions by fire. Pop. 25,000.

PORT ROYAL, a fortified town of Jamaica, once the capital of that island, at the end of a narrow strip of land forming the S. side of Kingston harbour, N. Lat. 17. 56., W. Long. 76. 51. It was once a flourishing and well-built town, but it has suffered once and again from earthquakes and fires, and its public offices have been removed to Kingston. It still contains a naval arsenal, barracks, hospital, and other buildings, and its harbour is a station for British men-of-war. The town is chiefly inhabited by Negroes. Pop. 15,000.

PORT ROYAL, a name celebrated in history, and under which is designated two nunneries, the one situated near Chevreuse, about 5 leagues from Paris; the other in Paris, in the Faubourg St Jacques. Hence the two-fold designation of *Port Royal de Paris* and of *Port Royal des Champs.* The latter is the more ancient title, dating back as far as the time of Philippe-Auguste, who having lost his way while hunting, found in this sequestered valley a shelter or "port" for himself and his attendants. The monastery was founded in 1204 by Mathilde de Garlande, wife of Matthieu de Marli of the family of Montmorency, when he was on the eve of setting out for the Holy Land. The nuns were of the order of St Bernard de Citeaux, and had their own abbess. Pope Honorius III., in 1223, conferred upon it the privilege of affording an asylum to seculars without binding themselves by permanent vows. The abbey became rich, and the rules of St Bernard were forgotten. It was reserved for Marie Jaqueline Angelique Arnauld, sister to the famous Antoine Arnauld, to introduce into this institution a thorough spirit of reform. She was chosen abbess, through family interest, at the premature age of eleven years; and she had hardly attained to the age of seventeen, in 1608, when she began her work of reform. She resolved at once to shut out the world, and this she gradually effected. In less than five years her sister Agnès, who had been educated at St Cyr, joined the young abbess, and found the reform all but complete. The older nuns gave an example of sincere submission, and the younger were willing to learn. The "Mère Angelique" was removed at this juncture to introduce her discipline at Maubuisson, where the notorious Madame d'Etrés had hitherto ruled. She remained there five years; and on her return to Port Royal des Champs, thirty nuns of Maubuisson besought her to allow them to accompany her. A great many ladies from all parts of France were eager for admittance; and such a rapid increase—where an abbey originally designed for twelve nuns was now inhabited by eighty—began to be a serious inconvenience. The monastery was situated in a deep and thickly-wooded valley, watered by two extensive lakes, which from improper drainage had spread in one continued marsh over the vale. The house at length became a complete infirmary. Madame Arnauld, mother to "Mère Angelique," purchased at a very considerable cost a house known as the Hotel Clagny, situated in the Fauxbourg St Jacques, Paris, and presented it to her daughter. She removed her nuns to this house in 1625, calling it *Port Royal de Paris,* while the original *Port Royal des Champs* was deserted by all save a chaplain, who supplied the parish church. In 1630 M. Angelique obtained a royal grant declaring that the abbess should be elected triennially by the nuns, upon which she and her sister M. Agnès resigned their offices. Six of M. Angelique's sisters were nuns at Port Royal, and her three brothers filled distinguished posts in connection with the state.

The house which they had left, Port Royal des Champs, now became occupied by a number of pious and learned men, who wished to live a secluded life according to the spirit of the papal bull of 1223, and who went by the name of "Les Solitaires de Port Royal." The most distinguished among these recluses were Claude Lancelot, the grammarian; Antoine le Maistre, nephew of the Mère Angelique, who at the early age of twenty-nine, had abandoned the profession of advocate which he had already begun in so distinguished a manner. Antoine was soon followed by his two brothers, Séricourt a distinguished officer, and De Sacy, the eminent translator of the Bible. Add to these the names of the two Arnaulds, Pièrre Nicole, Blaise Pascal, and Nicolas Fontaine. The greater number of these were disciples of Du Verger d'Hauranne, abbé de Saint Cyran, celebrated for his connection with Jansenius, who had been his schoolfellow at Louvain, and celebrated no less for his controversies with the Jesuits. The animosity towards the Jesuits, it may be safely assumed, was not a whit diminished in this "solitary" company. These men established a school, which was to consist of five classes of five pupils each; organized with the design of counteracting the lax morality which tainted the education of the Jesuits. The teachers were chiefly Lancelot, Arnauld, De Sacy, Nicole, and Fontaine; known all the world over by the excellent school-books which were published for the use of that institution. There were a *Nouvelle Méthode pour appendre la Langue Latin; Nouvelle Méthode pour appendre la Langue Grecque; Jardin des Racines Grecques; Grammaire Générale; Elémens de Géométrie; La Logique, ou l'Art de Penser,* written conjointly by Lancelot, Arnauld, Nicole, and De Sacy. Among

Port Royal

the pupils who received their education here were Tillemont and Jean Racine.

Meanwhile the nuns of Port Royal exceeded 180. It became necessary once more to divide them, and Port Royal des Champs was fixed upon as their new abode. The recluses having removed to a farm-house called *Les Granges*, which was situated on the top of a neighbouring hill, the monastery was left vacant for the occupation of the nuns, who after a twenty-five years' absence, were received back to their old abode with the greatest joy by the entire neighbourhood. The Mère Angelique, their superior by election, led them to their new residence, and inaugurated their proceedings among the happy peasantry. The double fame acquired by the *solitaires* and by the *religieuses* secretly aroused the envy and hatred of the Society of Jesus, who harboured already an old grudge against the family of Arnauld. In 1594 Antoine Arnauld, the father of Angelique, gained a lawsuit in behalf of the university of Paris against the Jesuits; and this success had become, what it was afterwards phrased, "the original sin of the Arnaulds." Besides, the adversaries of Port Royal witnessed with pain the education of the most distinguished youth of the kingdom pass out of their hands. On the 1st July 1649, Nicolas Cornet led on before the faculty of theology the famous quarrel of the "five propositions" upon grace, contained in the book of Jansenius. Antoine Arnauld, in defence of Port Royal, condemned the five propositions on the ground of their having no existence in the pages of Augustinus. Arnauld was accused of Jansenism; and the nuns of Port Royal, with their abbess at their head, had the courage to declare that they could not see the five alleged heretical propositions in the work of Jansenius. Orders for their dispersion were on the point of being issued, when a miracle occurred to the niece of Pascal which arrested the hand of the executioner, and brought temporary peace to Port Royal. In 1656 a formulary, condemning the five propositions as having a part in the book of Jansenius, was issued by the Archbishop of Toulouse, and imposed upon all religious communities. The Port Royalists refused of course. At last a royal order came in 1660 to disperse them. While this was transpiring, the Mère Marie Jaqueline Angelique Arnauld dispersed in quite a different fashion. She died on the 6th of August 1661, leaving behind her a name not calculated to die. The young ladies continued refractory; and Perefix, Archbishop of Paris, arrested abbess, prioress, and nuns, by a party of police, and distributed them to the care of several monasteries, where they were kept in a state of confinement. In 1669 a compromise occurred between the Pope and the defenders of Jansenius, known as the peace of Clement IX., when the nuns of Port Royal des Champs were restored to their convent. They no longer possessed Port Royal de Paris. This community was severed from the original stock by the order of the king, confirmed by a bull of Clement X. Subsequently disputes arose between the two communities, in which the Jesuits and the Archbishop of Paris played an important part. The upshot of it was, that in March 1708 a bull of Pope Clement XI. shut the convent of Port Royal des Champs, and transferred the property to Port Royal de Paris. D'Argenson, lieutenant of police, was sent from Paris with a body of men to distribute the sisters among several convents, to strip Port Royal des Champs of all its valuables, and level the building with the ground, as a nest of Jansenists and heretics. The bodies of Le Maistre, of Arnauld, of Pascal, of Racine, &c., which lay buried there, were in 1711 exhumed and transported to the cemeteries of Paris. Port Royal de Paris, enriched with the spoils of the House of Champs, continued to subsist without noise or lustre till 1790.

The books that have been written regarding Port Royal are very numerous. The chief are:—*L'Histoire Générale de l'Abbaye de Port Royal*, by Dom Clémencet, 10 vols., Amsterdam, 1755–57; *Mémoires pour servir à l'Histoire de Port Royal*, by Nicolas Fontaine, Utrecht, 3 vols., 1742; *Histoire de l'Abbaye de Port Royal*, by Besonge, 8 vols., 1756; *Mémoires Historique et Chronologique sur l'Abbaye de Port Royal des Champs*, by Guilbert, 9 vols., 1755–58; *L'Histoire de Port Royal*, par Jean Racine, 2 vols., published for the first time in 1767; *Les Ruines de Port Royal*, by Grégoire, 1801; *Geschichte von Port Royal*, by Reuchlin, Hamburg, 1839; *Port Royal* by Saint-Beuve, 3 vols. 8vo, Paris, 1842–43; *Select Memoirs of Port Royal*, by M. A. Schimmelpenninck, 2 vols., 1835, and 3 vols., 1858.

Portsmouth

PORTSMOUTH, the strongest fortified town in England, is situated in the southern part of the county of Southampton or Hampshire, within the hundred of Portsdown, 74 miles from London by road, and 94½ by railway. It stands on an island separated from the mainland by a small creek or arm of the sea. This island, called Portsea, is 3 miles long, and 2½ miles broad, and contains 5568 acres of land of great fertility. It includes, besides the borough of Portsmouth, the town formerly known as Portsmouth Common, but now by the name of the Island, and also the suburbs called Southsea, Landport, and Kingston. Southsea, which takes its name from the castle, built during the time of Henry VIII., is of very recent origin; it owes its prosperity to its beautiful position, and has within the past few years become an important watering-place, and the beach has been pronounced by competent authorities one of the finest in England. A number of mansions and terraces have also been built, and the grounds laid out in a very tasteful manner; so that the place is eminently suited to the wants of a superior class of visitors. A beautiful esplanade extends along the beach from the castle to the king's rooms, a distance of about a mile; and adjoining the rooms are a number of warm, shower, vapour, and other baths: there are also a quantity of bathing-machines ranged along the beach. Near the entrance to the king's rooms are statues of Wellington and Nelson, which were erected at the expense of Major-General Lord Frederick Fitzclarence, late governor of Portsmouth. Landport is peopled for the most part by the dockyard artizans, although it contains a few respectable houses; in it are situated the termini of the Brighton and South Coast, and London and South-Western railways; also the Royal Portsmouth and Gosport Hospital, which is a noble building erected in 1849.

The soil of the island is marshy, and was formerly found to be unhealthy, and the inhabitants suffered much from the scarcity and dearness of good water. But of late years these evils have been remedied by complete drainage, and by the construction of good sewers, which carry the impurities of the town into the sea. Two efficient water companies have been in operation some years; and Portsmouth is now second to no town as far as regards the supply of this indispensable article. Sixty years ago the average number of deaths per annum was above 3 per cent. of the whole population; thirty years since the average was about 2 per cent.; and this is now considerably reduced.

The favourable situation of Portsmouth for a naval arsenal led to the construction of the works that have since distinguished it, at the period when the sovereigns of England first began to form a naval force.

The earliest notice respecting Portsmouth occurs in the *Saxon Chronicle*, in 501, when it is called *Portesmuthe.*

Robert, Duke of Normandy, landed here with a strong army in 1101, during the contest for the throne between himself and his brother Henry I., when the interference of the barons induced him to concur in terms of conciliation. In 1123 it is recorded that Henry I. paid a visit to this place, and passed the season of Whitsuntide. In 1140 the Empress Maud, with her brother the Earl of Gloucester, landed here, and marched from hence to Arundel. In 1193 a charter was granted to the town by Richard I., which conferred upon it various privileges which were at that time enjoyed by the city of Winchester, and which enacted that there should be an annual fair of fifteen days' duration; also a weekly market. The army of Henry III., which was raised for the invasion of France, was mustered here in 1229, and also disbanded. In 1298 King Edward I. granted the inhabitants a charter, conferring on them the privilege of returning members to Parliament. A few years later, during the reign of Richard II., the town was sacked and destroyed by the French. Under Edward IV., Richard III., and Henries VII. and VIII., the fortifications, which at that time were considerable, were greatly extended and improved. In 1545 a French fleet attempted to surprise the town, but to no purpose. Queen Elizabeth added considerably to the defences, in which work she has been followed by nearly every successive sovereign. In the reign of Charles I. the Duke of Buckingham was assassinated by Felton; and in 1756 Admiral Byng was shot on board the Monarque by order of a court-martial. In 1815 Sir E. Cockburn sailed from this town with Napoleon for St Helena.

As the town of Portsmouth is surrounded with walls, the streets are for the most part narrow; nor can it as a whole be represented as a well-built place. The High Street is of moderate breadth, and has a few good buildings; but a part of it is disfigured and contracted by having the market-house running through the middle of it. Some of the buildings are of ancient date; one especially in the High Street is worthy of observation, as having been the dwelling-house in which the Duke of Buckingham was assassinated in the reign of King Charles. It may be remarked that the best buildings in Portsmouth are the inns and hotels, which are numerous, and proportioned to the great number and various descriptions of occasional residents arriving and departing as passengers to and from all parts of the world. There are five barracks,—viz., the royal artillery barracks in Broad Street; those for the marine artillery near the custom-house; and the Cambridge, the Clarence, and the Colewort barracks, for troops of the line. The walk round the fortifications forms a very agreeable promenade; and the grand parade, situated near the King's Bastion, also furnishes an agreeable walk. At the east end of the grand parade is the garrison chapel, the only remaining portion of an ancient hospital founded in 1238, and called the *Domus Dei*.

At the west end of the platform, on an ancient building, which, before the dissolution of the monasteries, had been the government-house, a lofty semaphore has been erected, from which signals are made to the ships in the harbour and at Spithead. It is also connected with a chain of telegraphs, terminating at the Admiralty Office in London, and by which communications are conveyed; so that a message can be sent, and a reply received, in about two minutes. In a niche in a wall of this ancient building is a bust of King Charles I., with an inscription underneath, stating that "after his travels through France and Spain, and having passed many dangers both by sea and land, he arrived here 5th October 1623." This was on his return from the secret journey he made in search of a bride of the Spanish royal family.

The parish church is a venerable object; it was originally erected in 1220, and dedicated to the then recently canonized St Thomas à Becket. The chancel is the only part left of the original building, and affords a contrast, by its numerous pillars, clustered pilasters, and ribbed, pointed arches in the Saracenic style, with the architecture of the nave, built in plain Tuscan style, the pillars of which support circular arches, and carry the roof. Few places of worship in the kingdom are superior to this church in internal beauty, which is chiefly due to the elegance of the chancel, but is increased by a few painted windows over the altar, of modern date. At the west end of the edifice is the tower, added in 1693, and which rises to the height of 120 feet. Over this, in an octagon latticed erection called the lanthorn, is a fine peal of eight bells. Surmounting the whole, as a weather vane, is a gilt model of a ship, 6 feet long, which has a shifting flag on the mizen-mast that moves with the slightest motion of the air, and indicates from what quarter the wind blows, when the breeze is not sufficiently strong to move the hull of the ship.

The walls of this church are adorned with a great variety of handsome ancient and modern monuments; one of the most remarkable of which is that to the memory of the Duke of Buckingham, whose assassination has already been adverted to. In the parish register is to be seen the registration of the marriage of King Charles II. with the Infanta of Portugal, 22d May 1662. This document, in letters of gold on vellum, is highly illuminated in the style of the old missals, and states the marriage to have been performed by Sheldon, Bishop of London. Some doubts have since been suggested, whether any other ceremony was used except a private marriage by a Catholic priest.

Besides this capacious church, there are open to the inhabitants a district church dedicated to St Mary; the garrison chapel, for the worship of the Established Church; and five places of meeting for several sects of dissenters. In the other towns the places of worship are numerous. At Portsea there are, for the Episcopal worship, the parish church of Kingston, the dockyard chapel, St George's church, St John's church, and Holy Trinity church; besides a Catholic chapel, a Jews' synagogue, a Wesleyan, an Independent, and two other meeting-houses. In Southsea are St Paul's and St Jude's churches, with four Baptist chapels. At Landport, formerly known as the Halfway Houses, are All-Saints', St Mary's, and St James's churches, in addition to six meeting-houses of various sects. Almost all these places of worship have Sunday or day schools attached to them; and there are also schools where reading, writing, and arithmetic are taught on the systems of Bell and Lancaster. A philosophical society, founded in 1818, contains a museum of natural history and curiosities; also a choice library, and a number of members: it has weekly lectures, and a reading-room, which is open daily. The mechanics' institute was established thirty years since: it has a large share of public patronage. There is also a beneficial society in Kent Street, and an association in connection with the Established Church. A well-endowed grammar school in Penny Street was founded in 1732, by Dr Smith, himself a native of Portsmouth, for the instruction of fifty boys, sons of the inhabitants, in classical learning. The town-hall, gaol, theatre, custom-house, and other public buildings of Portsmouth, present little or no attraction.

Few markets are better supplied than those of Portsmouth. A large part of the fertile island of Portsea is laid out in kitchen and fruit gardens. No market produces finer meat: large quantities of poultry, hares, partridges, and eggs, are brought from France; and the extensive water communication gives facility to provide hay, corn, flour, and other such articles at very cheap rates. To this cheapness of provisions, combined with the purity of the air, is in a great measure attributed the extension of Southsea, and the number of excellent residences which have lately been erected in that locality.

The public buildings in Portsea, except those belonging to the government, are by no means distinguished; the streets, however, are regularly built, and well paved and lighted, but the general appearance of the houses, with some few exceptions, is mean and despicable, the great majority of the inhabitants being of the lower classes. In Southsea are the king's rooms, in which the balls, soirees, and other such like entertainments are held; they consist of a magnificent suite of rooms, having a frontage to the street of 80 feet: within is the promenade-room, 45 feet long, 35 feet wide, and 17 feet high; besides a number of other apartments, and hot and cold vapour and shower baths, as has already been stated.

It is, however, as the great depot of the British naval power that Portsmouth is most important; and in this view the state of the surrounding water, and of the harbour above the town, become worthy of observation and description. One of the great advantages accruing to this place is that very fine anchorage known by the name of Spithead. It is nearly midway between the mainland and the Isle of Wight, and is protected by the highlands of the island from southerly winds, and from northerly and easterly winds by the mainland. It has an advantageous entrance; for though at the east there are some dangers on what is called the Princessa Shoal, and on the ranges of rocks called Bembridge Ledge and Betty's Ledge, they, as well as the Nab Rock, the Long Rock, the Warner, and Romansland, are so well provided with either floating lights or distinguishing buoys, that there is little risk, except in very dense fogs, when the buoys cannot be seen, nor the leading marks observed on the sea-shore. At this entrance it is a great advantage that at St Helen's, at the east end of the island, there is a good anchorage; so that if the wind takes a vessel short, she can safely ride till the breeze is in her favour. The western entrance to Spithead is by Hurst Castle, and the rocks called the Needles. This passage is always safe in fair winds, on account of the definite track which is shown by the buoys, lights, and landmarks; but it is so hazardous in contrary winds that very few ships attempt to beat through. The passage out by the Needles is used by more vessels than come into Spithead by that way. The anchoring-ground at Spithead is very good for holding, and very clear, except near the wrecks of the Royal George, the Boyne, and the Edgar, around which the tide has formed considerable banks. There is a regular depth of water at every part, varying from 6 to 12 fathoms, and the space is sufficient for the whole navy of England to ride at single or double anchor, without danger of falling on board each other when swinging with the changes of the tide.

Within the smooth water, between the island and the mainland, there are other very good anchorages: of these the Mother-bank is the principal; Stokes Bay is another safe anchorage. Here is the measured mile in which the speed of every new ship is tried.

The great advantages arising from so secure a rendezvous as Spithead, so near to the great national marine arsenal, are too obvious to need any elaborate remarks. The entrance to the harbour of Portsmouth is narrower than the Thames at London Bridge; yet there is sufficient depth of water for the largest man-of-war to enter at any state of the tide. The defences are of the most impregnable character, the channels by which vessels approach the harbour being crowned with forts and batteries, and armed with artillery of the heaviest calibre; so that an enemy's fleet, however strong, would be utterly annihilated before it could reach even the entrance. The interior of the harbour expands into a spacious lake 4 miles long and 2 miles broad, in which those ships of war that are under repair, or preparing for sea, are riding, and some of them lying at the wharves of the dock, which borders the harbour on the eastern side. From thence the harbour extends into the land, and contains, in one part called Rotton Row, the ships that are in ordinary, being with no other crews than a few warrant officers, to prevent them from plunder, or from injury by weather. The water here branches off in various directions, and by the help of the tide is navigable to Fareham, and to Portchester Castle, a pile of antiquity that will reward the curiosity of a visitor. Respecting the defences which envelope the town, it has been stated that, in case of a siege, these fortifications would require a garrison of no less than 14,000 men, all the works being surrounded by moats, which are very wide and deep, and can be speedily filled with water from the sea.

The dockyard of Portsmouth is one of those noble objects in which every Briton feels an interest. The gunwharf, under the ordnance department, is an immense arsenal, consisting of various ranges of buildings for the reception of military and naval stores and artillery. These storehouses are vast piles, and are fitted to contain all kinds of necessaries for the sudden equipment, both of a fleet and an army. Above 3000 men are constantly employed here, although the various operations are conducted by steam-engines, and every improved facility in machinery is adopted. On the wharf is the grand depot for guns, carronades, and mortars, with shot and shells of almost every size and weight, all of which are arranged in gigantic pyramids. Here also, in times of peace, the guns from the ships in ordinary at the port are lodged, each ship's guns being kept in a separate tier, whilst the carriages are deposited away in the same regular manner in the proper storehouses; so that the whole may be easily collected again, and re-embarked. The small armoury is worthy of notice; it contains 25,000 stands of arms, all placed in the same ornamental style as those of a similar description in the Tower of London. The roof of this building is covered with copper, which, being oxidized by exposure to the atmosphere, when viewed on approaching it from the quay gate, conveys to the mind the idea of a green grassy slope, or a still wave of the sea.

The victualling establishment was removed at the commencement of the present century to the opposite side of the harbour, and is now in the town of Gosport. A communication is kept up between Portsmouth and Gosport by a steam floating bridge, which conveys passengers and merchandise at very low rates. The biscuit-bakery, the bread, pork, beef, rum, wine, and clothing stores, are open to the inspection of visitors. One of the greatest curiosities is the machinery substituted for manual labour in making biscuits, whereby every process, in its minutest details, is effected, preparatory to its being ready for the oven, including kneading, rolling, forming, and stamping. As a proof of the superiority of machinery over the old methods, it may be observed that 5 cwt. of dough may be mixed, completely kneaded, and prepared for the oven in seven minutes.

Portsmouth, independent of its naval dockyard, possesses a considerable foreign and coasting trade. The number of sailing-vessels registered at Portsmouth, 31st December 1857, was 251, tonnage 14,867; of steamers 8, tonnage 221. In the year 1857 there entered the port 1581 sailing-vessels, tonnage 144,596; and 36 steamers, tonnage 13,335: and there cleared 908 sailing-vessels, tonnage 35,414; and 74 steamers, tonnage 30,415. Of those that entered, 134,961 tons were engaged in the coasting, and 22,970 in the foreign and colonial trade; and of those that cleared, 76,805 tons were engaged in the former, and 9844 in the latter. The amount of duty received at the custom-house during 1857 was over L.70,000.

The population of the borough has greatly increased during the present century, as appears from the following returns:—

	1811.	1831.	1851.
Portsmouth	7,103	8,083	10,329
Portsea	34,484	42,306	61,767
Total	41,587	50,389	72,096

By far the greater number of these are the families of officers and men of the navy, army, and marines, and of the various dockyard artificers. The limits of the borough contain within them the whole of the town of Portsea. The corporation now consists of fourteen aldermen and forty-two councillors, who elect the mayor. It is divided into six wards, and has justices of the peace appointed by the Crown. The Reform Act confirmed the ancient privilege of returning two members to Parliament, which the town has uninterruptedly enjoyed from the time of Edward I.; the whole of the suburbs being now included in the limits of the parliamentary borough.

PORTSMOUTH, a seaport-town of the United States of North America, state of New Hampshire, stands on the right bank of the Piscataqua river, about 3 miles above its mouth, 54 miles N. by E. of Boston. It occupies a fine situation on a peninsula in the river, and is connected by bridges with Kittery in Maine, on the opposite side. The streets are irregular and narrow, but some of them have handsome buildings, and are lined with trees. There are in the town an arsenal, two market-houses, eleven churches, many of them handsome buildings, numerous schools, an athenæum, with a museum, and a library of 10,000 volumes, a lunatic asylum, &c. The United States navy-yard, which occupies an island near the eastern bank of the river, is one of the most important and interesting establishments in the town. It contains three large ship houses, and a dry dock 350 feet long by 105 broad, constructed at a great expense. The harbour of Portsmouth, which is defended by two forts, is large, deep, and easy of access; so that in stormy weather many vessels take refuge in it. It is said to be capable of containing as many as 2000 ships. Manufactures are actively and extensively carried on in the town; cotton, hosiery, ropes, shoes, iron-castings, &c., are the chief articles produced. Ship-building is also largely carried on; and the tonnage of the port, June 30, 1852, amounted to 16,654 registered, and 8237 enrolled and licensed. During the year ending at that date there entered from foreign countries 78 ships, tonnage 8493; and there cleared for foreign ports 64, tonnage 7466. In the same year the imports amounted to L.20,750, and the exports to L.13,940; and the duties collected to about L.6250. Pop. (1850) 9739; (1853) about 11,000.

PORTSMOUTH, a seaport-town of the United States of North America, in the state of Virginia, on the left bank of the Elizabeth river, opposite the town of Norfolk, 160 miles S.E. of Richmond. It is well and regularly built on level ground, and it contains a large and showy naval hospital, a court-house, six churches, a literary, scientific, and military academy, and other buildings. In the suburb of Gosport there is a government dry dock capable of admitting the largest vessels. Portsmouth is connected by railway with Charlestown in South Carolina; and steamers ply daily between this and Richmond. The harbour is safe and accessible to the largest ships. Pop. 8626.

PORTSMOUTH, a town of the United States of North America, state of Ohio, on the right bank of the Ohio, at its confluence with the Scioto, 115 miles above Cincinnati, and 90 S. of Columbus. It contains a court-house, a bank, six or eight churches, two large schools with 13 teachers and about 700 pupils, two iron foundries, a forge, and a nail factory. Iron, coal, and good building-stone are obtained in abundance in the vicinity. Pop. (1850) 4011; (1853) about 5000.

PORTUGAL.

THE modern kingdom of Portugal embraces a part of, and somewhat more than, the country called *Lusitania* by the Romans. The etymology of the present name is involved in obscurity; for though many conjectures have been put forward, none seems worthy of confidence.

History.

The history of Portugal commences with a story to this effect:—Affonso VI., King of Leon and Castile, being apprehensive that his success in taking the city of Toledo would bring upon him the whole force of the Moors, sent to demand assistance from Philip I. of France, and the Duke of Burgundy, whose daughter he had married. His request was granted by both princes; and a numerous body of troops was speedily collected for his service, having at their head Raymond, Count of Burgundy, and Henry, younger brother of Hugh, Duke of Burgundy. In the year 1087 they arrived at the court of Dom Affonso, where they were treated with all possible marks of esteem; and having, in the course of two or three years, given great proofs of their courage and conduct, the king resolved to bestow his daughter Urraca, then, at most, in her ninth year, upon Raymond, Count of Burgundy, and assigned them the province of Galicia for the support of their dignity. About the year 1095 Dom Affonso, being desirous to express his gratitude to Henry of Burgundy, gave him in marriage a natural daughter of his, named Theresa; and upon this marriage he conveyed in full property the frontier province he had conquered from the Moors. The new sovereign, with the title of Count, fixed his residence at Guimaraens, a town to the north of the Douro, where the remains of an ancient palace belonging to his successors are still to be seen.

Henry of Burgundy the first count of Portugal.

Henry is said to have performed great exploits against the Moors; but the accounts given of them are extremely indistinct and unsatisfactory. He died in 1112, and was succeeded by his son Dom Affonso, then in the third year of his age. In the minority of the latter the kingdom was governed by the queen-mother, Dona Theresa, assisted by two ministers. During their administration differences took place between the queen-regent and Urraca, Queen of Castile, which were not arranged until the death of the latter.

Differences with Castile.

Affonso's wars with the Moors and the King of Castile.

The greatest misfortune which befell Theresa was a quarrel with her own son, Dom Affonzo Enrique. A civil war ensued, in which the queen's forces were totally defeated, and herself made prisoner, a situation in which she continued during the remainder of her life. Enrique having thus attained to the full possession of his dominions, made several attempts upon various places in Galicia, but without success; and he was at last constrained to conclude a peace with Affonso, King of Castile and Leon, who had assumed the title of *Emperor of the Spains*, more especially as his dominions happened to be at that time invaded by the Moors. The number of infidels was so great, that the Count of Portugal had but little hopes of subduing them; but a plague having broken out in the Moorish army, they were obliged to retreat, after which he reduced several places belonging to that nation. In the meantime, the Emperor Dom Affonso having made an irruption into the Portuguese territories, destroyed everything with fire and sword. The King of Portugal surprised and cut off a considerable part of his army. At the intercession of the Pope's legate, however, a peace was concluded, and all places and prisoners taken on both sides were delivered up.

Victory of Ourique.

Meanwhile, the progress of the Christian arms in Spain being reported to Abu-Ali Texefien, the chief of the Moors in Barbary, he directed Ishmael, his lieutenant in Spain, to assemble all the forces in the southern provinces, and to drive the Christians beyond the Douro. The Moors were met by Dom Affonso on the plains of Ourique, near the Tagus, and were totally defeated. The event was an important one in the history of Portugal. It stimulated the imagination of the people, and circumstances were attached to it, as time rolled on, which the historian is compelled to reject, as no more worthy of credit than the legends of Romulus and Remus. It was said that the Portuguese force consisted of no more than 13,000 men, whilst the Moorish army, commanded by five kings, numbered 200,000. The count, half daunted by the superior strength of the enemy, was encouraged to engage in combat by a hermit, who told him to go forth in the morning when the bell should ring for mass, and turn to the east. He did as he was ordered, and then beheld within a circle of clouds the image of Christ crucified, and this promised him victory, with a crown, and a line of sixteen successors to inherit it. Whatever the literal fact may be, the Portuguese look upon the plains of Ourique as the birthplace of the monarchy.

Dom Affonso assumes the title of King.

After this victory, gained in the year 1139, Dom Affonso was proclaimed king by his soldiers, and ever afterwards retained that title, renouncing all kind of subjection to the crown of Spain. Being very desirous, however, of reducing the power of the emperor, he formed a league with Raymond, Count of Barcelona, and regent of the kingdom of Aragon, against that prince. In virtue of this treaty, he entered Galicia with a considerable force on one side, whilst Don Raymond simultaneously invaded it on the other. But neither of these enterprises succeeded. The Portuguese monarch met with a severe check in his expedition into Galicia, where he received a dangerous wound, whilst some of the nobility who attended him were taken prisoners. At the same time, having received intelligence that the Moors had invaded his dominions, he was obliged to retire; but his retreat was not made in sufficient time to prevent the strong fortress of Leiria from falling into their hands. This fortress they demolished, and put the garrison to the sword; but the king caused it to be re-constructed of greater strength than before, and placed in it a more numerous garrison. Yet he undertook nothing farther during this campaign. The war continued with various success till the year 1145, when the king projected an enterprise against Santarem, a strong city, 40 miles from Lisbon. In this he luckily succeeded, and thus gained a considerable tract of country, with a strong barrier to his dominions.

Reduces Lisbon and other cities.

After this success, Dom Affonso caused himself to be crowned king of Portugal before an assembly of the states, where he also solemnly renounced all dependence upon the crown of Spain; declaring that if any of his successors should condescend to pay tribute or to do homage to that crown, he ought to be deemed unworthy of enjoying the kingdom of Portugal. The next year the king undertook to recover Lisbon from the Moors; but there are so many fables related of this expedition, that it is impossible to come at the truth. All that can be gathered from these accounts is, that he undertook the siege with a small army, and was able to make little progress in it, partly from the strength of the place, and partly also from the numerous garrison by which it was defended. At length, fortunately for Dom Affonso, a fleet of adventurers, French, English, Germans, and Flemings, who were on their way to the Holy Land, having anchored at the mouth of the Tagus, he demanded their assistance, as not altogether foreign to their design of making war upon the infidels. His request was readily granted; and, with their assistance, Lisbon was speedily reduced; a conquest which so much enhanced the reputation of this monarch, and brought such numbers to recruit his army, that before the end of the year 1147 he had reduced twelve other considerable cities.

His regal dignity confirmed by the Pope.

War with Don Ferdinand of Spain.

For many years after this, Dom Affonso was successful in all his undertakings. He settled the internal government of his kingdom; procured a bull from Pope Alexander III. confirming his regal dignity; undertook many successful expeditions against the Moors; and became master of four out of the six provinces which compose the present kingdom of Portugal. He was assisted by the counsels of his queen, Matilda, a woman of great capacity, and able to govern the kingdom in her husband's absence. By her he had a numerous offspring, including three daughters, the eldest of whom, Donna Matilda, was married to the King of Aragon; the second, Urraca, to Don Ferdinand, King of Leon; and the third, Theresa, to Philip, Earl of Flanders. In 1166, however, the king thought proper to invade the dominions of his son-in-law Don Ferdinand, and to seize upon Limmia and Turon, two cities of Galicia, in which he placed strong garrisons. The next year he marched with a numerous army towards Badajoz, which he invested. On receiving the news of this attack, Don Ferdinand, who had assembled a large army at Ciudad Rodrigo, marched to its relief; but he arrived too late, whereupon he resolved to besiege his antagonist in his newly-conquered city. Dom Affonso, perceiving his design, endeavoured to draw out his forces into the field. Though at that time upwards of seventy years of age, he placed himself on horseback, and pushing forward at the head of his horse to get out at the gate, struck his leg against one of the bolts with such violence that the bone was shattered to pieces. This accident occasioned such confusion that the Portuguese troops were easily beaten, and Dom Affonso was taken prisoner. He was, however, kindly treated by his opponent, and a peace was concluded between them. Returning to his dominions before his leg was cured, he became lame for the rest of his life; but this did not abate his military ardour. Towards the end of his reign, an opportunity seemed to present itself of obtaining once for all an entire release from the disagreeable pretensions of the King of Leon, who, it seems, had insisted on the King of Portugal doing homage for his kingdom. This was a quarrel between the King of Leon and his nephew Alonso, King of Castile. The latter solicited assistance from the King of Portugal, which was readily granted. But Ferdinand having received intelligence that the infant Dom Sancho, the king's eldest son, was advancing towards Ciudad Rodrigo, assembled his troops with such diligence on that frontier, that, being enabled to attack him unexpectedly, he entirely defeated him.

Dom Sancho's success against the Moors.

Understanding, however, that Dom Sancho was recruiting his forces with great diligence, he suggested that they might be much better employed against the infidels, who remained careless and unprepared, expecting the issue of the contest. Dom Sancho did not fail to profit by this advice; and after some movements intended to amuse the enemy, he made a sudden irruption into Andalusia, penetrating as far as Triana, one of the suburbs of Seville. The Moors assembled their forces, in order to attack him on his retreat, but were entirely defeated; and Dom Sancho returned to Portugal loaded with spoil. In 1184 the King of Morocco having already transported multitudes of men from Barbary, at length followed in person with a prodigious army, and carried all before him as far as the Tagus. He appeared before Santarem; but having exhausted and reduced his army by unsuccessful assaults on that place, he was attacked by the Portuguese, assisted by Ferdinand of Leon, and entirely defeated and slain. By this victory the Portuguese were left at liberty to improve the interior of their country, and to fortify their frontiers; but not long afterwards, that is, in the year 1185, the king died, in the seventy-sixth year of his age.

Sancho I.

Dom Affonso was succeeded by his son Dom Sancho I., who, by steadily applying himself to the work of restoration, in a short time quite changed the appearance of his territories, and acquired the glorious titles of The Restorer of Cities and Father of his Country. In the year 1189, a fleet, composed for the most part of English vessels, but having on board a great number of adventurers of other nations bound for the Holy Land, entered the river Tagus. Dom Sancho solicited them to assist him in a design he had formed of attacking the city of Silvas in Algarve, to which they readily assented. Having joined them with a squadron of his own galleys, and marched a body of troops by land, the place was reduced, and the English, according to agreement, were rewarded with the plunder. But in a short time, the Moors from Africa having once more invaded Portugal, the town was several times taken and retaken, until at last Dom Sancho, sensible of the difficulties of retaining it, caused it to be demolished. His last enterprise was the reduction of Elvas; soon after which he died, leaving the reputation of being the best economist that ever sat on the throne of Portugal. With the character of being rather liberal than avaricious, he had amassed a treasure of more than seven hundred thousand crowns in ready money, besides fourteen hundred merks of silver, and one hundred of gold plate, which he disposed of some time before his death. He was interred, by his own command, in the cathedral of Coimbra; and when his body was taken up four hundred years afterwards, that it might be laid in a new tomb, it was found uncorrupted.

Differences with Castile.

The history of Portugal presents scarcely any event of importance till the year 1289; when, in the reign of Don Diniz, a difference commenced with Castile which subsisted for a long period. Frequent reconciliations took place; but these were either of short duration, or never sincere. At length, in the reign of John I., Don Juan of Castile, who had also pretensions to the crown of Portugal, invaded that kingdom at the head of the whole force of his dominions, and with the flower of the Castilian nobility entered the province of Alemtejo. He besieged Elvas, but without effect; a disappointment which enraged him to such a degree, that he determined the following year to invade Portugal a second time, and lay waste the country before him. Accordingly, having collected an army of thirty thousand men, he invaded Portugal, and took and ruined several places; but the Portuguese in the end were victorious, although with an inferior force, and the Castilians consented to a truce of three years, which was soon afterwards improved into a lasting peace.

The city of Ceuta taken from the Moors.

In 1414 King John undertook a successful expedition against the Moors in Barbary, where he commanded in person, his queen, Philippa, the daughter of John, Duke of Lancaster, having died shortly before. The city of Ceuta was taken from the Moors almost at the first assault. Scarcely had the king left the country, when the princes of Barbary formed a league for the recovery of the place; but they were defeated by the young princes of Portugal. John strengthened the fortifications and augmented his forces there.

Madeira was discovered in 1420, and the Azores in 1432. King John died in 1433, and was succeeded by his eldest son Edward. The latter undertook an expedition against Tangier in Barbary, but the event proved very unfortunate; the Portuguese being so shut up by the Moors that, to obtain leave to return to Portugal, they were obliged to give up Ceuta. Although the king's son Ferdinand was left as a hostage for the delivery of Ceuta, the king and council of Portugal constantly refused to deliver up the place. Preparations were made for recovering the prince by force; but before anything could be accomplished, the king died in 1438.

Passage to the East Indies discovered.

However, the war with Barbary continued at intervals for many years, but with little success on the part of the Portuguese. In the reign of Affonso V. a civil war broke out, the two parties being headed by the king, and Pedro, the recent duke of Coimbra, who was finally defeated and killed at the battle of Alfarrobeira, 1449. The year 1497 was remarkable for the discovery of the passage to the East Indies by the Cape of Good Hope. The enterprising spirit of the Portuguese had, for a considerable time before, prompted them to undertake voyages along the coast of Africa, and when they found in the torrid zone, which the ancients had pronounced to be uninhabitable, fertile countries, occupied by numerous nations, and perceived that the continent of Africa, instead of extending in breadth towards the west, according to the opinion of Ptolemy, appeared to contract itself, and to bend eastwards, they were inspired with hopes of reaching India by continuing to hold the course they had so long pursued. After several unsuccessful attempts to accomplish what they had in view, a small squadron sailed from Belem, on the Tagus, under the command of Vasco de Gama, an officer of rank, whose abilities and courage fitted him to conduct this difficult and arduous enterprise. From ignorance, however, of the proper season and route of navigation in that vast ocean through which he had to steer his course, his voyage was long and dangerous. At length he doubled that promontory which had been descried by Bartolomeo Diaz in 1487, and which, for several years, had been the object of terror and of hope to his countrymen. After a prosperous navigation along the south-east coast of Africa, he arrived at the city of Melinda, and had the satisfaction of discovering there, as well as at other places where he touched, people of a race very different from the rude inhabitants of the western shore of that continent, which alone the Portuguese had hitherto visited. These he found to be so far advanced in civilization and acquaintance with the various arts of life, that they carried on an active commerce not only with the nations on their own coast, but with remote countries of Asia. Conducted by their pilots, who held a course with which experience had rendered them well acquainted, he sailed across the Indian Ocean, and landed at Calicut, on the coast of Malabar, on the 22d of May 1498, ten months and two days after his departure from the port of Lisbon. (See the article GAMA.)

The monarch of the country received them at first with that fond admiration which is often excited by novelty; but in a short time he formed various schemes to cut off Gama and his followers. The Portuguese admiral, however, was not to be overreached by such politics as his. From every danger to which he was exposed he extricated himself with singular prudence and dexterity, and at last sailed from Calicut with his ships, loaded not only with the commodities peculiar to that coast, but with many rich productions of the eastern parts of India. He returned to Portugal in two years after his sailing from the Tagus, but with a great loss of men; for out of one hundred and forty-eight persons who sailed with him, only fifty-five returned. The king received him with all possible testimonies of respect and kindness; created him a count; and not only declared him admiral of the Indies, but also made that office hereditary in his family.

The settlement of the Portuguese in India.

The Portuguese entered upon the new career opened to them with activity and ardour, and made exertions both commercial and military, far beyond what could have been expected from a kingdom of such inconsiderable extent. All these were directed by an intelligent monarch, Dom Manoel the Fortunate, who happily selected a succession of excellent officers to take the supreme command in India, amongst whom Affonso Albuquerque was eminent. Within twenty-four years after the voyage of Gama the Portuguese had rendered themselves masters of the city of Malacca, in which the great staple of trade carried on with the East Indies was then first established. This conquest secured to them great influence over the interior commerce of India, whilst, at the same time, by their settlements at Goa and Diu, they were enabled to engross the trade of the Malabar coast and to obstruct greatly the long-established intercourse of Egypt with India by the Red Sea. In every part of the East they were received with respect; in many they had acquired the absolute command. They carried on trade there without rivalry or control; they prescribed to the natives the terms of their mutual intercourse; they often fixed what price they pleased on the goods which they purchased; and they were thus enabled to import from Hindustan, and the regions beyond it, whatever was useful, rare, or agreeable, in greater abundance, and of more various kinds, than had been formerly known in Europe.

Opposition made by the Venetians.

Not satisfied with this ascendancy which they had acquired in India, the Portuguese sought to exclude all other nations from participating in the advantages of commerce with the East; and they accomplished one-half of what their ambition had planned. In consequence of this the Venetians soon began to feel that decrease of their own Indian trade, which they had dreaded. In order to prevent the farther progress of this evil, they incited the Soldan of the Mamlukes to fit out a fleet in the Red Sea, and to attack those unexpected invaders of a gainful monopoly, of which he and his predecessors had long enjoyed undisturbed possession. The Portuguese, however, entirely defeated this formidable squadron, and remained masters of the Indian Ocean. They continued their progress in the East almost without obstruction, until they established there a commercial empire; to which, whether we consider its extent, its opulence, the slender power by which it was formed, or the splendour with which the government of it was conducted, there had hitherto been nothing comparable in the history of nations. Every part of Europe was supplied by the Portuguese with the productions of the East; and if we except an inconsiderable quantity which the Venetians still continued to receive by the ancient channels of conveyance, our quarter of the globe had no longer any commercial intercourse with India and the regions of Asia beyond it except by the Cape of Good Hope.

Inquisition introduced into Portugal.

In September 1521 Manoel died of a fever, and was succeeded by his son John III. The most remarkable transaction of this prince's reign was the introduction of the Inquisition into his dominions in the year 1525, or, as some say, in 1535. A famine happening to cease in a short time after the Holy Office was introduced, the priests persuaded the ignorant multitude that it was a blessing from heaven on account of erecting such a tribunal.

Solyman the Magnificent.

Conduct and policy of the Portuguese.

In the meantime Solyman the Magnificent, the most enlightened monarch of the Ottoman race, observing the rising power and opulence of the Portuguese, and eager to supplant them, sent orders to the Pasha of Egypt to employ his whole strength against the Christians in the East Indies. The pasha, in obedience to these orders, sailed from the Red Sea with a greater naval force than ever the Mohammedans had employed before, having 4000 Janizaries and 16,000 other troops on board. Yet, by the courage and conduct of the Portuguese officers and soldiers, all this mighty armament was defeated, and their East India possessions were saved from the danger which threatened them. In Africa, likewise, the King of Fez was baffled before the town of Safi; whilst fresh quarrels breaking out amongst the native princes, gave great relief to the Christians, who had long been obliged to carry on a defensive war, and had more than once been on the very brink of ruin. The Moors became more and more formidable; the Portuguese king had reason to deem that the conquest of Barbary was impossible, and therefore limited his ambition to keeping those few fortresses which he had already acquired; a necessary and prudent measure which nevertheless displeased the majority of his subjects.

Brazil.

King John exerted himself greatly in the settlement of Brazil, which had been discovered by Pedro Alvares Cabral in 1501. He caused several strong towns to be erected there, and took all possible methods to encourage the conversion of the natives to Christianity. He also introduced many regulations for the welfare and happiness of his subjects at home. The disputes of the nobility about precedency were frequently attended with disagreeable consequences, which made the king resolve to establish definitive rules. His death happened in June 1557; and he was succeeded by his son Dom Sebastian, an infant of three years of age.

Education of the young king

The administration of affairs was undertaken by the queen grandmother of Sebastian. The Moors, however, supposing that they might be able to dispossess the Christians of such places as they held in Barbary, laid close siege to Mazagan. But the queen-regent speedily sending succour, the Moors, although they brought 80,000 men into the field, were obliged to abandon the enterprise. This was at first extolled as a conspicuous instance of the queen's capacity and wisdom; but, in a short time, the aversion which the Portuguese had to the government of women, together with the prejudice they had against her country, for she was a Castilian, appeared so plainly, and gave her so much uneasiness, that of her own accord she resigned her authority into the hands of the Cardinal Dom Henry, the king's brother.

Sebastian undertakes an expedition against Africa.

After the king had grown up to man's estate, his desire was to distinguish himself against the infidels. He himself intended to conduct an expedition to the East Indies; but the prime minister Alcocova induced him to direct his attention to Africa. This expedition the king entered into in the most inconsiderate and absurd manner. He first sent for a prior, with some hundreds of soldiers; next he carried his principal courtiers with him from a hunting match, and without equipages; he then sent for the Duke of Aveyro, who brought with him such troops as he could collect on so short a warning; and when all these were assembled, the king spent his time in hunting, and slight excursions against the enemy, without doing anything of consequence, except exposing his person upon all occasions. He returned to Portugal, but only for the purpose of arranging another expedition, and it seemed to him that he had a pretence for commencing another campaign in the state of affairs in Morocco. Muley Hamet, King of Fez and Morocco, had been dispossessed of his dominions by his uncle Muley Moloch. At the beginning of this war Dom Sebastian had offered him the Portuguese troops in Africa, a tender which was rejected with contempt; but now being a fugitive, and having in vain solicited assistance from Philip of Spain, Muley Hamet applied to the King of Portugal; and, that he might the more easily succeed, he caused the fortress of Arzila, which his father had recovered, to be restored to the Portuguese. The king was in rapture at this event, and fancied that his glory would exceed that of all his predecessors. The queen-dowager, the cardinal, and all his friends united in their endeavours to divert him from this unfortunate enterprise. Even Philip of Spain, his uncle, attempted to convince him of the absurdity of his proceedings. Muley Moloch himself explained in a letter his own right to the crown of Fez, and showed that he had only dispossessed a tyrant and a murderer, who had therefore no right to his friendship or assistance. The Moorish prince next assured him that he had no reason to fear either the power or the neighbourhood of the Portuguese; and as a proof of this, as well as a mark of his esteem, he was content to make him a present of some 10 miles of arable ground round each of the fortresses he possessed in Africa, viz., Tangier, Ceuta, Mazagan, and Arzilla. But the King of Portugal was deaf to all salutary advice, and disregarded all remonstrances.

New expedition to Africa.

On the 24th of June 1577 he set sail from the bar of Lisbon with a fleet of fifty ships and five galleys, twelve pieces of cannon, and many transports and tenders, making in all nearly a thousand sail. His troops consisted of 9000 Portuguese infantry, 3000 Germans, 700 Italians, commanded by Sir Thomas Stukeley, an English exile, remarkable for his bravery; 2000 Castilians, and 300 volunteers, commanded by Christoval de Tuvara, master of the horse, a man of courage, but without either conduct or experience. He touched first at Lagos Bay, where he remained for four days, and thence he proceeded to Cadiz, where he was feasted for a week by the Duke de Medina Sidonia, who fruitlessly endeavoured to dissuade him from proceeding further in person.

Soon after landing in Africa the king was met by Muley Hamet, who delivered him his son, a boy of twelve years of age, as a hostage, and brought a reinforcement of three hundred Moors. Here it was resolved in a council of war to reduce the town of Larache, but it was disputed whether the troops should proceed thither by land or by sea. Dom Sebastian, who espoused the former opinion, finding himself opposed by Muley Hamet, answered him so rudely that he left his presence in disgust.

Muley Moloch, having received intelligence of this formidable invasion, took the field with 40,000 foot and 60,000 horse, and conducted every thing with the greatest prudence, notwithstanding he was so enfeebled by fever that he could not sit upon horseback. He advanced against the Portuguese army with such celerity that he came in sight of them on the 3d of August at Alcacer Quibir. Finding his disease increase to such a degree that he had no hopes of recovery, he resolved to lose no time in bringing on the battle, that his antagonist might not avail himself of his death. The disposition of the Christian army was, through the care of some old officers in Dom Sebastian's service, regular and correct.

The Portuguese army entirely defeated.

The Christians advanced with resolution, broke the first line of the Moorish infantry, and disordered the second. On this Muley Moloch drew his sword, and would have advanced to encourage his troops, but his guards prevented him, on which his agitation became so great that he fell from his horse. One of his guards caught him in his arms, and conveyed him to his litter, where he immediately expired, having only time to lay his finger on his lips by way of enjoining them to conceal his death. But by this time the Moorish cavalry had wheeled quite round, and attacked the Christian army in the rear; the Portuguese right was broken, and at this time Muley Hamet in passing a river was drowned. In this emergency the Germans, Italians, and Castilians performed prodigies; but the Portuguese, according to their own historians, behaved indifferently. Attacked on all sides, however, they were unable to resist; and the whole army, except about fifty men, were killed or taken prisoners. The fate of the king is variously related. According to some, he had two horses killed under him, and then mounted a third. His bravest officers were killed in his defence; after which the Moors surrounded him, seized his person, stripped him of his sword and arms, and secured him. They immediately began to quarrel about the prisoner, upon which one of the generals rode in amongst them, crying, "What, you dogs, when God has given you so glorious a victory, would you cut one another's throats about a prisoner? At the same time, discharging a blow at Sebastian, he brought the king to the ground, when the rest of the Moors soon dispatched him. Others affirm that one Louis de Brito meeting the king with the standard wrapped round him, Sebastian cried out, "Hold it fast; let us die upon it;" upon which charging the Moors, he was seized, but rescued by Brito, who was himself taken with the standard, and carried to Fez. The latter affirmed, that after he was taken he saw the king at a distance, and unpursued. Dom Louis de Lima met him afterwards making towards the river; and this is the last account of his being seen alive.

Immediately after the battle, the brother of Muley Moloch was proclaimed king by the Moors. The next day, having ordered all the prisoners to be brought before him, the new sovereign gave orders to search for the body of Dom Sebastian. The king's valet-de-chambre brought back a body, which he said was that of his master, but so disfigured with wounds that it could not well be known; and, notwithstanding the most diligent search, this monarch's death could never be properly authenticated. This body, however, was delivered up as the body of the unfortunate Dom Sebastian to Philip, King of Spain. By the latter it was sent to Ceuta, thence transported to Portugal, and buried amongst his ancestors in the monastery at Belem, with all possible solemnity.

By this disaster, the kingdom of Portugal sunk at once into the lowest rank of European states. All the young nobility were cut off or carried into slavery, and the kingdom was exhausted of men, money, and reputation; so that Dom Henry, who assumed the government after the death of his brother Sebastian, found himself in a very disagreeable situation. At his death the crown of Portugal was claimed by three different competitors,—viz., the Prince of Parma, the Duchess of Braganza, and Philip of Spain. Whatever might have been the merits of their respective claims, the power of Philip quickly decided the contest in his favour. He found his schemes facilitated by the treachery of the regents.

Portugal conquered by Philip of Spain.

Philip finding everything in his favour, commanded the Duke of Alva to invade Portugal at the head of 20,000 men; whereupon, after a feeble defence made by Dom Antonio, prior of Crato, who had been placed on the throne by the Portuguese, the whole kingdom submitted.

Terms granted by him to his new subjects.

Philip made his entry into Lisbon as soon as the kingdom had been totally reduced, and endeavoured to conciliate the affections of the people by confirming the terms which he had before offered to the States. These terms were, that he would take a solemn oath to maintain the privileges and liberties of the people; that the States should be assembled within the realm, and nothing proposed in any other States that related to Portugal; that the viceroy or chief governor should be a native, unless the king should give that charge to one of the royal family; that the household should be kept on the same footing; that the post of first president, and all offices, civil, military, and judicial, should be filled by Portuguese; all dignities in the church and in the orders of knighthood confined to the same; the commerce of Ethiopia, Africa, and the Indies reserved also to them, and to be carried on only by their merchants and vessels; that he would remit all imposts on ecclesiastical revenues; that he would make no grant of any city, town, or jurisdiction royal, to any but Portuguese; that estates resulting from forfeitures should not be united to the domain, but go to the relations of the last possessor, or be given to other Portuguese in recompense of services; that when the king came to Portugal, where he should reside as much as possible, he should not take the houses of private persons for his officers' lodgings, but keep to the custom of Portugal; that wherever his majesty resided, he should have an ecclesiastic, a treasurer, a chancellor, two masters of requests, with inferior officers, all of them Portuguese, who should despatch everything relating to the kingdom; that Portugal should ever continue a distinct kingdom, and its revenue be consumed within itself; that all matters of justice should be decided within the realm; that the Portuguese should be admitted to charges in the households of the King and Queen of Spain; that all duties on the frontiers should be taken away; and lastly, that Philip should give three hundred thousand ducats to redeem prisoners, repair cities, and relieve the miseries which the plague and other calamities had brought upon the people.

Treatment of Dom Antonio.

All these concessions, however, failed to answer the purpose; nay, although Philip was to the last degree lavish of honours and employments, the Portuguese were still dissatisfied. Dom Antonio, the exiled prince, still styled himself "King of Portugal." At first he retired to France, where he found so much countenance that, with a fleet of nearly sixty sail, and a considerable body of troops on board, he made an attempt upon Terceira, where his fleet was beaten by the Spaniards. Dom Antonio was constrained to retire, which he did with some difficulty, and going to England, he was well received there. After Philip had ruined the naval power of Portugal, as well as that of Spain, by equipping the Armada, Queen Elizabeth assisted Dom Antonio, and sent Sir John Norris and Sir Francis Drake with a strong fleet and a considerable army to restore him. Upon this occasion Dom Antonio sent his son Dom Christoval a hostage to Muley Hamet, King of Fez and Morocco, who was to lend him 200,000 ducats. But Philip prevented this by surrendering Arzila; which, with the unseasonable enterprise against Coruña, and the disputes that arose between Norris and Drake, rendered the expedition abortive; so that, except carrying the plague into England, it was attended with no consequences worthy of notice. Dom Antonio remained some time afterwards in England; but finding himself disregarded, he withdrew once more into France, where he fell into great poverty and distress; and having at length died in the sixty-fourth year of his age, an inscription was placed on his tomb, in which he was styled "king." He left behind him several children, who, on account of his being a knight of Malta, and having made a vow of chastity at his entrance into the order, were looked upon as illegitimate.

Impostors pretending to be Dom Sebastian.

But Dom Antonio was not the only pretender to the crown of Portugal. The people, partly from love of their prince, and partly from their hatred to the Castilians, were continually feeding themselves with the hopes that Dom Sebastian would appear and deliver them; and in this respect such a spirit of credulity reigned, that they would probably have taken a Negro for Dom Sebastian. This humour induced the son of a tiler at Alcobaça, who had led a profligate life, and at length turned hermit, to give himself out as that prince; and having with him two companions, one of whom styled himself Dom Christoval de Tavora, and the other the Bishop of Guarda, they began to collect money, and were in a fair way of creating much disturbance. But the cardinal archduke caused them to be apprehended, and after leading them ignominiously through the streets of Lisbon, he who took the name of Sebastian was sent to the galleys for life, and the pretended bishop was hanged. Not long afterwards, Gonsalo Alvarez, the son of a mason, gave himself out as the same king, and having promised marriage to the daughter of Pedro Alonso, a rich yeoman, whom he created count of Torres Novas, he assembled a body of about 800 men, and some blood was spilt before he was apprehended. At length, being clearly proved to be an impostor, this person and his intended father-in-law were publicly hanged and quartered at Lisbon. The punishment, however, instead of extinguishing public credulity, served only to increase it.

About twenty years after the fatal defeat of Sebastian, there appeared at Venice a person who created much more trouble. He assumed the name of Dom Sebastian, and gave a very distinct account of the manner in which he had passed his time since that defeat. He affirmed that he had preserved his life and liberty by hiding himself amongst the slain; that, after wandering in disguise for some time in Africa, he returned with two of his friends into the kingdom of Algarve; that he gave notice of this to the king Don Henry; that finding his life sought, and being unwilling to disturb the peace of the kingdom, he returned again amongst the Moors, and passed freely from one place to another in Barbary, in the habit of a penitent; and that after this he became a hermit in Sicily, but at length resolved to go to Rome, and discover himself to the Pope. On the road he was robbed by his domestics, and came almost naked to Venice, where he was known and acknowledged by some Portuguese. Complaint, however, being made to the Senate, he was obliged to retire to Padua. But as the governor of that city also ordered him to depart, he, not knowing what to do, returned to Venice, where, at the request of the Spanish ambassador, who charged him not only with being an impostor, but also with many black and atrocious crimes, he was seized and thrown into prison. In the examinations he underwent, he not only acquitted himself of the crimes which had been laid to his charge, but entered into so minute a detail of the transactions which had passed between himself and the republic, that the commissioners were perfectly astonished; and, moved by his behaviour, they showed no disposition to declare him an impostor. The noise of this was diffused throughout Europe, and the enemies of Spain endeavoured everywhere to give it credit.

The State however refused to discuss the point, whether he was or was not an impostor, unless they were requested so to do by some prince or state in alliance with them. Upon this the Prince of Orange sent Dom Christoval, the son of the late Dom Antonio, to make that demand; and at his request an examination was instituted with great solemnity. But no decision followed; only the Senate set him at liberty, and ordered him to depart from their dominions. By the advice of his friends, therefore, he proceeded to Padua in the disguise of a monk, and from thence to Florence, where he was arrested by the command of the grand duke, who delivered him up to the viceroy of Naples. He remained several years prisoner in the castle Del Ovo. At length he was brought forth, led with infamy through the streets of the city, and declared to be an impostor who assumed the name of Sebastian; at which words he said gravely, "And so I am." In the same proclamation it was affirmed that he was in truth a Calabrian; but as soon as he heard this he said, "It is false." He was next shipped on board a galley as a slave, and carried to San Lucar, whence, after being for some time confined there, he was transferred to a castle in the heart of Castile, and never heard of more. Some persons were executed at Lisbon for their endeavours to raise an insurrection in his behalf.

Bad consequences of the Spanish administration.

The administration of affairs in Portugal, during the reign of Philip, was certainly detrimental to the nation; and yet it does not appear that this proceeded so much from any ill intention in that monarch, as from errors in judgment. His prodigious preparations for the invasion of England impoverished all his European dominions; but it absolutely exhausted Portugal. Yet the government of Philip was so much better than that of his immediate successors that his death was justly regretted, and the Portuguese were taught by experience to confess that, of bad masters, he was the best.

Philip III. and Philip IV.

His son Philip, the second of Portugal and the third of Spain, sat twenty years upon the throne before he paid a visit to Portugal, where the people put themselves to a most enormous expense to receive him. He held an assembly of the States, in which his son was sworn as his successor. The reigns of Philip III. and Philip IV. were characterized by a series of bad measures and worse fortune. All their dominions suffered greatly; Portugal most of all. The loss of Ormus in the East, and of Brazil in the West, together with the shipwreck of a fleet sent to escort one of merchantmen from Goa, brought the nation incredibly low, and encouraged the Conde duke to hope that they might be entirely crushed. These are the heads only of the transactions of forty years. To enter in any degree into particulars, would only be to point out the breaches made by the Spanish ministers in the conditions granted by Philip; which, with respect to the nation, was the original contract and unalterable constitution of Portugal whilst subject to the monarchs of Castile, but which, notwithstanding, they often flagrantly violated.

The very basis and foundation of their privileges was, that the kingdom should remain separate and independent, and consequently that Lisbon should continue as much its

The Portuguese oppressed by the Spaniards.

capital as ever. But so little was this observed, that neither promotion nor justice was to be obtained without journeys to Madrid, which was not more the capital of Castile than it was that of Portugal. The general assembly of estates was to be held frequently, and they were only held thrice in the space of sixty years; two of them being held within the first three years. The king was to reside in this realm as often and as long as possible. Philip I., however, was there but once; Philip II. resided only four months; and Philip III. never at all. The household establishment was suppressed during all these reigns. The viceroy was to be a native of Portugal, or a prince or princess of the blood; yet when any of the royal family bore the title, the power was in reality in the hands of a Spaniard. Thus, when the Princess of Mantua was vice-queen, the Marquis de la Puebla was sent to assist her in council, and she could do nothing without his advice. The council of Portugal, which was to be composed entirely of natives, was filled with Castilians, as the garrisons also were, though the contrary had been provided. The presidents of provinces, or corregidors, were to be natives; but, by keeping those offices in his own hands, the king eluded this article. No city, town, or district was to be given to any except Portuguese; yet the Duke of Lerma had Beja, Serpa, and other parts of the demesnes of the crown, which were formerly appendages of the princes of the blood. None but natives were capable of offices in the courts of justices, in the revenue, in the fleet, or of holding any post civil or military; yet these were given promiscuously to foreigners, or sold to the highest bidder, not excepting the government of castles, cities, and provinces. The natives were so far from having an equal chance in such cases, that no situations in the presidios were ever given to them, and scarcely any in garrisons; and whenever it occurred, in the case of a person of extraordinary merit, whose pretensions could not be rejected, he was either removed, or not allowed to exercise his charge, as happened to the Marquis of Marialva and others. The forms of proceeding, the jurisdiction, the ministers, the secretaries, were all changed in the council of Portugal, being reduced from five to three, then two, and at last to a single person.

A revolution in favour of the Duke of Braganza.

By reason of these and other grievances, the detestation of the Spanish government became universal; and in 1640 a revolution soon took place, in which John, Duke of Braganza was declared king, by the title of John IV. This revolution, as being determined by the almost unanimous voice of the nation, was attended with very little effusion of blood. Several vain attempts were made by the King of Spain to regain his authority. The first battle was fought at Montijo in 1644, between a Portuguese army of 6000 foot and 1100 horse, and a Spanish army of nearly the same number. The latter were entirely defeated; and this contributed greatly to establish the affairs of Portugal on a firm basis. The Portuguese king carried on a defensive war during the remainder of his life; and after his death, which happened in 1655, the war was renewed with great vigour.

Perilous state of Portugal on his death.

This was what the Spaniards did not expect. It would not, indeed, be easy to conceive a kingdom left in more perilous circumstances than Portugal was at this time. The king, Dom Affonso Enrique, was a child not more than thirteen years of age, reputed of unsound constitution both of body and mind; the regency was in a woman, and that woman a Castilian; the nation was involved in a war respecting the title to the crown; and the nobility, some of them secretly disaffected to the reigning family, were almost all of them embarked in feuds and contentions with each other; so that the queen scarcely knew whom to trust or how she should be obeyed. She acted, however, with great vigour and prudence. By marrying her only daughter, the Princess Catherine, to Charles II., King of Great Britain, she procured for Portugal the protection of the English fleets, with reinforcements of some thousands of horse and foot; and at last, in 1665, the war was terminated by the glorious victory of Montesclaros. This decisive action broke the power of the Spaniards, and fixed the fate of the kingdom, though not that of the King of Portugal. Affonso was a prince whose education had been neglected in his youth, who was devoted to vulgar amusements and mean company, and whom the queen for these reasons wished to deprive of the crown, that she might place it on the head of his younger brother Dom Pedro. The Portuguese, however, would not consent to set aside the rights of primogeniture, and involve the kingdom in all the miseries attending a disputed succession.

Dom Affonso obliged to resign the throne.

Affonso was compelled to sign a resignation of the kingdom; and his brother, after governing a few months without any legal authority, was in a meeting of the States unanimously proclaimed regent, and vested with all the powers of royalty. Soon after this revolution, for such it may be called, the marriage of the king and queen was declared null by the chapter of Lisbon; and the regent, by a pontifical dispensation, and with the consent of the States, immediately espoused the divorced lady. He governed, under the title of regent, fifteen years, when, upon the death of the king, he mounted the throne by the title of Dom Pedro II.; and after a long reign, during which he conducted the affairs of the kingdom with great prudence and vigour, he died in 1706.

Dom John V.

Dom John V. succeeded his father; and though he was then little more than seventeen years of age, he acted with such wisdom and resolution, adhered so steadily to the grand alliance formed against France and Spain, and showed so great resources in his own mind, that though he suffered severe losses during the war, he obtained such terms of peace at Utrecht, that Portugal was in all respects a gainer by the treaty. The two crowns of Spain and Portugal were not, however, thoroughly reconciled until the year 1737. In 1750 a treaty was concluded with the court of Madrid, by which Nova Colonia, on the river Plata, was ceded to his Catholic majesty, to the great regret of the Portuguese, as well on account of the value of that settlement, as because they apprehended that their possession of the Brazils would by this cession be rendered precarious. The king died in 1750, worn out by infirmities.

Dom Joseph I.

He was succeeded by his son Joseph I., who ascended the throne of Portugal under very favourable circumstances; but his reign, although short, was marked by great national calamities. The most remarkable event which occurred was the memorable earthquake, which, in November 1755, destroyed one half of the city of Lisbon, and buried thirty thousand people under the ruins. Two hours had scarcely elapsed after this terrible convulsion, when, to aggravate its horrors, flames burst forth from different quarters of the city, and the conflagration raging with terrific violence for three days, Lisbon was completely desolated. The royal family were fortunate enough to escape; but amongst the victims were the Spanish ambassador, and many other persons of distinction. Britain promptly afforded relief to the sufferers; an act of generosity the more honourable to her, as she had every reason to be dissatisfied with the conduct of the King of Portugal. From the commencement of his reign, he had thrown great obstructions in the way of our commerce, evading treaties, and imposing vexatious imposts; and it seemed perfectly clear that his object was to annihilate the commercial intercourse which had for so many ages subsisted between the two countries. The same spirit of humanity was evinced by Spain; but both nations received an unworthy return, although Britain had most to complain of.

Scarcely had the agitation which this calamity gave rise to subsided, when Portugal was again thrown into commotion by an attempt to assassinate the king (3d Sept. 1758), who was wounded one night near his palace at Belem. Suspicion fell on various classes of persons, particularly on certain ecclesiastics, who were said to have been incensed at the reform introduced by Dom Joseph; on the creatures of Spain, who aspired to the reunion of the two kingdoms under one sceptre; on the Jesuits, who were represented as indignant at the restriction of their ancient privileges; and on a prince of the royal family. All that is known with certainty is, that the scaffold flowed with noble blood; and that the Jesuits were stripped of their possessions, whilst their expulsion was decreed by the crown. Another occurrence of this reign was a rupture with the see of Rome, every servant of the Pope being expelled from Portugal, and all intercourse between the two courts suspended for about two years. A more important event was the invasion of the country by Spain. This aggression originated in the refusal of the king to join the alliance of France and Spain against England. War was immediately declared against him, and troops marched to the frontiers of his kingdom. The ally whom he had so long neglected, and even deliberately ill-used, was appealed to, and not in vain. Troops, arms, and all necessary munitions of war, arrived from Britain; and although the invaders succeeded in capturing Miranda, Braganza, and Almeida, their triumphs were speedily put a stop to by the combined forces of Britain and Portugal. At the instance of the British cabinet, the Count de Lippe was brought from Germany to assume the command of the whole army. This commander was ably assisted in his operations by General Burgoyne, and they had soon the glory of freeing the country from the Spanish army. The consequence of this triumph was a peace, solicited and obtained by the two hostile courts, now hopeless of success, and in apprehension of fresh disasters.

The remainder of this king's reign, extending from the year 1763 to 1777, was occupied by the introduction of measures for social, agricultural, and commercial improvement. He laboured to improve the police and judicial administration, and not without success. He founded schools in the large towns, and improved the system of study in the university of Coimbra. He encouraged agriculture, the fisheries, and trade with the colonies; but in attempting to give a stimulus to home manufactures, by laying such duties on articles of British produce as amounted to an almost total exclusion of them from the Portuguese market, he acted with equal short-sightedness and ingratitude. One monument to his honour, more noble than the statue of bronze which his grateful subjects erected to him in Lisbon during his lifetime, remains to be mentioned. This was a decree by which the grandsons of slaves, and all who should be born after the date thereof, were declared free. Although this benefit was confined to Portugal alone, yet, considering the state of matters at the time it was conferred, it must be regarded as an amazing stride in the career of improvement. Joseph I. died in 1777, and was mourned by his people as the best monarch who had swayed the sceptre of Portugal since the days of Philip I. The prosperity of his reign was owing in great measure to the ability of his minister, the Marquis of Pombal, who, from his antipathy to the Jesuits and ecclesiastical tyranny, has been vigorously decried by the papal party ever since. Pombal's diplomatic correspondence and papers relating to the period 1738–47 were obtained for the British Museum in 1855.

Maria.

Joseph was succeeded by his daughter Maria, whom the necessities of state had induced her father to give in marriage to his own brother. Such revolting connections are unhappily far from rare in the modern history of Portugal. Some attempts were made to exclude her in favour of a nephew, but they proved completely abortive. Though the abilities of this queen were limited, yet she was actuated by good intentions. Her administration was feeble, but upon the whole beneficial. She followed the example of her father in encouraging national industry and reforming the administration of justice. She founded the Academy of Sciences, introduced into the convents of friars a compulsory form of general education, endowed several admirable charitable institutions, and went so far in judicial reform as to abolish the law of imprisonment for debt. In short, had her foreign policy resembled her domestic administration, Portugal would have had no reason to complain of her. Maria was forced into a family compact by her powerful neighbours of France and Spain, by which the influence of the latter was strengthened and confirmed, whilst in the same degree that of England was weakened. This alliance was accompanied by a treaty of limits, which fixed the boundaries of Brazil, Paraguay, and Peru, the arrangement being peculiarly favourable to Spain.

In the year 1792 the queen exhibited symptoms of mental alienation, and John Maria Joseph, prince of Brazil, was appointed regent. One of the first acts of his administration was a declaration of war against the French republic, a step which he was induced to take from his connection with England. But commercial distress, the accumulating debt of the country, and the menacing language which France compelled Spain to adopt towards her neighbour, led to a peace in 1797. In 1799 the malady of the queen appearing to be incurable, the prince was confirmed in the regency, with full regal powers; but he made no change in the policy of the government. The same year he was again encouraged to arm against French aggression, in alliance with England and Russia; the victorious career of the revolutionists having received a severe, although, as it proved, only a temporary check. After Napoleon had confirmed his ascendancy, Spain was under the necessity of declaring war against Portugal in the year 1801; but it was soon terminated by the treaty of Badajoz, in consequence of which Portugal was compelled to cede Olivenza to Spain, and likewise to pay a considerable sum of money. After this the prince enjoyed but a mere shadow of power, and at considerable sacrifices maintained a nominal independence, until at last, in 1807, a hostile army under Marshal Junot invaded Portugal, and the House of Braganza was declared by Napoleon to have forfeited the throne. This bold declaration was owing to the prince having refused to seize the English property in his dominions. Having embarked with his family for Brazil, the French general immediately afterwards took possession of his capital, and Portugal sank into the condition of an appendage of France.

Junot issued a proclamation, in which he declared that justice should be duly administered, tranquillity preserved, and the future happiness of the people solicitously guarded. But these professions were far from satisfying a people of whom the lower classes were dying of absolute want, and two-thirds of the merchants were bankrupt. A British force under the Duke of Wellington (then Sir Arthur Wellesley) was promptly despatched to Portugal, where it was joined by a considerable body of national troops, now mustered in the northern provinces, and determined to maintain the struggle for freedom. A Junta was immediately established in Oporto, to conduct the government. After some sharp skirmishing between the two armies, the decisive battle of Vimeiro, which was fought on the 21st of August 1808, overthrew the power of France in Portugal. The severely-censured convention of Cintra followed, and the country was evacuated by the French troops. The immediate consequences of this evacuation were highly beneficial. The government displayed an energy which restored subordination, and was felt all over the kingdom. A levy *en masse* of the whole male inhabitants, from fifteen to sixty years of age, was demanded; but it does not appear that the call was responded to with much alacrity. Towards the close of the year 1808, Madrid having surrendered, and the British army under Sir John Moore having been compelled to retreat through the mountains of Galicia to Coruña, the subjugation of Portugal was again resolved upon by the French. The intelligence of the approaching invasion at first spread consternation and dismay throughout Portugal, for it was in no condition to offer any serious resistance to the force of the enemy that menaced the frontiers. But fresh re-inforcements arrived from Britain, and General Beresford, who had been appointed commander-in-chief of the armies of Portugal, having established a system of subordination and discipline amongst the troops, confidence was in a great measure restored before a blow could be struck.

Marshal Soult entered the kingdom of Portugal at the head of the French army, after dispersing the Spanish force in Galicia. He was feebly opposed by the Portuguese. Their commander, General Freyre, was opposed to a regular engagement; but his unruly troops rose in mutiny and massacred both him and his supporters, under the suspicion of treachery. They were led against the enemy by Baron Eben, a German in the British service, and a battle was fought and lost. Soult then invested Oporto, and although the city had been strongly fortified and garrisoned, it was carried by assault on the 29th of March 1809, after a feeble defence of only three days. Immediately on entering the town, the French soldiery commenced an indiscriminate slaughter of the inhabitants; and although their commander used every effort to repress their fury, the plunder and licentiousness had continued a day and a night before subordination could be restored. The defeat of the Spanish army at Medellin opened an easy road to Lisbon; but the French force was divided into three separate bodies, under three independent commanders, Soult, Victor, and Lapisse, though, from fear of being separately committed, the whole remained inactive, or only engaged in insignificant manœuvres. Each commander appears to have waited for intelligence as to the movements of the others, and by this delay the capital was saved. Such was the situation of affairs when Sir Arthur Wellesley landed at Lisbon on the 23d of April, and assumed the chief command of the armies of England and Portugal. By a series of brilliant manœuvres, the British commander compelled the French to abandon Portugal. But Napoleon being pledged to his people and the world to conquer that country, early in 1810 an army of seventy-two thousand men was assembled in the vicinity of Salamanca, and the command of it intrusted to Marshal Massena. After clearing his way to Portugal, by the capture of several strongly-fortified places, the French general advanced upon Lisbon. But his vigilant enemy had well employed the time afforded him, by preparing a secure asylum for his troops, by which he at once kept his footing in the Peninsula, and defended Lisbon against a greatly superior force. This formidable defensive position is celebrated in military annals by the name of the lines of Torres Vedras. The advance of Massena, the battle of Busaco, the stand made at Torres Vedras, the retreat of the French, and their final evacuation of Portugal, will be found described in the article BRITAIN. It is true, that in the subsequent operations of the war, some parts of the kingdom were included in the theatre of hostilities, yet they never extended much beyond the frontiers. During the remainder of the war, however, the troops of Portugal bore an active and creditable part in almost every encounter with the enemy.

On the death of Maria, John VI. ascended the throne of Portugal and Brazil. The establishment of the court of Lisbon in an American settlement, though productive of little good to the mother-country, led to important results. In the first place, it induced Brazil to withdraw itself from dependence on England; and secondly, it paved the way for that colony erecting itself into a separate state. But the influence of England in Portugal continued, and the condition of the kingdom for the present remained essentially unchanged by the transference. The peace of Paris, concluded in May 1814, which, it was believed, would place everything on a proper basis, did not realize the expectations of the nation. Spain evaded the restitution of Olivenza, which had been provided for by the congress of Vienna; whilst, at the same time, Portugal was required to restore French Guiana to France. The court of Rio therefore took possession of the Banda Oriental; but an account of these transactions has been given in another part of this work (see BRAZIL). These circumstances rendered the condition of Portugal far from tranquil. The country felt that the order of things had been inverted, and the parent state had become a dependent on her colony. A conspiracy of a very extensive nature was discovered in the army, and its progress checked; but the spirit which generated it was not extinguished. In short, everything was ripening for a fundamental change in the administration and constitution of government; and the Portuguese people were soon afforded an opportunity of showing their dislike of the absence of the court, and the predominance of English influence. The continual bickerings between the commander of the forces and the regency induced Marshal Beresford to repair to Rio de Janeiro to obtain fresh instructions, and, it might be, fresh powers from the king; but during his absence that revolution burst forth which completely changed the whole political aspect of the kingdom.

The first symptoms of this revolution were exhibited at Oporto on the 24th of August 1820, both the citizens and the army acting in concert. The soldiers swore fealty to the king, the Cortes, and the constitution which might be adopted, and the civil authorities declared in favour of the measure. A junta of thirteen members was chosen by acclamation; and a declaration was addressed to the nation, stating, that the assembling of the Cortes and the adoption of a new constitution were the only means of saving the state. On the 15th of September, the day on which it was usual to celebrate the deliverance of Portugal from France, the regency in Lisbon, fearing to assemble such a multitude of people as generally met on that day, resolved to omit the ceremony. But the troops and the citizens met and deposed the government, declared for the king, the Cortes, and the constitution, and installed a temporary council as a provisional government. Thus a complete revolution was effected without either violence or bloodshed. The provisional government formed a union with the Junta of Oporto on the 1st of October; and one of the earliest acts of this united body was to despatch Count Palmella, the head of the royal regency, to Brazil, with an account of the transactions which had just taken place, and a petition that either the king or the prince-royal would return to Europe and assume the sovereignty of Portugal. One deputy was chosen for every thirty thousand inhabitants. Clergymen, lawyers, and officers were the sorts of persons who were chiefly elected, few men of wealth or family being chosen. On the 26th of January 1821, the Cortes met and named a regency and ministry, declared the late insurrections legal and necessary, and abolished the Inquisition. On the 9th of March the articles of the new constitution were adopted almost unanimously. By these, freedom of person and property was guaranteed, and the liberty of the press, legal equality, the abolition of privileges, the admission of all citizens to all offices, and the sovereignty of the nation, were secured. One chamber and a conditional royal veto were likewise resolved upon.

John VI. returned from America, leaving his eldest son, Dom Pedro, regent of Brazil. He was under the necessity of acceding to certain restrictions on his power, imposed by the Cortes, before he was permitted to disembark. On landing, he swore to observe the new constitution, and concurred in all the succeeding acts of the Cortes. In May 1822, Dom Pedro accepted the dignity of constitutional emperor of Brazil, and a complete separation took place between the two countries. The constitution of Portugal was finally completed and sworn to by the king on the 1st of October 1822; and, shortly afterwards, the session of this extraordinary Cortes closed. A plot, however, was formed for abolishing the new constitution, at the head of which was the queen, a Spanish Infanta; and several of the nobility and clergy were likewise engaged in it. Dom Miguel violated the promise which he had solemnly given to his father by becoming the leader of the counter-revolutionists, and inviting the nation to rise under the royal standard against the anarchical policy of the Cortes. The greater part of the troops declared for the Infant, and John VI., yielding to the force of circumstances, named a new ministry, and declared the constitution of 1822 null and void. Sixty members of the Cortes protested against this proceeding; but the king, a mere puppet in the hands of his son, was borne along by the force of the current, without being able to give any effectual check to its course.

The object of the queen and the Infant was to induce the king to resume absolute power; but John VI. firmly declared his resolution not to comply. The counter-revolutionists, however, began to act independently of his authority, and various steps were taken to carry out their views. Dom Miguel being appointed commander-in-chief of the army, called the troops to arms, and issued proclamations, in which he declared it to be his intention to emancipate the king from the control of free-masons and others by whom he was surrounded. The ministers and other civil officers, to the number of one hundred persons, were on the same day put under arrest; but when the king ascertained what had occurred, he declared that the whole had been done without his orders. As an excuse for his conduct, the Infant said that he had taken these steps for the purpose of frustrating a conspiracy which had been formed against the king's life. On the representations of the foreign ambassadors, the individuals imprisoned were released; and the king issued a decree commanding an immediate investigation of the pretended treason. John, finding himself in danger of falling a victim to the intrigues of his son, contrived to escape on board of an English vessel which lay in the Tagus. He deprived the Infant of his command, but pardoned him and gave him permission to travel. Portugal and Brazil assumed a hostile attitude, but at length the independence of the latter country was acknowledged. This weak, good-natured monarch died in March 1826, having previously appointed his daughter Isabella regent of Portugal.

Isabella for a short time governed Portugal in the name of the emperor of Brazil, Dom Pedro, who was the legitimate successor to both the European and American possessions of the House of Braganza. On the 23d of April 1826 he granted a constitution to Portugal, which established two chambers, and in some other respects resembled the French charter. Not long afterwards, he surrendered Portugal to his daughter, Donna Maria, as an independent queen, on condition of her marrying her uncle, Dom Miguel. An unsuccessful attempt was then made by the absolutists to overthrow the constitution, and proclaim Dom Miguel absolute king of Portugal. In July 1827 Dom Miguel was appointed by his brother lieutenant and regent of the kingdom. The prince immediately returned to Portugal, having pledged himself to abide by the terms required by Pedro. He arrived in Lisbon in February 1828, and immediately assumed the administration of the government, at the same time taking the oath to maintain the constitution. But oaths were in his eyes a mere formality of state, involving no moral obligation. He assumed the sceptre as absolute king, and took his measures accordingly. But the military in general were unfavourable to his projects. The garrison of Oporto declared for Dom Pedro and the charter; other bodies of troops followed their example, and a corps of 6000 men advanced towards the capital; but they were defeated by a superior force, and the efforts of the constitutionalists were for the present baffled.

The object of Dom Miguel was now to consolidate his power, and get himself proclaimed king. The Cortes met, and all who were likely to oppose him having been imprisoned or exiled, this body unanimously declared Dom Miguel lawful king of Portugal. The pretext by which the Cortes endeavoured to vindicate its conduct was, that as Dom Pedro had become a foreigner, he had neither a right to succeed himself nor to appoint a successor. On the 4th of July 1828, Dom Miguel confirmed the decree of the Cortes, and assumed the title, as he had already done the powers, of royalty. The punishment of those implicated in the Oporto insurrection followed as a matter of course. An expedition was likewise sent against the refractory islands which had refused to acknowledge the usurper; and Madeira and the Azores were, with one exception, reduced.

In the meanwhile, Donna Maria had set sail from Brazil for Europe; but on arriving before Gibraltar, she found that, under actual circumstances, it would be injudicious, if not dangerous, to land at Lisbon, and accordingly steered for the English shores. She remained sometime in London, and during her stay was entertained as queen of Portugal. In August 1829 she returned to Brazil, in which a revolution suddenly deprived her father of his American empire. Having abdicated a crown which he could no longer retain, in favour of his infant son, the ex-emperor sailed for Europe with his daughter, to assert her claims to the throne of Portugal. The usurper still pursued the same course of oppression, and, not content with confining and despoiling his own countrymen, he extended his outrages to British and French subjects. In the year 1830 it was calculated that 40,000 individuals were under arrest for political causes alone; and that 5000 persons were concealed in hiding-places in different parts of the country. How many had been devoted to destruction by being sent to the fatal shores of Africa, and how many had voluntarily exiled themselves, it is impossible to estimate. The British government demanded redress for the acts of violence committed against its subjects, and on this being refused, a British fleet entered the Tagus, and terrified the tyrant into compliance. France acted in a similar manner, and with even more success, demanding an indemnity for the expenses incurred by the expedition. Even the United States despatched a fleet to Lisbon to obtain satisfaction for injuries done to American commerce. But these repeated humiliations wrought no change in the policy of Dom Miguel. But his finances were now falling into inextricable confusion. The revenue scarcely sufficing for the household expenses and the maintenance of the troops, the usurper was driven to all manner of expedients to relieve his necessities. The island of Terceira, one of the Azores, resisted his claims; and here a regency was formally installed, with the Marquis of Palmella at its head. From this spot Dom Pedro issued a decree in favour of his daughter Donna Maria.

Although neither the government of France nor that of England gave open assistance to Dom Pedro, both abstained from opposing any obstacles to his measures of recruiting. Many officers of each nation enlisted in his ranks; and towards the end of December 300 half-pay officers and volunteers sailed for Belleisle on the coast of France, which had been fixed upon as the place of rendezvous. Insurrections took place in Portugal, but were ultimately suppressed. Meanwhile the island of St Michael's was captured by a force from Terceira, under Villa Flor, one of the members of the regency. Afraid that Madeira would be the next object of attack, Dom Miguel sent a small armament for its defence. Dom Pedro now resolved to hazard a descent upon Portugal with the undisciplined troops he had collected together. The expedition sailed from the island of St Michael on the 27th of June 1832. It consisted of two frigates, three corvettes, three armed brigs, and four schooners, besides transports and a number of gun-boats, to cover the landing. An officer who held a commission in the British army undertook the command of the naval department, with the rank of admiral. The whole army on board did not amount to 10,000 men, scantily provided with artillery, and still more scantily with cavalry.

Dom Miguel made every preparation in his power to repulse the threatened attack. On the 8th of July Dom Pedro appeared before Oporto, landed his troops, and took possession of the town, without the loss of a single man. Miguel immediately menaced Oporto from two points. On the 22d of July an action took place, in which his troops were repulsed, and compelled to fall back.

The operations of the naval squadron were attended with little success. Several partial engagements took place between the two fleets, but no advantage was gained on either side. Dom Pedro continued to fortify Oporto; whilst Miguel, with equal industry, was increasing his army, the greater part of which lay on the north side of the Douro. The Miguelites made an attack upon a suburb of Oporto, which they carried; and the possession of this place enabled them to harrass the city greatly. Dom Miguel then made a general but unsuccessful assault upon the works with which Oporto was surrounded. Finding that it was impossible to carry Oporto by storm, Miguel determined to cut off the supplies. By this step Dom Pedro found himself reduced to great difficulties.

The contention continued through 1833. In this year Admiral Napier, then commanding Dom Pedro's fleet, utterly annihilated the enemy's in the neighbourhood of Cape St Vincent. Previously to this achievement, a body of queen's troops had landed at another point of the coast, and in a few days the whole of the Algarves declared for Donna Maria. This small army, under the command of Villa Flor, now Duke of Terceira, marched upon Lisbon, and on the way completely routed a greatly superior force. The capital was deserted by the garrison; the inhabitants rose *en masse*, and declared Donna Maria their lawful sovereign; and the Duke of Terceira, entering Lisbon in triumph, hoisted the queen's colours on the citadel. Dom Pedro instantly set sail from Oporto to assume the government, and no sooner had the intelligence reached France and England, than both immediately acknowledged Donna Maria as queen of Portugal.

Great preparations were made for the defence of Lisbon against the Miguelite army, 18,000 strong, which, under Marshal Bourmont, an experienced general, was now advancing towards the capital. Several attacks were made on the defences during the rest of the year 1833, but the results were unimportant. The first military operation of importance which took place in 1834 was the capture of Leiria, an important town between Lisbon and Coimbra, which capitulated to the queen's troops in February. A battle was lost by the Miguelites near Almoster, where Saldanha was posted; and towns and provinces began to declare for the queen so rapidly that the cause of the usurper became desperate. He shut himself up at Santarem, with a view of keeping up his communications with the frontiers of Spain, whence he expected aid. It was a singular coincidence, that in Spain as well as in Portugal, an infant queen was supporting her cause by favouring popular privileges, with an uncle for her rival, as a representative of more despotic principles of government. The cause of the two queens being so far the same, a community of interest led to an alliance, to which the courts of Britain and France became parties. Each was recognised as lawful successor to the throne to which she aspired, and they both agreed to employ their arms jointly against their two rivals. Don Carlos was compelled to fly from Spain into Portugal, and thither he was pursued by a Spanish army, which proved even more fatal to Dom Miguel than to Don Carlos. The Miguelites, seeing all hope lost, rapidly disbanded, and only the miserable remnant of an army remained attached to the usurper. A suspension of arms was agreed to; and on the 26th of May a convention was entered into, by which Miguel formally consented to abandon the country. The terms granted him were, that he should never again set foot either in Portugal or Spain, nor in any way concur in disturbing these kingdoms; that he should leave the country within fifteen days; that he should have a pension of about L.15,000, and be permitted to dispose of his personal property, after restoring the crown jewels and other articles; and, finally, that, by his command, the troops still adhering to his cause should instantly lay down their arms, and the fortresses surrender to the queen. On the 2d of June he embarked for Genoa, where he had no sooner arrived than he issued a declaration declaring that he had acted under compulsion in relinquishing the throne, and that the transaction was null and void.

The civil war being thus terminated, an extraordinary Cortes was assembled on the 14th of August. The regency was ultimately conferred on Dom Pedro, but he expired on the 22d of September 1834, having, during the latter years of his life, acted a part which the earlier stages of his career gave the world little reason to expect. The queen's marriage with the Duke of Leuchtenberg, the son of Eugene Beauharnois, and the brother of Dom Pedro's wife, was soon afterwards resolved upon. A bill to exclude Dom Miguel and his descendants from the throne of Portugal was passed without one dissentient voice. The budget for the year 1834 showed a considerable deficit, and this formed an excuse for treating the British auxiliaries, to whom they owed so much, with shameful ingratitude.

Prince Augustus of Leuchtenberg, the husband of the young queen, having arrived in Portugal in the beginning of the year 1835, was appointed commander-in-chief of the Portuguese army, a nomination which gave rise to much contention. But death soon cut short the discussion, for the young prince expired on the 28th of March. The chambers, however, did not allow the queen to indulge long in the sorrows of widowhood. The constitutional system depended greatly on a direct succession to the throne, and before the end of the year the queen's second marriage was arranged. The bridegroom selected was Prince Ferdinand of Saxe-Coburg, a nephew of the King of the Belgians.

The prince arrived at Lisbon in April 1836. Government now became extremely annoyed by the question, whether the king should be appointed to the command of the army, when it turned out that this was one of the special conditions of the marriage treaty. The proceeding proved very unpopular, and materially hastened a revolution, in which the ministry and the constitution were shipwrecked together. It does not appear, however, that the government anticipated any serious changes, as the country, although a good deal irritated, exhibited no dangerous symptoms of discontent. Yet the revolutionary plot must have been arranged beforehand, for even the troops of the line were seduced. The queen was compelled to declare the political constitution of the 23d of September 1822 to be in vigour; but it was at the same time agreed that it should undergo such modifications as circumstances had rendered necessary. A new ministry was immediately appointed, and Prince Ferdinand was deprived of his military commission. But neither the great body of the people nor the more influential classes showed any indications of accordance with the remodellers of government. Almost all the nobility, the superior clergy, and many persons holding official situations of greater or of less importance, refused peremptorily to take the oath to the new constitution. The peers, whose existence as a separate legislative assembly was thus abolished, protested to the queen against the measure. The queen, however, was obliged to accede to most of the demands of the liberal party, and thereupon dismissed her ministers.

The principal events which followed these changes were, the economizing of the expenditure, the imposition of a tax for the support of the priesthood, the introduction of a uniform system of duties on vessels sailing from Portuguese harbours, the abolition of the slave trade, and other measures of more or less moment. During the years 1837 and 1838 some provinces of Portugal were kept in constant terror, and, to a certain extent, ravaged by rebel banditti, whose ostensible object was to excite a rising in favour of Dom Miguel. The most noted of these guerilla chiefs, Remechido, was at length taken and shot.

To trace the tangled thread of Portuguese politics, to narrate all the changes of ministry, all the outbreaks of the people, during the last few years, would be tedious and uninteresting. It will be sufficient to mention the principal events. On the 4th April 1838, the nineteenth anniversary of the queen's birthday, she and her husband solemnly swore to maintain the new constitution; and an amnesty was granted towards all political offenders in respect of events that had taken place since the 10th September 1836. Viscount Sa de Bandeira was placed at the head of the new cabinet; and the general election of deputies was proceeded with. On the 31st October the queen was delivered of son, who received the title of Duke of Oporto, and is now the reigning king. During the year 1839 there were two changes of ministry: in the latter Costa Cabral came into power. Early in 1840 the Cortes were suddenly dissolved, and a new Cortes summoned to meet in May. As the year wore away disaffection showed itself in a part of the army, but the insurrectionary spirit was soon put down. About this time a quarrel broke out between the governments of Spain and Portugal as to the navigation of the Douro, which had been declared free to both nations throughout its course by a convention signed in 1835, leaving certain regulations to be settled afterwards. The Portuguese government appearing to hold back, that of Spain threatened to enforce the treaty *vi et armis*, whereupon the former gave way, and the dispute was adjusted.

In January 1842 Costa Cabral, who then held the portfolio of justice, suddenly left Lisbon for Oporto; and there, along with the military commander, proclaimed Dom Pedro's charter of 1826; forming, at the same time, a provisional government in the name of the queen, in the presence of the municipal authorities and the troops of the garrison. It was strongly suspected that the court connived with this proceeding; however the government compelled the queen to dismiss Cabral from his office, and to issue a proclamation against the insurrection. A new cabinet was formed, at the head of which was placed the Duke of Palmella; but the troops at Lisbon and the populace broke out into open revolt, demanding the restoration of the charter, whereupon the newly-appointed ministers resigned, and a royal decree issued proclaiming the charter to be the law of the land. Of the next cabinet the Duke of Terceira was nominal chief, and Costa Cabral came in as minister for home affairs. The Cortes met in July, and the queen told them, with reference to the charter, that their mission was to consolidate it. Matters went on pretty quietly until February 1844, when a regiment mutinied, and the insurrectionary spirit spreading, the Count de Bomfin put himself at the head of about 700 men, and retired to Almeida, where he was besieged by the government forces. The alleged object of the insurgents was to procure the dismissal of the ministers. They made, however, a feeble resistance: the place was surrendered, and the leaders allowed to escape into Spain. After the close of the session ministers did several arbitrary acts under the shelter of royal decrees, for which, however, they were afterwards indemnified by the Cortes. In April or May 1846, the standard of revolt was once more raised. The insurrection commenced in the Upper Minho, the immediate cause being, the imposition of a new tax. Great dissatisfaction with the ministry had existed throughout the nation for some time; the conduct of Costa Cabral especially had excited indignation and disgust, his rapacity and venality being notorious, and his increasing wealth evident. A great part of Portugal was up in arms, and the ministers resigned; whereupon a new ministry was formed, with the Duke of Palmella at its head, and the Marquis of Saldanha and the queen issued a proclamation promising a redress of grievances, including a restoration of the liberty of the press. Cabral (who had been ennobled the previous year by the title of Count Thomar) made his escape into Spain. A royal decree authorized the Bank of Portugal to suspend its cash payments. The Chamber of Deputies was dissolved, and the Cortes assembled for the ensuing 1st of September. At the commencement of October the queen abruptly dismissed her ministry, and at once entrusted Saldanha with the task of forming a new one. The suddenness of the proceeding, and the names of some of the ministers, led a large section of the nation to believe that the crown wished to replace the Cabralista party in power. A considerable body of troops revolted, and placed themselves under the leadership of the Conde das Antas and the Conde da Bomfin; whilst a revolutionary Junta was organized at Oporto. Affairs being in a very alarming position, the British government despatched a special agent to watch the proceedings, and endeavour to effect a reconciliation between the parties; and a British fleet was ordered into the Tagus. In the confusion that ensued, an attempt was made to excite a movement in favour of Dom Miguel, but this utterly failed. Cabral wished to return to Portugal, but the ministers prevented him; giving him, however, the appointment of ambassador at Madrid. On the 23d December an engagement took place at Torres Vedras between the queen's troops, under Saldanha, and the insurgents, under Bomfin, about 4000 men being engaged on each side. Bomfin was completely routed; 1300 of his men were taken prisoners along with the commanders, at a loss to the queen's army of nearly 400 killed and wounded. Saldanha (now a duke) then marched into the north, a small force having been stationed at Estremoz, in the east. He remained inactive for some time in the neighbourhood of Oporto, but being too weak to besiege or attack the place, the insurgents gathered strength and organized their plans. In April 1847, several steamers having fallen into the hands of the insurgents, about 1200 troops under Sa da Bandeira were transferred from the north to the south; where, being augmented by a body of the local militia, they marched in the direction of Lisbon. Troops under the Conde de Mello raised this portion of the insurgent army to about 4000. On the 1st May an engagement took place in the neighbourhood of St Ubes (Setubal), in which 500 of the ante-ministerial troops were killed or wounded. The capital meantime was only kept quiet by the threatening attitude of the British fleet. The queen felt her throne trembling under her, and preparations were made to receive her and the royal family on board a British man-of-war. The government having appealed to the governments of Britain, France, and Spain, active negotiations were set on foot to negotiate with the malcontents, and an amnesty for the past was offered; but the negotiations failed. There had been all along a strong disposition on the part of Spain to send a body of troops to the assistance of the queen. Spanish interference not being desirable for political reasons, it was at length arranged that the three governments should afford the queen the needful assistance; and a protocol was accordingly signed in London on the 21st May. The ministers had previously resigned, and a transition ministry appointed. An amnesty was issued, and the insurgents, seeing that the contest had become hopeless, laid down their arms, and Spanish troops occupied Oporto. The Cortes met, and new ministers were called to power. Through 1848 the country was quiet, Saldanha being at the head of affairs. In March 1849 Cabral had intrigued so successfully that he ousted Saldanha, and continued prime minister until April 1851, when Saldanha broke out into open revolt. He marched northwards with an inconsiderable body of troops, and followed the queen's husband at the head of a strong force. Saldanha denounced the peculations and continued infractions of the constitution committed by Cabral, and he called upon the queen to dismiss him from her counsels. At first Saldanha's movement did not receive much encouragement; at length the city of Oporto declared for him. Cabral resigned, taking refuge on board a British steamer; and Saldanha returned in triumph to Lisbon. He was placed at the head of a new ministry, which continued in power until June 1856. During this period the country remained quiet, but the ministry were guilty of a disgraceful act of bad faith towards the public creditors of the state. The finances for many years had been becoming worse and worse. The credit of the nation was very low, and the annual deficit large. Endeavouring by a vigorous effort to put the national affairs on a better footing, a royal decree, issued on the 18th December 1852, to reduce the rate of interest on the national debt, irrespective of the rate at which the money was borrowed, and without any offer of paying dissentient creditors in full. Large arrears of interest had been previously capitalized after deducting 10 per cent. of the amount. These dishonest acts were almost sufficient to justify the intervention of the British government, since a very large amount of the debt was owing to British subjects. The London Stock Exchange refused to allow any quotation of the funds in their lists; and this continued to be the case until 1856, when the Portuguese government came to an arrangement with its foreign creditors, of dubious advantage to them it is true, but the best that could be made under the circumstances.

Donna Maria died in childbirth on the 15th November 1853, whereupon the king-consort proclaimed himself regent until his eldest son should be of age. At the close of her troubled life she left behind five sons and two daughters. The eldest son quietly ascended the throne, with the title of Dom Pedro V., on the 16th September 1855, the anniversary of his eighteenth birthday. Little occurred during his minority that needs to be chronicled here, save that the deficient harvest of 1854 compelled the government to admit for a time foreign grain free of duty; and that the young king paid a visit to England and part of the Continent, accompanied by his next brother, in pursuance of a wish expressed by their mother. His majesty has lately married a German princess of the House of Hohenzollern. He is said to be of a reserved disposition; but he won golden opinions from the nation by his behaviour during a pestilence resembling yellow fever that carried off nearly 5000 persons at Lisbon in the autumn of 1857. The exciting cause of this fever was the poisonous atmosphere occasioned by defective drainage. Lisbon has long had the character of being the filthiest city in Europe; but if money can be procured, something is now to be done to amend this state of things. The Saldanha ministry having proposed to raise a sum of L.3,000,000, to make a grant to a French company of the right of constructing certain lines of railway, and to impose new taxes, their plans met with strong opposition in the lower chamber of the legislature. This, however, was surmounted; but a still more violent opposition was threatened in the chamber of peers; to avoid which the king was asked to create a number of new peers. As he refused to do this, the Saldanha ministry tendered their resignation in June 1856. The king then empowered the Marquis de Loulé to form a new government, which contented itself with asking for authority to contract a loan of L.330,000. This was given; and the arrangement with the British bond-holders was confirmed. An act was passed in the same session to abolish slavery in the Portuguese colonies on the west coast of Africa.

Here our sketch of the history of Portugal ceases. What the future of the country may be, it is not easy to foresee. The past affords a miserable story; the enormous debt must for a long period cripple the nation. The resources of the country are doubtless great, but they can only be developed by the enlightened and honest conduct of men in power, by a peaceful and law-respecting people, and by capital. This last requisite exists not at present in Portugal itself, nor can it be obtained from abroad as long as there are evidences of dishonest dealings or political disturbance. The conduct of the young king since his accession to the throne affords ground for good hopes, but great tact will be required to reconcile conflicting parties, as well as a firm determination to do justice to all, and to reign for the benefit of the whole body of the people.

List of the Sovereigns of Portugal.

I. *House of Burgundy.*

	A.D.
Henry of Burgundy	1095
Affonso I. (Enrique)	1112
Sancho I	1185
Affonso II. (the Fat)	1211
Sancho II. (Capel)	1223
Affonso III.	1248
Diniz (the Farmer)	1279
Affonso IV	1325
Peter (the Severe)	1357
Ferdinand I.	1367
A regency	1383

II. *House of Avis.*

John I. (the Great)	1385
Edward	1433
Affonso V. (the African)	1438
John II. (the Perfect)	1481
Manoel (the Fortunate)	1495
John III.	1521
Sebastian	1557
Henry (the Cardinal)	1578

III. *Interval of Submission to Spain.*

	A.D.
Philip II.	1580
Philip III.	1590
Philip IV.	1623

IV. *House of Bragança.*

John IV.	1640
Affonso VI.	1656
Peter II. (regent from 1667)	1683
John V.	1706
Joseph	1750
Mary I., and Peter III.	1777
Mary alone	1786
Regency	1792
John VI.	1816
Peter IV.	1826
Mary II.	1826
Miguel I.	1828
Mary II. (restored)	1833
Peter V., the present king	1853

Boundaries and extent.

Portugal, the most westerly kingdom of continental Europe, lies between 36. 56. and 42. 13. N. Lat., and between 6. 15. and 8. 55. W. Long. Its length from N. to S. is 310 geographical miles, and its extreme breadth is 132 miles. It has the figure of an irregular parallelogram, and its superficial extent is estimated at 35,400 square miles. On the N. and E. it is bounded by the Spanish provinces of Galicia, Leon, Estremadura, and Andalusia; on the S. and W. by the Atlantic Ocean, to which it presents a coast-line of nearly 500 miles in length, having only one province, Traz-os-Montes, not washed by the sea. On the N. the coast is low at first, but it afterwards becomes rugged and steep. In Beira it again gets flat, sandy, and marshy; in Estremadura it is in one part steep, and in another almost a dead level, and very insecure; in Alemtejo it is low, being full of rocks and shallows; and although at Cape St Vincent it is high and rocky, as we proceed towards the Spanish frontier the country sinks into low sandy downs. The promontories most worthy of notice are Mondego in Beira, Carvoeiro de Rocha and Espichel in Estremadura, Sines in Alemtejo and San Vicente, and Santa Maria in Algarve. On the low coasts there are inlets of the sea, which afford opportunities for the formation of excellent harbours.

Mountains. Portugal is not separated from Spain by any natural boundaries, and hence in all its physical relations it is to be considered as a westerly continuation of that country. The principal chains of mountains are prolongations of those which traverse Spain. In the N., between the Minho and Douro, the country is intersected in various directions by the southerly and westerly procession of the Galician and Austrian mountain ranges, which terminate at the sea in a steep and broken coast. The provinces situated in this quarter are alternating mountain and high tableland, a continuation of the lofty table-land of Old Castile and Leon. The Serra de Montezinho, near the northern frontier, is a lofty range, on the summit of which snow lies for many months of the year; and indeed the peak of Gaviarra, 7850 feet, which forms part of the Serra de Suajo, is said to be crowned with perpetual snow. This range runs between the rivers Lima and Minho, terminating at the sea under the name of the Serra d'Estrica. On the left bank of the Lima extends the Serra de Gerez, a branch of the last-mentioned range, and declining towards the lower Douro, receives the name of the Serra de Sant Catarina. The highest point of this range attains the altitude of 7360 feet. In the province of Traz-os-Montes is also the Serra de Marão, on the left bank of the Tamega, and stretching down almost to the Douro. To the E. of it is the plateau of Guardo, between 2000 and 3000 feet in height, and which on the N.E. is bounded by the Serra de Montezinho. In the province of Beira, between the rivers Mondego and Zezere, extends the Serra d'Estrella, a continuation of a chain which traverses Leon and Castile. The mountain ridge consists of granite and layers of sandstone. It presents a shattered and savage aspect, is covered with snow during the greater portion of the year, and in its ramifications incloses the river Mondego. Its highest summits are those of Cantaro Delgado and the Malao da Serra. Northwards it declines gently towards the Vouga, and stretches in a westerly direction to the gates of Coimbra, under the name of the Serra de Alcoba. The southerly branch runs through the province of Estremadura, to the mouth of the Tagus, forming the granite mountains of Cintra, which terminate in the sea at the Cabo de Roca (Rock of Lisbon). To the S. of the mouth of the Tagus stretches the Serra d'Arabida, an inferior range. Between the Tagus and the Guadiana the country is elevated, but gradually sinking towards the Spanish province of Estremadura, is bounded on the S. by a continuation of the Sierra Morena of Spain, which mountain chain is here penetrated by the river Guadiana. The Serra de Caldeirao, which afterwards bears the name of the Serra de Monchique, a ramification of the gigantic Sierra Morena, extends in a westerly direction to the sea, where it terminates in Cape St Vincent, and completely incloses Algarve. Its loftiest peaks are Foya (3840 feet) and Picota (3720 feet), near the western extremity of the chain. From this account it will be seen that Portugal is a land of mountains intersected by valleys, many of which contain scenery of great beauty. There are, however, two plains of some extent; one to the S. of the Tagus, of which that of Santarem forms a continuation, and one at the mouth of the Vouga.

Rivers. Portugal receives its principal rivers from Spain. The largest are the Tagus, the Guadiana, the Douro, the Lima, and the Minho. The Tagus originates in the Sierra d'Albaracin, on the borders of Cuença and Aragon, flows at first in a northerly direction, and then turns to the S., but during the most part of its course its general bearing is westerly. After traversing several Spanish provinces, it enters the Portuguese territory near the point where it receives the Sever, separates the provinces of Beira and Alemtejo, and after dividing Portuguese Estremadura into two unequal parts, falls into the Atlantic. It receives the waters collected between two parallel ranges of mountains, flows through a mountainous country, and its current is much broken by rocks and cataracts. Its waters are turbid, and annually overflow and fertilize the extensive plains in the environs of Santarem and Villa Franca. Lower down it forms many marshes of considerable extent, which yield a large revenue. The length of its course is 450 miles. It is affected by the tide a considerable distance above Lisbon, but it is only navigable to Abrantes. Its width is so great near its mouth as to make it resemble a vast lake or arm of the sea; and at Lisbon it forms one of the finest and safest harbours in the world. The tributaries which it receives on the N. are the Elga, the Ponsal, and the Zezere; and those from the S. are the Sever, the Sorraya, erroneously called Zatas in most maps, and the Canha; but none of these are navigable. The rivers worthy of notice which have their source in Portugal are the Cavado, Ave, Vouga, Mondego, Sado, Odemira, Portimão, and Rio Quarteira. The Cavado rises in the Serra de Gerez, and after traversing the province of Minho, discharges itself near Esposenda, being only navigable for 7 miles. The Vouga has its source in Beira, and after traversing this province, enters the ocean below Aveira. The Mondego issues in the Estrella, crosses Beira and the plains of Coimbra, and finally joins the ocean near Figueira and Buareos. This is the largest of the rivers belonging exclusively to Portugal, and it is navigable for 60 miles, except in summer, when its waters considerably diminish. Its sands occasionally yield particles of gold. The Sado has its source in Alemtejo in the Serra de Monchique, and flows with a north-westerly course towards Estremadura. It becomes navigable from Porto de Rey, and enters the ocean by a large bay to the S. of Setubal. The same serra gives rise to the Odemeira and Portimão, the former being navigable to the town of the same name, and the latter as far up as Silves. The Rio Quarteira has its source in the Serra de Caldeirão, and forms at its mouth the small port which bears its name. These rivers, when swollen by the winter rains, overflow their banks, much to the advantage of the country, for the waters leave a rich deposit behind them. In summer they are very low, and many of the smaller rivers of Portugal are dried up during that season. They are in general much obstructed by rocks and bars of sand at their mouths, by which navigation is greatly impeded.

Lakes and springs. Portugal possesses no navigable canals worthy of notice. On the coast, especially in Alemtejo and Beira, there are morasses, lakes, and inferior inland seas, none of them being of great circumference. Several mountain lakes on the Serra d'Estrella are tepid, and throw up bubbles. Portugal is rich in medicinal springs, some of which are used for baths. They consist of gaseous and saline mineral waters, and of sulphureous and chalybeate springs. Thirty-four hot springs are known to exist, and lead to the supposition that volcanic action is still proceeding below the whole country. The most celebrated sulphur and warm baths are the Caldas de Gerez in Minho, those of Rainha and Oeiras in Estremadura, those of Chaves and Anciaes in Traz-os-

Montes, of San Pedro do Sul and Penagarcia in Beira, and of Monchique in Algarve. The best chalybeates are at Torro de Moncorvo in Traz-os-Montes, those of Amaranha and Guimaraens in Minho, and of Villas in Estremadura.

Geology. More than half Spanish Galicia—that is to say, all the western and middle parts of the province—consists of granite, gneiss, mica, schist, and other crystalline rocks; the eastern side being chiefly formed of slate, graywacke, &c., which probably belong to the Silurian and Devonian formations. The mean strike of the slates is about N.N.W. Small patches of secondary red sandstones, and marls of unascertained age, are scattered over the province; whilst now and then a small tertiary deposit occurs; and the bottoms of many valleys contain thick deposits of gravel. The same formations are found in the N. of Portugal. Great part of Minho and the western side of Traz-os-Montes are formed chiefly of crystalline rocks; but the rest of the latter province consists of slates, continuous with those in the E. of Galicia. The crystalline rocks extend, with some interruptions of slate and other rocks towards the S. or S.S.E., in a band of 40 or 50 miles wide, through the whole extent of Portugal, from the province of Minho to the Guadiana. The great mountainous districts of the Serra d'Estrella are included in their range. The granites gradually slope away from the Atlantic, and approach the Spanish frontier; while the slates on their eastern flank slope into Spain. The wine district of the Upper Douro is formed of slate rocks belonging to the Silurian system, being of precisely the same mineral type as those of France and Spain, and including the same fossils. These rise up in highly-inclined and vertical strata, and are nearly surrounded by granitic and syenitic mountains. They are quarried for roofing-slates. In this district is the coal-field of Vallongo, which supplies Oporto with anthracite coal, and geologists with a difficult puzzle. By mineral structure and fossil remains it belongs to the carboniferous era, and yet it is seen to dip under lower Silurian schists with their characteristic fossils. Murchison's explanation of the anomaly is, that the trough containing coal of true carboniferous date, deposited upon Silurian strata, has been dislocated and changed by subterranean movements, so that the original relative position of the beds has been inverted. The great granitic band is flanked on its western side by slaty and schistose rocks. The schists run S.E. from the mouth of the Vouga, keeping on the N. of the river; then turning southward, they run along the Serra de Busaco, pass about 4 miles to the E. of Coimbra, and continue along the small river Deuça; and then down the lower part of the Zezere to the Tagus near Abrantes. The district lying between the schists alluded to and the Atlantic is composed of sandstones of undetermined age, at the base above which are a series of Jurassic beds, a subcretaceous series, and a hippuritic limestone which is equivalent to our chalk. Southward of Abrantes is a great tertiary basin, with an area of between 2000 and 3000 square miles, through which the Tagus and the Sado cut their way to the sea. Lisbon stands in this basin. The most important part of this series is marine, belonging to the miocene period; but there occur some beds of lacustrine limestone. The upper part of this tertiary basin forms a marshy district, consisting probably of quite modern lacustrine and fluviatile deposits. To the N. of Lisbon, basalt, covering a considerable area, sharply separates the secondary and tertiary deposits. To the S. of that basin secondary beds make their appearance in the middle of Alemtejo, and these are probably older than those on the N. of the Tagus. On the S. is a lofty chain of hills, separating Alemtejo from Algarve, and consisting of schists and slates. A little granite, however, occurs at the Cabeça de Monchique. Schists are met with along part of the Alemtejo coast, and syenite at the Cape of Sines. In Algarve a band of secondary rocks lies to the S. of the schistose chain, and these are overlaid by tertiary deposits on the S. coast. Trap has burst forth near Cape St Vincent. Very little is known as to the geology of Portugal, except in regard to the neighbourhood of Lisbon and Oporto. The reader is referred, for further information, to Mr D. Sharpe's Memoirs in the *Transactions of the Geological Society* for 1841; and to the *Journal of the Geological Society*, vols. v. vi. and ix.

Mines. Tin mines appear to have been wrought by the Carthaginians in this part of the Peninsula; and it is affirmed that mines of tin-stone existed in some granitic mountains of Beira. Mines of gold and silver were wrought in this country by the Romans. There are lead mines near Coimbra, a mine of plumbago near Mogadouro, and iron mines near Figueira and Torre de Moncorvo. In Estremadura there are two very old establishments of the same kind, one in the district of Thomar, and the other in that of Figuero dos Vinhos. On the frontier of that province, and of its neighbour Beira, are situated the mines of red oxide of iron by which they are supplied. Iron indeed is one of the most abundant minerals in the country. There is a mine of antimony near Oporto, and the mountains in that neighbourhood everywhere give indications of copper and other ores. All the mines, however, are worked to a very small extent: the mineral riches of the country are great, but capital and enterprise are required to turn them to account. In Portugal there are also mines of tin, mercury, bismuth, and arsenic. Some of the rivers of this country, as well as those of Spain, are washed for the gold which they contain; and it is said that in this way large quantities of the precious metal were formerly collected. The river Tagus was anciently celebrated for the particles of gold which were found mingled with its sands; but its greatest riches are now borne on its bosom. Indeed, none of the streams yields a quantity worth much above the labour of collecting it. There is only one gold-mine in Portugal, situated in a place called Adissa, in the district of Setubal; but its annual produce is a mere trifle, not reaching 20 lb. weight at an average. Two coal-mines exist: one near Figueira, and the other near Oporto; but the coal is of inferior quality, and large importations consequently are made from England. The country abounds with beautiful marbles, but they are comparatively little wrought, from the expenses required to bring them to market. Precious stones are found in Portugal, and also quarries of limestone, gypsum, slate, freestone, millstone, black agate, together with immense beds of pyrites and marcasites, potter's and porcelain clay, and pits of common salt. In 1853, 60,000,000 bushels of salt were produced, of which about seven-twelfths were exported.

Climate and soil. Various causes conspire to produce great differences in the climate of Portugal in different situations, such as inequality of soil, vicinity to the ocean and to mountain ranges, &c. The mountain chains in the northern part of the country are very rugged and cold, the limits of perpetual snow being in this latitude under 8000 feet. This cold region comprises a considerable portion of the provinces of Traz-os-Montes and Beira, and the whole of the northern frontiers of Minho. The sea-coast of Portugal is very warm, the heat of summer, however, being tempered by the sea-breezes. The elevated plains and mountains are sterile, and destitute of wood; but the valleys and other low situations have a mild and agreeable climate, and are for the most part fruitful. A great part of Minho possesses a delightful climate. Estremadura, on the other hand, is very hot in summer and very cold in winter; but the high lands throughout the whole southern portion of Portugal have an agreeable temperature, equally removed from excessive heat in summer and severe cold in winter. Algarve alone has an African climate, but the excessive heat is greatly tempered by the sea-breezes. The warmer parts of Portugal have a short winter and a double spring. The first, which commences in February, is a delightful season. The succeeding months are variable, being in some years hot and dry, and in others cold and rainy. Harvest is gathered in June. Summer commences in the last week of July, and continues till the beginning of September. The heat is then very great, parching up all the vegetation on the plains and sea-coast, so that it is necessary to water plants to preserve them from destruction. Rain begins to fall early in October, and the vegetation of spring immediately succeeds to that of autumn. Winter lasts from the end of November till February, but the cold is seldom excessive, except in very elevated situations. In December heavy rains descend, accompanied by strong winds; it is during this period that the rivers are so liable to overflow their banks. The climate of Portugal, in general, may be pronounced salubrious, particularly along the coasts and on the tablelands. Fevers of various kinds appear to be the diseases most prevalent, but there are disorders peculiar to different localities. In many districts, in the country around Lisbon for instance, earthquakes are not unfrequently felt in harvest and winter. Portugal is rarely visited by violent storms, and thunder is seldom heard except during autumn and winter.

Animals.

Birds are not numerous; vultures and the gray eagle haunt some of the serras, and the red-legged partridge is common. Of wolves, wild cats, wild goats, wild boars, stags, and some other species of large game, there are a few in certain localities. Hares are rare, and rabbits are not so numerous as in Spain. Amphibious reptiles are not common, but vipers and venomous serpents abound in the mountains; the other parts of the country, however, appear to be free from them. There are several species of lizards. The rivers are amply stocked with fish, and the coasts literally swarm with them; but the fisheries are much neglected, and large quantities of salted fish are imported.

Flora.

The indigenous flora is very much the same as that of the rest of the Peninsula. Besides the British species of elm, ash, maple, sycamore, poplar, alder, hazel, and arbutus, there are found species of oak, willow, rhamnus, juniper, and heath, which are not indigenous in our islands, in addition to the species that are. Amongst the oaks, the cork-tree and the kermes oak may be noticed. Here grow also the bay tree, Portugal laurel, Spanish chestnut, two species of Pistacia, three species of Phillyrea, the sumach, carob-tree, *Celtis australis*, *Pinus maritima*, and *P. pinea*. The myrtle, pomegranate, rosemary, lavender, liquorice-plant, as well as *Viburnum Tinus*, *Daphne Gnidium*, *Smilax mauritanica*. Thirty species of Cistus, and many members of the genera Genista, Spartium, and Cytisus, are natives. In the south large plains are covered by *Cistus ladaniferus*, with patches of the dwarf-palm (*Chamærops humilis*). Amongst the filices it is curious that *Davallia canariensis*, a fern only found elsewhere in the Atlantic islands, should grow at Cintra and the neighbourhood of Oporto. Turning to plants which have been introduced, we may mention that, at the latter place, the camellia flourishes in the open air; whilst at Lisbon there grow, unprotected in gardens, the date-palm, the dragon-tree, coral-trees, acacias, and *Phytolacca dioica*. The *Agave americana* has become wild; and this is the case in the extreme south of Portugal with a cactus, the castor-oil plant, and the oleander. Groves of fruitful orange trees and fields of rice also attest the mildness of the climate; and, contrasted with the alpine plants on the mountains of the north, give some idea of its range. Much needs to be done to work out the flora of Portugal, for scarcely anything has been published respecting it since Brotero's *Flora Lusitanica*, which appeared in 1804. In Algarve the carob-tree and fig-tree yield fruits that are not only consumed on the spot, but are largely exported. From the fruit of the arbutus a spirit is extracted; almonds are produced in considerable quantities. The leaves of the dwarf-palm are applied to many useful purposes; and the grass known as Esparto (*Stipa tenacissima*, L.) is made into nets and cordage. There are large forests of Spanish chestnut on the mountains, but the kermes of the *Quercus coccifera* is no longer gathered, its use having been superseded by cochineal. A cactus (*Opuntia*) yields a fruit on the lower grounds which is much esteemed on the spot.

Population

According to the census of 1854, the population of the several provinces of Portugal was as follows:—

	Area in sq. miles.	Population.
Entre Minho e Douro	3,144	851,266
Traz-os-Montes	4,044	314,524
Beira	8,712	1,155,275
Estremadura	7,284	730,629
Alemtejo	10,056	301,062
Algarve	2,160	146,363
Total	35,400	3,499,121

The cities and towns having more than 10,000 inhabitants are—

Lisbon	275,000	Coimbra	15,000
Oporto	90,000	Elvas	12,000
Setubal	17,000	Ovar	12,000
Braga	16,000	Evara	10,000

Government.

The government, once one of the most absolute kind, is now a limited monarchy, altered by an additional act dated 5th July 1852. The existing constitution bears date the 29th April 1826. The crown is hereditary, and may be worn by females as well as males. The person of the monarch is irresponsible. There are two legislative chambers,—that of the peers and that of the deputies,—which are conjunctively named the General Cortes. The peers are named for life by the crown, by whom the president and vice-president are nominated. The deputies are chosen by direct election; the electors must be of full age, and possessed of a yearly revenue of about L.22. The deputies must have an annual income of about L.89, but no property qualification is necessary in the case of the graduates of a learned profession. The number of electoral districts in continental Portugal is 37, and the number of deputies is 133. The deputies elected in Madeira, Azores, and the colonies, amount to 25. Each deputy has a remuneration of about 10s. a day during the session. The annual session lasts three months, and a fresh election must take place at the end of four years. In case of a dissolution a new Cortes must be called together within thirty days. The chamber of peers consists of about 115 members, but the crown has the power of appointing new peers without limit. A peer does not necessarily bear a title; and, in fact, many peers are without titles, as many of those who have been ennobled have no seat in the chamber. There are seven ministers of state, one for each of the departments of the interior, finance, justice, and ecclesiastical affairs; public works, commerce, and industry; naval affairs and the colonies; war and foreign affairs. The deliberations of these ministers, who form, as we would say, "the cabinet," are held in the presence of the president of the council, who is considered the prime minister. Several of the ministers are assisted by administrative boards: for instance, there is a board of public instruction under the minister of the interior.

Knights, royal titles, &c.

There are six orders of knighthood in Portugal, viz.:—The military order of Christ, established in 1319; the order of San Thiago of the sword, founded in 1288; the order of Avis, for military merit, established in 1213; the military order of the Tower and Sword, founded in 1459, and revived in 1805–8; the order of Our Lady of the

Immaculate Conception of Villa Viçosa, for civil merit, founded in 1818; and the female order of Santa Isabel, established in 1804. In 1749 the King of Portugal received from Benedict XIV. the title of *rex fidelissimus;* and his Most Faithful Majesty styles himself "King of Portugal and Algarve, of both sides of the sea in Africa, Lord of Guinea, and of the navigation, conquests, and commerce of Æthiopia, Arabia, Persia, and India." The heir to the throne is styled Prince-Royal; his eldest son Prince of Beira; the other royal children are called Infants and Infantas of Portugal. The present Braganza line of princes commenced with John IV., who was proclaimed king in 1640. The national escutcheon is a silver shield, with five smaller blue shields lying crossways. On each of these are five silver pennies, placed so as to form a St Andrew's cross. There is a red border containing the armorial bearings of Algarve, which are seven golden castles with blue towers. The number of royal palaces, and that of the nobility, are in inverse proportion to the extent and wealth of the kingdom. Of the former there are eleven; and as to the latter there are, according to the *Almanach de Portugal* for 1856, no fewer than 7 dukes, 21 marquises, 79 counts, 102 viscounts, and 106 barons.

Finances.

The finances have been in a bad state for many years. The debt is rapidly increasing, the income being never equal to the expenditure. The national credit has fallen very low, and the nation is greatly impoverished; a state of things which internal troubles, breaches of contract with creditors, unprincipled dealings, and financial blunders, have contributed to form in their several degrees. The public debt was in 1855, L.21,384,538; an enormous amount for so poor a country, the interest of which presses grievously upon the springs of industry. The national revenues arise from—1. Direct imposts; 2. Customs and indirect imposts; 3. Rents and profits of national property. From the first class, consisting of a land-tax, income-tax, percentage on land sold, stamps, &c., there was produced in 1856 about L.650,000. From the second class, which includes the produce of the tobacco and soap monopoly, there was raised about L.1,384,000; and from the third, which includes the profits of the post-office, about L.140,000 was obtained. Besides these sums, L.118,000 was raised chiefly by the sale of national property. The budget for 1858–9 was:—Income, L.2,553,100; expenditure, L.2,894,790; deficit, L.341,690; two-thirds of which it was proposed to make up by various retrenchments and reductions of salaries. The king and royal family receive endowments amounting to L.131,000. The members of the Cortes receive L.17,000. In the budget for 1856–7, the following sums were allotted to the ministers for the expenditure of their several departments:—Finance (in addition to the allowances above mentioned, and to the interest on the national debt), L.160,000; home affairs, L.260,000; justice and ecclesiastical affairs, L.100,000; war, L.64,000; marine, L.186,000; foreign affairs, L.33,000; public works, commerce, and industry (including railways, roads, and post-office), L.231,000.

Justice.

For the administration of justice, continental Portugal is divided into 105 *comarcas*, in each of which there is a judge called *juiz de direito*, the highest judicial authority in the district. From his decision there is an appeal to one of the two superior courts of appeal sitting at Lisbon and Oporto. These judges must not remain more than six years at the same place, and are never appointed to exercise their functions in the district in which they were born. To the court of each *juiz de direito* is attached a public prosecutor, who is appointed by the crown, like the judge himself. Inferior to the *juiz de direito* are three classes of judges, exercising jurisdiction within narrower limits, appointed by the people; they serve two years, and are named *juizes ordinarios, juizes electos*, and *juizes de paz*. Criminals are tried before a jury composed of twelve persons, except in thinly-populated districts, where nine persons may form a jury. Their verdict needs not to be unanimous; it is sufficient if two-thirds are agreed. In civil cases the parties may agree to dispense with a jury, and this is very frequently done, in which case their functions are exercised by the judge. The course of law in civil matters is tedious and expensive; in criminal proceedings the accused frequently lies many months in jail before being brought to trial. The functions of police magistrates are exercised by an officer called *administrador*, appointed by the crown in each *concelho* or district of a municipal chamber.

Army and navy.

The strength of the army for the economic year 1855–6 was fixed by law at 24,000 men of all arms, exclusive of the municipal guards. On the 1st of January 1855 the army actually comprised—infantry, 15,217; cavalry, 2394; artillery, 1563; and engineers, 334. In addition to these there was a militia amounting to 5000 men. The engineers consist of one battallion, the artillery of three regiments, the cavalry of eight regiments, the infantry of eighteen regiments, besides nine battalions of riflemen. Connected with the army are the royal military college at Mafra, the polytechnic school, and the military school, both at Lisbon. Continental Portugal is divided into eight military divisions; the Madeiras and Azores forming two more. At the head of the entire army is the commander-in-chief, who is by law bound to obey the orders of the crown, signified through the secretary of state for war.

The naval force for the same year was fixed by law at 2383 men, distributed amongst one man-of-war, one frigate, three corvettes, four brigs, seven schooners and cutters, and six steamers. Official documents exhibit the fleet as consisting of twenty-six armed sailing-vessels, nine disarmed, four under construction, five armed steamers, and one disarmed, the whole carrying 449 guns. The orders of the crown are communicated to naval officers through the secretary of state for naval affairs.

Clergy and ecclesiastical affairs.

Continental Portugal is divided into three provinces,—viz., Braga, Lisbon, and Evora. Under the Archbishop of Braga, who has the title of primate, are six bishops; under the Patriarch of Lisbon (who is always a cardinal), are five bishops; and in addition the bishops of Augro (Azores), Funchal (Madeira), Cape Verde, St Thomas, and Angola. Under the Archbishop of Evora are three bishops. This hierarchy divides about L.21,300 amongst them. Goa in India is the seat of an archbishop, who has under him seven bishops and a prelate. The number of parishes in continental Portugal is 3769. The conventual establishments were suppressed in 1834, and their property taken by the state. At that time there existed in Portugal 632 monasteries and 118 nunneries, the two classes having 18,000 inhabitants. A few convents, however, are still permitted to exist, but their inmates are in a state of great poverty, and the buildings are gradually falling to ruin. The lower ranks of the priesthood throughout Portugal are poorly educated and badly paid. Roman Catholicism is the religion of the state, but all other forms are tolerated; and there are Protestant chapels at Lisbon and Oporto.

Public instruction.

The affairs relating to public instruction are under the management of the superior council of education, the nominal head of which is the secretary of state for the home department. This council holds its sittings at Coimbra. In Portugal the school is entirely separated from the control of the church; a remarkable fact in a Roman Catholic country. By a law enacted in 1844 it is compulsory on parents to send their children to a place of public instruction, but this law is far from being enforced, and only a very small fraction of the full number really attends a school. There is only one university in the kingdom, that of Coim-

Statistics.

bra, founded in 1290. This has five faculties and forty-six professors and lecturers, who are attended by between 800 and 900 students. In 1854 there were 1136 schools devoted to primary instruction in the kingdom, attended by 33,500 scholars of both sexes, of whom only 1570 were females. The lyceums, which constituted the division of secondary instruction, were 182 in number, and the pupils were 2860. Into the section of superior instruction fall the polytechnic academies and medico-chirurgical schools of Lisbon and Oporto, besides the university of Coimbra; into that of special instruction fall the academies of fine arts at Lisbon and Oporto, and the royal conservatorio of Lisbon for music, declamation, and dancing. As to the education of the clergy, six dioceses have seminaries, and eight have halls of theology. There is a royal military college at Mafra, an army school, a navy school, and a veterinary school at Lisbon. In the building of the extinct monastery of Belem, about 900 orphan and abandoned children of both sexes are supported, educated, and taught various useful arts. Two educational institutions recently established by government at Lisbon are likely, if properly worked out, to be attended with great benefit to the nation. These are the agricultural institute and the industrial school. The first is a college where instruction on the scientific treatment of the soil, cattle, &c., is imparted. In the year 1854–5 eighty pupils matriculated. The second is an institution where various useful arts are taught, as well as the elements of mathematical and physical science. In November 1855 the pupils amounted to 458. There is also an agricultural institute at Oporto. Lisbon has two botanical gardens; Oporto and Coimbra each one. These three cities have likewise observatories, public museums and libraries, and printing establishments. At Lisbon is a national printing establishment supported by the state; but recourse is had to a foreign country when neatly-printed books are required.

Agriculture.

Portugal is behind almost every nation of Europe in agriculture; and improvements are here very slowly introduced. The soil is neither manured nor tilled as it ought to be. The plough is composed of three pieces of wood awkwardly fastened together, and imperfectly aided by wheels. The districts best cultivated are the valleys of the Minho, the Upper Douro, and some portions of Traz-os-Montes and Beira. The total want of roads, and internal circumstances, present a very great check to every kind of production, and to native industry generally. Not one half of the area of Portugal is cultivated, and that in a very insufficient manner. Until lately grain was imported; it is now only beginning to be exported; and yet grain is a staple production, like oil and wine. Finer wheat, finer grapes, finer olives, can nowhere be produced; yet the wheaten bread is not good, the oil is inferior, and proper care is not taken in making the wines. Farmsteads, such as we are acquainted with in England, do not exist. The small occupants keep a few pigs, a goat, and poultry; but the rearing of swine, sheep, and cattle, is almost exclusively confined to the wealthier proprietors of extensive unreclaimed lands at the extremes of the kingdom, or in the vicinity of the Spanish frontier. The cattle in the north are small but fine, many of them having been reared on the fertile pastures of Galicia, and smuggled across the Minho. The southern breed is of great size, and is particularly well adapted for drawing the rude carts of very ancient form, the wheels and axles of which turn round together. The breed of pigs is not good; but as droves usually feed on acorns and chestnuts, the pork and hams are much esteemed. The best breed of sheep is reared on the frontier of Spain; but the mutton is generally very poor. The flocks of the Alemtejo yield the best wool. Milch cows are rare, butter being imported. Cheese is made on the mountains from the milk of sheep and goats; but in the cities the cheese consumed is imported. The milk consumed is chiefly that of goats. The general bread of the people is made from maize, for the cultivation of which grain the climate and soil are well adapted. The straw affords sustenance through the winter to the draught oxen. Rice is grown to a considerable extent in marshy districts in the south. The vegetables chiefly cultivated are beans, gourds, cabbages, onions, garlic, and potatoes. Chestnuts are a considerable item in the food of the people. Beer is almost unknown, wine taking its place. The horses are principally imported from Spain; but the native breed of mules is fine. The quantities of agricultural produce used as food, raised in 1855, were these:—Wheat, 938,100 quarters; maize, 1,714,200 quarters; rye, 651,900 quarters; barley, 271,400 quarters; 68,100 quarters; kidney-beans, 104,700 quarters. Hemp and flax are extensively grown. The average annual production of olive oil may be given at 28,000 pipes; and of this quantity, between 6000 and 8000 pipes are annually exported. Oranges, almonds, figs, and carob-tree fruit are grown and exported. In 1853 the sheep are calculated to have numbered two and a-half millions; the wool produced amounted to nearly four millions of pounds, and the raw silk to 315,000 pounds. Cork bark to the amount of 61,500 cwt. was exported in 1853.

The vine.

Four modes of cultivating the vine are adopted in Portugal,—1*st*, The vine is trained upon pollard or low trees, after the manner in use by the ancients Romans. 2*d*, In the valley of the Douro the vines are planted on terraces, and are not allowed to be higher than about 4 feet. The branches are tied to stakes as the fruit ripens, so that the grape is at least 8 inches above the ground. This is the mode generally adopted in the port wine district, where the ground is turned three times a year by hand labour, it not being possible to use the plough. 3*d*, The vines are planted in rows about 8 feet apart, with the view of admitting the plough between them. The plants are kept low, and resemble gooseberry bushes. 4*th*, In gardens near towns the vines are supported on trellises at a height of 8 or 10 feet above the ground, walks and arbours being formed beneath. In the wine district of the Douro, when the grapes are cut, they are conveyed in baskets to the press, which resembles a large stone trough. The white grapes are separated from the dark ones, but of the latter all varieties are thrown together, to make the wine we know as *port*. The grapes are then trodden by the feet of labourers stepping to the sound of some musical instrument; and when the first gang is tired, another takes its place. The operation is continued for about thirty-six hours. The grapes being fully crushed, fermentation commences in the "must;" and this is allowed to proceed for a longer or shorter time, according to the quality of the grape and the kind of wine proposed to be made. A "must" deficient in saccharine matter becomes wine in a much shorter time than one in which that matter is abundant. To produce a rich wine, the fermentation is checked, and brandy is added; to produce a dry wine, the fermentation is permitted to run its natural course, and only a small quantity of brandy is thrown in. Many varieties of grape are in cultivation, and the wines produced are very numerous. From the Douro district, a mountainous tract about 40 miles from Oporto, we derive port wine. The district within the control of the Oporto Wine Company produced in favourable years about 105,000 pipes; but the production for the last year or two has scarcely been one-fourth of this. A large tract of soil is devoted to the vine beyond this district; but the wine is consumed in the country. Comparatively little of the wine produced on the banks of the Tagus, known in this country as Lisbon wine, comes to England, the chief part of the exportations being taken to Brazil. Buccellas is the best known of these wines. The number of pipes of

Portuguese wine annually exported previously to the appearance of the vine disease was about 60,000, more than one-third of which was taken by Britain, and about one-half by Brazil. The average total quantity of wine annually produced amounted to about 650,000 pipes. In 1853 about 16,500 pipes of brandy were produced.

Manufactures.

The manufactures of the kingdom are of little importance, except in the coarsest fabrics. Not more than about 20,000 persons are employed in manufactures, and all the finest fabrics are imported. Small arms are made at Lisbon and Oporto; porcelain, after foreign designs, at Vista-alegre; cotton goods at Lisbon, Oporto, and Thomar; gold and silver work, iron and tin wares, at the same places; steam-engines and general foundry-work are made at Lisbon and Oporto; pottery, stearine candles, and fine soap are made at Lisbon, where there are sugar-refineries, distilleries, tanneries, &c. There are woollen manufactories at Lisbon, Port-alegre, Covilhão, and Tondão; glass manufactories at Marinha Grande, Terra de Feira, and Vista-alegre. Silk is manufactured in the Algarve; paper at Tojal and Alemquer. That Portugal is advancing, is shown by the increasing use of steam-power and machinery in manufactories, oil-mills, corn-mills, &c.

Trade and commerce.

The foreign trade of the country has been much reduced by the separation of Brazil and political disturbances. The chief articles of exportation are wine, oil, salt, wool, fruits, cork-bark. The chief importations consist of the finer fabrics of silk, cotton, linen, and wool; coals, metal-work, metal ores, tar, pitch, drugs, salt fish, butter, and cheese. Heavy duties are imposed on many manufactured fabrics, and a good deal of smuggling is the consequence. For this reason, and the additional reason, that many goods were imported for the purpose of being smuggled into Spain, where still higher duties were imposed, the official returns are little to be relied on. In 1854 the total value of the imports was, according to official returns, about L.4,044,600; and the total value of exports amounted to L.3,147,500. The following table gives the particulars of imports and exports for that year:—

	Imports.	Exports.
Cotton and cotton goods	L.880,000	L.154,440
Linen goods	124,500	23,110
Woollen goods	237,500	31,150
Silk goods	62,140	14,660
Fats and fatty goods	144,800	45,330
Animals	43,480	53,330
Animal products	127,000	70,660
Fish	148,880	26,660
Colonial produce	419,100	13,330
Grain	100,350	381,220
Wine, spirits, and fermented liquors	8,880	1,460,440
Fruits, seeds, and plants	8,440	248,410
Woods	150,440	87,550
Crockery and glass	29,900	5,700
Metal goods	1,093,550	348,000
Minerals, coal, &c.	973,440	17,770
Paper	27,110	8,440
Chemicals and drugs	153,110	139,330

The extent of the trade between Great Britain and Portugal may be judged of from official returns relating to the year 1854. In that year we received from Portugal produce to the amount of L.2,102,000, and we sent to her foreign and colonial produce to the amount of L.150,000, and home produce to the amount of L.1,370,600; there entered British ports during that year 195 Portuguese vessels with cargo; whilst in the preceding year 558 laden British vessels entered Portuguese ports. In 1854 Great Britain took from Portugal 22,800 pipes of wine; and in 1855, 52,000 qrs. of grain (principally wheat), and 10,430 cwt. of flour. Brazil is the next best customer of Portugal. In 1853 Brazil received from her goods amounting to L.580,000; and sent her produce of the value of L.190,000. There is also commercial intercourse between Portugal and the United States of America, France, Spain, Russia, Sweden, and Norway.

At Lisbon there are two joint-stock banks, and at Oporto one. At these two cities there are several insurance offices, and public companies for working mines, carrying on manufactories, &c. The nominal amount of capital embarked in public companies at the commencement of 1855 was, however, no more than L.3,326,000. The manufactures of tobacco and soap form government monopolies, and are farmed out to companies, whose articles are much complained of. The cities of Lisbon, Oporto, and Coimbra are lighted with gas manufactured by companies. At the two former places many English have settled, who are chiefly engaged in the wine trade.

Portugal is connected with England, France, the Mediterranean ports, and Brazil, by regular lines of steamers. Small steamers also connect Oporto, Lisbon, and ports in the Algarve. The Portuguese government is endeavouring to establish a line of steamers for connecting the Azores with Lisbon, and another line for connecting their West African possessions with the mother-country. In 1852 the ships, boats, &c., of continental Portugal numbered 671, with a tonnage of 71,400, manned by 7387 persons.

Several railroads have been projected, but the only one completed is a line of 22 miles connecting Lisbon with Carregado. Telegraphic lines, worked by electricity, have been established between Lisbon and the Spanish frontier, and Lisbon and Oporto.

The post-office is in the hands of government. The rate of postage has lately been reduced; and a letter not exceeding a quarter of an ounce is now carried any distance within the kingdom for 1¼d., which is paid by a stamp, on our own plan.

Coinage.

The coinage is on the decimal system, and accounts are kept in *reis*, 4500 of which are equal to the pound sterling. The chief silver coins are the *testao* = 100 reis, the *crusado novo* = 486 reis, and the *mil-rei*, or dollar = 1000 reis. There are gold coins of 4800 reis (the *moeda*, or moidore), 5000 reis, and 8000 reis.

Colonies.

The AZORES and the MADEIRAS (see these articles) are termed adjacent isles, and are not considered colonies. The Portuguese exercise sovereignty over the islands of Cape Verde, the islands of Principe, S. Thomé, and Anno Bom, off the African coast, near the equator; have possessions on the Guinea coast; and lay claim to a great region on the west coast of Africa, south of the line known as Angola and Benguela. The area of the country claimed by them in this part amounts to 153,000 square geographical miles, and the inhabitants are said to number 53,000, chiefly Negroes. On the east coast of Africa the Portuguese claim the territory of Mozambique, extending from the Bay of Lourenço Marques, in Lat. 26. S., to Cabo Delgado, in Lat. 10. S. The area is calculated at 216,000 square geographical miles, and the population at 300,000. In Hindustan the Portuguese have settlements at Goa, with a subject population of 350,000; a strip of land at Damão, in the Gulf of Cambay, with 34,000 inhabitants; and the fort of Diu, in Gujerat, with a piece of land inhabited by 11,000 persons. In China, Portugal claims nine square miles at Macao, with a population of 4600. She also claims the islands of Timor and Solor, lying between Australia and Java. These are said to have a population of 92,000.

Language and literature.

The language, like the Italian, may be described as a soft bastard Latin, for the majority of Portuguese words are derived from that tongue. It has a close affinity to the Spanish; so much so, that Spaniards and Portuguese can understand each other; and yet considerable differences have been produced by the separation of the two kingdoms through a long course of years, and by the efforts of the Portuguese themselves, who have always desired to make their language diverge as much as possible from their neighbours. The Spanish tongue is more dignified, stately, and rich; the Portuguese more concise, soft, and fluent, with more conversational aptitude. In the latter tongue is embodied a large number of Teutonic and Arabic words; of words of eastern origin, chiefly Arabic, a list of 1400 has been made out. It has no guttural sounds, but possesses many strongly-marked nasal endings, chiefly *em*, *ão* (formerly written *am*), and *ãa*. *J* and *x* are soft, not guttural, as in Spanish; *ch* is also soft, as in French, not hard, as in Spanish; *h* is silent except in the middle of a word, when it has the liquid sound of *y*; *c* before *e* and *i* is soft, before the other vowels hard, unless marked with the cedilla. Adjectives change their terminal *o* into *a* for the feminine; *s* is the sign of the plural in nouns; and the infinitive mood of verbs ends in *r*. The language is easily acquired by foreigners. The best modern dictionary is F. S. Constancio's *Novo Diccionario Critico e Etymologico da Lingua Portuguesa*, Paris, 1836; its etymological explanations, however, are frequently unsatisfactory.

Literature. The literature of Portugal, almost ignored by the rest of Europe, contains, it must be admitted, no masterpieces, with the exception of *Os Lusiadas* of Camoens; and this poem is much oftener mentioned than read out of Portugal. It has, however, been translated into most European languages, there being no fewer than three into English. The language, lending itself readily to verse, poetry forms a disproportionately large section of the literature; and of this section love poems form the great bulk. Several early kings and members of the royal family composed verses, and thereby gave fashion to the occupation. In the fifteenth century romantic pastorals, the most artificial of all poetical compositions, came into vogue, and this class of poetry has ever since been much cultivated. At the close of the fifteenth century appeared Bernardino Riberio, one of the best of the early poets; and a little later the much-esteemed poems of Sãa de Miranda saw the light, many of them, however, being written in the Castilian language. Camoen's great poem was first printed in 1572. Amongst modern poets the name of Almeida Garrett, only recently dead, is conspicuous. The first classical prose work is a romance entitled *Corte na Aldea*, by Rodriguez Lobo, published towards the close of the sixteenth century; and at the same period the works of Cortereal, another classic writer, saw the light. In the seventeenth century appeared several works of travel, one of which, Mendes Pinto's *Perigrinaçam* (1620), has been translated into most European languages, and has acquired a distinguished reputation for want of veracity. In one of Congreve's plays, a dealer in fictions is thus addressed,—"Mendes Pinto was but a type of thee, thou liar of the first magnitude!"

In the department of history the writers are numerous. The national conquests in the sixteenth century are a favourite theme; and here the *Decads* of Barros (1553), the Livy of the Portuguese, are conspicuous. In the next century Andrade's *Life of Don João de Castro*, fourth viceroy of the Indies, is considered a masterpiece of biographical composition. Almost the only complete history of the kingdom by a native writer is the *Historia de Portugal*, by Lemos, 1786–1804, 20 vols. A valuable history of the kingdom is, however, in progress, and promises, by its critical spirit and elegant style, to form a classical work. We allude to the History of Alexandre Herculano, the royal librarian, of which four volumes have appeared. In a nation which has always boasted of its adherence to Romanism, it is only to be expected that theological and ecclesiastical writings should be numerous, and a glance at any library will show that such is the case. We shall content ourselves, however, with referring to Diniz's *Das Ordens religiosas em Portugal*, 1853.

As to pieces for the theatre, the early dramas of Antonio Ferreira, Camoens, and Gil Vicente, the Plautus of Portugal, were original; then came imitations of the Spanish writers; and of late years the French stage has been the main support of the Portuguese drama. The best comedy in the language is thought by the Portuguese themselves to be the Countess Vimieiro's *Osmia*, which was crowned by the Academy. It is founded on an event in their early history.

In the department of fiction the Portuguese of the present time rely chiefly on importations or translations from other nations, chiefly the French. With regard to periodical literature, there are between forty and fifty newspapers published in the capital, and in the principal towns; they are all of small size, and their circulation is very limited. The leading articles read like translations from the French applied to Portuguese topics. Those who wish to learn more of the literature of Portugal may consult Sismondi's *History of the Literature of the South of Europe*.

Fine arts. In this department Portugal presents us with no name of eminence, with the exception of an old painter who is known as the Gran Vasco, and who in that country takes the rank that Raffaelle takes in the rest of Europe. The events of his life are unknown; the year, even the century of his birth, is a matter of dispute; and all that can be said with certainty is, that he was born either in the fifteenth or sixteenth centuries. A vast number of pictures in different parts of the country are attributed to him, the majority, no doubt, quite erroneously. The best collection of his works is said to be found in the cathedral of Viseu. The wealthier class of Portugal seems to have little taste for the fine arts; a few of the nobility, however, possess small collections. The national collection is deposited in the convent of St Francisco (at present the Academy of Fine Arts) at Lisbon; but not more than half-a-dozen pictures of real value are to be found in it. Exhibitions of the works of living artists occasionally take place here.

The following works may be consulted by those desirous of learning fuller particulars on the subject of Portugal:—Forrester's *Prize Essay on Portugal*, second edition, 1854; *Portugal und Seine Colonien*, von Dr Minutoli, 1855; Murray's *Handbook for Travellers in Portugal*, 1855; and the *Boletin do Ministerio das Obras Publicas*, an official work published at intervals. (J. Y. J.)

PORTUMNA, a market-town of Ireland, in the county of Galway, at the head of Lough Derg, 39 miles S.E. of Galway, and 94 W.S.W. of Dublin. Though at one time a place of some importance, it is now but a poor town There are here a fine parish church in the perpendicular style, with a lofty spire; a Roman Catholic church, court-house, national school, dispensary, workhouse, and jail. The ruins of Portumna castle, and of an old monastery, are also to be seen here. Tobacco is manufactured; and there is some trade. Six fairs are held annually. (Pop. (1851) 1542.

PORTUS, ÆMILIUS, an accomplished Greek critic, was the son of the eminent philosopher Francis Portus, and was born at Ferrara about 1550. Like his father before him, he devoted his life to the promotion of polite learning. From 1581 to 1592, his time was occupied with the duties of Greek professor at Lausanne. He then discharged the same office at the university of Heidelberg. Meanwhile his mind, down to the time of his death in 1610, was also occupied with the composition of commentaries, translations, and original works, all bearing upon his favourite study. He published editions of the *Iliad*, Euripides, Pindar, Aristophanes, Thucydides, and Xenophon. He translated into Latin the *De Theologia Platonis* of Proclus, the *Lexicon* of Suidas, the *History* of Thucydides, and the *Roman Antiquities* of Dionysius of Halicarnassus. At the same time, he gave to the public the following works:—*Oratio de Variarum Linguarum Usu*, 4to, Cassel, 1611; *Dictiona-*

rium Ionicum, 8vo, Frankfort, 1603; *Dictionarium Doricum*, 8vo, Frankfort, 1604; *Pindaricum Lexicon*, 8vo, Hanau, 1604; *De Prisca Græcorum Compotatione*, 8vo, Heidelberg, 1604; and *De nihili Antiquitate et multiplici Potestate*, 4to, Cassel, 1609.

Portus, *Francis*, an eminent philologer, was born in the isle of Candia in 1511, and received his education at Padua. The classical attainments which he now showed were destined to be matured by a long and varied experience as a teacher. He began life by holding for some time the directorship of the school for young Greeks at Venice. He then occupied, for the space of six years, the chair of Grecian literature at Modena. His next post was that of tutor to the sons of the Duchess Renée of France, who was then living at Ferrara. At length, in 1562, he was found at Geneva, a refugee on account of his adherence to Protestant opinions, and the professor of Greek in the university of that city. It was about this time that Francis Portus became known as a philological writer. He published commentaries and annotations upon Pindar, some of the works of Xenophon, Thucydides, Aristotle's *Rhetoric*, Longinus, and some other writers. After his death in 1581, his posthumous works were published by his son Æmilius, in 4to, 1584.

PORUS, an Indian prince who was conquered by Alexander the Great. (See Macedonia.)

POSEIDON. See Neptune.

POSEN, a province of Prussia, lying between N. Lat. 51. 10. and 53. 32., E. Long. 15. 7. and 18. 30.; and bounded on the N. by the province of West Prussia, W. by that of Brandenburg, S. by that of Silesia, and E. by the Russian empire; area 11,348 square miles. The surface is almost entirely level, and large portions of it are occupied by lakes and marshes. The principal rivers are the Warthe and the Netze, both taking their rise in Poland, and flowing westwards,—the former through the middle and south of the province into the Oder, and the latter through the north, and falling into the Warthe. The principal affluents of the Warthe that join it in this province are the Prosna and the Obra, both from the left. The Oder just touches the province at one point on the extreme S.W., and the Vistula washes it for a short distance on the N.E. frontier, and receives here the Brahe, which is connected by the Bromberg Canal with the Netze. The Warthe is navigable all through the province, and the Netze as far as Nackel, where the Bromberg Canal meets it. Of the lakes in Posen, the largest is that of Goplo, on the Polish frontier, which is 10 square miles in extent. The most important marsh is that from which the Obra takes its rise. The soil is in general very fertile, especially on the banks of the Warthe: in other places it is of a sandy nature, and not so good. The minerals found here, consisting of iron, building-stone, saltpetre, &c., are of no great importance. All the ordinary kinds of agricultural produce may be raised; and this is one of the provinces in Prussia most productive of corn. Posen contained, in 1852, 3,649,807 acres of arable land, 515,516 of meadows, 1,348,389 of forests, and 1,144,932 of waste land. Besides corn there are raised here potatoes, pulse, hops, tobacco, hemp, flax, &c. Timber is obtained in large quantities from the forests, and forms an article of export of some importance. The province contained, in 1855, 153,442 horses, 868 asses, 481,418 horned cattle, 2,199,977 sheep, 13,749 goats, and 163,258 pigs. Poultry and bees are also kept, and fish are obtained from the rivers. Manufactures are not carried on here to any great extent. The most important establishments are 303 breweries, 257 distilleries, 13 tanneries, besides manufactories of woollen cloth, cotton, and linen. A considerable trade is carried on in the export of manufactured articles, as well as of corn, timber, cattle, wool, hides, tallow, honey, wax, &c. Education is not in such a good state in Posen as in other parts of the monarchy. It contains, however, 14 gymnasia, with 188 teachers and 4207 scholars; 3 normal seminaries, with 175 pupils; 36 middle schools, attended by 2702, and 1984 public elementary schools, by 212,152 scholars. This province at one time formed part of the kingdom of Poland; but at the first partition in 1772 Prussia obtained all the country north of the Netze, and at the second partition in 1793 all the rest of the present province. An insurrection of the Poles against Prussia took place in this province in 1848; but after suffering several defeats, the insurgents were dispersed, and their leaders apprehended. In the same year, certain portions of Posen, inhabited chiefly by Germans, were incorporated with the German Confederacy; but in October 1851 these were again separated by a treaty. Besides Germans, Posen is inhabited by Poles and Jews, both of which races are more numerous here than in any other part of the kingdom,—the former amounting to about 930,000, and the latter to 74,031 in 1851. In that year there were 447,986 Protestants and 870,574 Roman Catholics in the province. It is divided into the governments of Posen and Bromberg. Pop. (1855) 1,392,636.

Posen (Pol. *Poznan*), the capital of the above province, a strongly-fortified town on both sides of the Warthe, 149 miles E. by S. of Berlin. It is pretty well and regularly built, and is entered by four gates. In the middle of a large market-place stands the town-hall, a Gothic building of the sixteenth century, with a tower erected in 1730, which is the highest in Posen. In the interior there are some curious sculptures, and statues of several Polish kings. Another large and splendid square, the Wilhelmsplatz, contains the theatre and the public library of 26,000 volumes,—the latter occupying a building erected in 1836, with a portico of twenty-four Corinthian columns in front. In the suburb of Wallischei, which lies on the right bank of the river, and is connected with the rest of the town by a wooden and a stone bridge, stands the cathedral, a building of no great pretensions, but containing several ancient monuments,—among the rest that of the Woywoda Gurka and those of the bishops of Posen. The Golden Chapel, added to the main building in 1842, is a richly-decorated specimen of the Byzantine style. The church of St Stanislas is a beautiful building in the Italian style. Numerous other churches, a synagogue, and several convents, are contained in the town. The former Jesuits' college is now used as a government-house. Posen contains two gymnasia, a Roman Catholic normal seminary, and several other educational and charitable institutions. The town was made a fortress of the first rank by the erection in 1828 of Fort Winiary. It stands on a hill to the north of the town, of which, as well as of the hilly and well-watered country round about, it commands a fine view. The manufactures of Posen are numerous, consisting of linen and woollen cloth, chintz, calico, leather, tobacco, sealing-wax, carriages, &c. An active trade is carried on; there are two wool markets, and three much-frequented annual fairs. Posen is said to have been, next to Gnesen, the most ancient city of Poland, and the residence and place of burial of the dukes and kings of that country. It was originally built only on the right bank of the Warthe; but in 1250 that part which lies on the other side was founded. All the finest parts of the town have risen since Posen became a part of Prussia. Pop. (1852) 44,039.

POSIDONIUS, a distinguished Stoic philosopher, was a native of Apameia in Syria, and was the pupil of Panætius and cotemporary of Pompey and Cicero. He was probably born about 135 B.C.; but the date of his birth is not known with exactness. On the death of Panætius at Athens, Posidonius set out on his travels, and first visited Spain. Having collected a variety of information on points of geography and natural history, he next visited Italy, Sicily, Dalmatia, Illyricum, Massilia, Gallia Narbonensis, and Liguria, and fixed his abode at Rhodes. Here he became president of the Stoic school, and took a prominent part in the political affairs of the republic. He was sent on an embassy to Rome, B.C. 86, when he became personally acquainted with Marius. Cicero and Pompey both visited him at Rhodes; and he is reported to have gained much geographical and historical knowledge from the latter. In B.C. 51 Posidonius removed to Rome, where he soon after died. As a physical investigator he was greatly superior to the generality of the Stoics, attaching himself in this respect more to Aristotle. He was a man of very extensive information on almost all departments of human knowledge, and particularly of astronomy and geography. He calculated the diameter of the earth, the distance of the sun and its magnitude, and the influence of the moon on the tides. Of the writings of Posidonius there were in all about twenty-five, none of which has come down to us entire. The relics of his writings have been carefully collected and illustrated by Janus Bake, in a work called *Posidonii Rodii Reliquiæ Doctrinæ*, Lugd. Batav. 1810. (Fabric. *Bibl. Græc.*, vol. iii.; Ritter, *Gesch. der Philosophie*, vol. iii.; Smith's *Dictionary of Greek and Roman Biog. and Myth.*)

PÖSING, a town of Hungary, in the county of Pressburg, on a small affluent of the Danube, 12 miles N.E. of Pressburg. It has a castle, churches, a monastery, and a synagogue. There are here celebrated mineral baths. Paper, saltpetre, and other articles are manufactured. In the vicinity granite is quarried; and vines are extensively grown. Some trade in timber is carried on. Pop. 4950.

POSITIVISM, or "*Positive Philosophy*," is the name given to that new philosophy inaugurated by the late Auguste Comte, and which is to be found developed both in principle and in details in his *Cours de Philosophie Positive*, 6 vols., Paris, 1830–42. It lays claim to present a doctrine which is *positive*, because elaborated from the sciences, and yet possessing all the desired generality of metaphysical doctrines. It puts aside as futile all inquiry into causes and essences, and restricts itself to the observation and classification of those *laws* which regulate all phenomena. Comte advances three initial conceptions, two of which relate to method, one to history.

The first conception is, that philosophy and science are identical; that every science, of whatever kind, is but a branch of the positive philosophy; consequently, that one method must be followed in all investigations, whether they relate to physics, to psychology, to ethics, or to politics.

The second conception is, that of classification, whereby this philosophy resolves itself into five fundamental sciences, of which the succession is determined by a necessary subordination, founded on a comparison of corresponding phenomena, the simpler being studied first, are converted into instruments for the better prosecution of those which succeed. Thus mathematics becomes the instrument of astronomy and physics; chemistry becomes the instrument of biology, and biology the instrument of sociology. There are two classes of phenomena to be signalized,—*inorganic physics* and *organic physics*. In inorganic physics we separate the general phenomena of the universe from the less general terrestrial phenomena, and obtain thereby *celestial physics*, or *astronomy*, and *terrestrial physics*. Astronomy, as the most general and simple in its phenomena, demands the first place in our studies. Terrestrial physics is divided into the two classes of *physics* proper and *chemistry*. Organic physics requires a similar division into *biology* and *sociology*, as the phenomena relating to mankind are more complex than those relating to the individual man.

The third conception refers to the fundamental law of evolution. Humanity has three stages of development,—the theological, the metaphysical, and the positive. In the history of individuals, in the history of nations, we find that speculation originates with supernatural explanations, advances to metaphysical, and finally rests in positive explanations. In the theological state, man is disposed to regard all effects as supernatural, as so many signs of the pleasure or displeasure of some being or beings adored and propitiated as a God. The lowest condition of this stage is Fetishism, the highest is Theism. The metaphysical stage, which is properly but a modification of the Theological, is equally important as the Transitive stage. In it the supernatural agents give place to abstract forces, supposed to inhere in the bosom of substances, and capable of producing phenomena. In the Positive stage the mind, convinced of the folly of inquiring into causes and essences, applies itself to the discovery of those laws which regulate effects. It tries to discover those invariable relations of succession and similitude which exist throughout nature. The pretension to absolute knowledge is disavowed, since everything beyond the senses is futile. The discovery of laws becomes the great aim of mankind.

Such is a brief view of the positive philosophy, possessing great merits and very great defects. The attempts of the author to found a social doctrine and a new religion will not tend to smooth down what is harsh in his philosophy.

Positivism finds an advocate in George H. Lewes. See his chapter on "Auguste Comte," in his *History of Philosophy*. He has likewise written a volume to expound it, entitled Comte's *Philosophy of the Sciences*, 1853. Harriet Martineau has given us a condensed translation of the *Cours de Philosophie Positive*.

POSSESSIVE. See GRAMMAR.

PÖSSNECK, a walled town of Saxe-Meiningen, Hildburghausen, in the principality of Saalfeld, on the Kerschau, 11 miles E.N.E. of Saalfeld. It is an active manufacturing town, producing cloth, leather and porcelain. Pop. 4200.

POST, a word derived from the Latin *positus*, set or placed. It is used in several different meanings, but all of them referring either immediately or remotely to this primitive sense of *position*. Thus the word *post* signifies a stake, or piece of timber set upright; a station, particularly a military station; an office or employment; an operation in book-keeping; a conveyance for letters or despatches; a particular mode of travelling.

POSTERN, in fortification, a small gate usually made in the angle of the flank of a bastion, or in that of the curtain, or near the orillon, and descending into the ditch, by which the garrison can march in and out unperceived by the enemy, either to relieve the works or to make sallies. The word is also used in general for any small door or gate.

POSTH (Lat. *post*, after; It. *postilla*; Sp. *postila*), a name anciently given to a note in the margin of the Bible, and afterwards to one in any other book posterior to the text.

POSTLIMINIUM, amongst the Romans, the return of one who had gone to sojourn elsewhere, or had been banished or taken by an enemy, to his own country or state.

POST-OFFICE.

Introduction.

It has been usual to trace the origin of posts to a remote antiquity, certain establishments, having something in common with the modern post system, being found to have existed at an early period of the world's history. Herodotus and Xenophon mention that, among the ancient Persians, stations were appointed at intervals along the great roads of the empire, where couriers were constantly kept in readiness to bear despatches and intelligence. Similar institutions, as we learn from Suetonius, were maintained amongst the Romans in the time of Augustus, and some such probably existed much earlier. But although the *name* of the *post* may be traced to this source (from the Latin word *positus*, whether as applied to the accommodation and means of transport *placed* at intervals for the service of the couriers, or to the couriers themselves, placed or *posted* at the several stations), such institutions obviously bear but a vague resemblance to the post-office of the present times. The couriers were mere State messengers, the communication only to and from the seat of government; nor, so far as appears, was there any regular machinery for the receipt and delivery of letters, so essential to the idea of a modern post establishment. The posts which were first instituted in the kingdoms of modern Europe, as those by Charlemagne and Louis XI. of France, the Emperor Charles V., and some other sovereigns, differed little, if at all, from those now described. It is indeed probable, that whenever the posts or couriers were appointed to perform their journeys at stated periods (which, as soon as the occasions for employing them became frequent, would be found at once the most economical and effective mode), such a convenient means of conveying correspondence, though primarily intended only for State purposes, would soon come to be used by individuals. Houses of call for the receipt and delivery of letters would in process of time be established by custom, if not by regular appointment; and in this way the modern post system might grow up. The earlier posts instituted in Europe, however, were in general but of temporary duration; their existence being dependent sometimes on occasion, sometimes on the disposition or policy of particular monarchs. In our own country, the insular position of which made our sovereigns less anxious about intelligence from their frontier, nothing of the nature of a public post establishment can be proved to have existed (or with an immaterial exception in the reign of Edward IV.) till that after the modern form was introduced; to explain the rise of which, however, is matter of no difficulty. The conveyance of letters, indeed, is what must inevitably become, in the course of human transactions, as much matter of necessity, as the conveyance of persons or of commodities; and the same circumstances which generate the formation of roads and bridges, and give existence to the trade or occupation of carrier, shipmaster, or innkeeper, must necessarily lead to the employment of the post messenger, under greater or less degrees of system and regularity. History, more attentive to record the transactions of monarchs than the steps by which communities effect their advancement and improve their conveniences, furnishes little beyond an incidental notice of the modes by which the circulation of correspondence was conducted before it became matter of State regulation. The conveyance and delivery of letters was often part of the usual occupation of travelling pedlars and others, whose business led them to perform stated or frequent journeys. When commerce began to advance, regular conveyances for correspondence were established between some of the principal trading cities, either by the municipal authorities, or by concert of private individuals or associations.

British Post-Office.

A permanent establishment of messengers for the conveyance of letters was attached to the university of Paris from the beginning of the thirteenth century, and indeed was not abolished until the year 1719, long after a general post had been settled in France. Other universities were similarly provided. In some instances powerful and opulent individuals established posts, either as a mercantile speculation, or for the convenience of any district in the prosperity of which they took an interest. But although the conveyance of correspondence was thus brought to some degree of system, or rather prevailed under a variety of systems, even in places where the State authorities had not yet provided any public establishment for this purpose, it is easy to see that communication, especially between distant places, must have been slow, irregular, and insecure. The advantage and even necessity of having a uniform and legalized system of post conveyance could not have failed to present itself to the eyes both of subjects and rulers; although it may be a question whether the sovereigns who first established such systems in their dominions were in general moved so much by large and enlightened views of public benefit, as by the wish to create, according to the practice so usual in that age, a lucrative trading monopoly in behalf of some of their favourites.

The establishment of the modern post system, then, in some of the principal countries of Europe, is not properly to be viewed as of the nature of a political or civil invention, being merely the assumption, on the part of the State, of the conduct of a particular department of human affairs which had grown up with the progress of society, but was now fast outgrowing the means and appliances of private enterprise, and presenting tempting possibilities of aggrandisement to official persons. Everywhere the transmission of letters, and more especially of government despatches, was at first connected with the furtherance of ordinary travel; and (as we shall see hereafter) in many parts of Europe the connection still continues. Our historical review begins at home. After narrating the successive proceedings which have gradually made the British post-office the best in the world, we shall describe its existing regulations and mechanism. It will then remain to give such account of the postal systems of other countries as our limitations may permit.

I. HISTORY OF THE BRITISH POST-OFFICE.

History of the British post-office.

As early as the middle of the thirteenth century, entries occur in the wardrobe accounts of the kings of England of payments to royal messengers for the conveyance of letters to various parts of the country. In entries of the same year (*e.g.*, 1252) these messengers are variously designated. Sometimes the term used is *cokinus*, sometimes *nuncius* or *garcio*. The same three words occur, half a century later, in the wardrobe accounts of Edward I., two of them being employed in the title of the chapter relating to such payments,—*Titulus de Expensis Nunciorum et Cokinorum Regis Edwardi filii Regis Henrici*, &c. In the supervision of these royal messengers lies the germ of the office of postmaster-general.

The first of such officers of whom we can give a distinct account is Sir Brian Tuke, who is described in the records as *Magister Nunciorum, Cursorum, sive Postarum*, "both in England and in other parts of the king's dominions beyond the seas." Thomas Cromwell wrote to him, in August 1533, complaining of "great default in conveyance

Postal system in England under Henry VIII.

of letters," and signifying the king's pleasure "that posts be better appointed." Tuke, in reply, assures the secretary that the cause of the mischief is the insufficiency of the sums assigned for the payment of men and horses. "The king's grace," he writes, "hathe no moo ordinary postes, ne of many days hathe had, but bitwene London and Calais; and they in no wages, save the post of London in 12d., and Calais 4d., by day; but riding by the journey, whereof most part passe not two in a moneth; and sens October last the postes northewarde, every one at 12d. by day. Thise in wages be bound but to on horse, which is inough for that wages, albeit some of them have moo. I never used other ordre, but to charge the towneshippes to lay and appoint such a post, as they wol answer for." After some other explanations, the postmaster-general proceeds thus:—"Sir, ye knowe well that, except the hakney horses bitwene Gravesende and Dovour, there is no such usual conveyance in post for men in this realme as is in the accustumed places of France and other partes; *ne men can kepe horses in redynes withoute som way to bere the charges, but when placardes be sent for such cause, the constables many tymes be fayn to take horses oute of plowes and cartes, wherein can be no extreme diligence.* But, sir, not taking upon me to excuse the postes, I wol advertise you that I have knowen in tymes past folkes whiche, for their owne thanke, have dated their letters a day or two more before they were writen, and the conveyers have had the blame." In 1545 Sir Brian Tuke was succeeded by Sir William Paget and John Mason, Esq., as joint postmasters-general, under letters-patent, which grant the office to them during their lives and the life of the survivor, under the same designation as that borne by Sir Brian Tuke, "together with the wages of L.66, 13s. 4d. a year," in addition to the expenses incurred in the conveyance of letters, of which accounts were rendered from time to time.

But long subsequent to this appointment of a postmaster-general, the details of the service were frequently regulated by proclamations and by orders in council. Thus, in the curious collection of royal proclamations in the library of the Society of Antiquaries, there is one of Philip and Mary (undated, but apparently of 1555), which regulates the supply of horses for the conveyance of letters to Dover. Again, in July 1556, the Lords of the Council order "that the postes betweene this and the Northe should eche of them keepe a booke, and make entrye of every lettre that he shall receive, the tyme of the deliverie thereof unto his hands, with the parties names that shall bring it unto him." Sir John Mason was succeeded in 1567 by Thomas Randolph, and he by Sir John Stanhope (afterwards Lord Stanhope of Harrington) in 1591.

Regulation of the English post-office in 1591.

In the year last named appeared "A Proclamation for redresse of disorders in postes which convey and bring to and out of the parts beyond the seas packets of letters." It recites previous attempts to redress such disorders, and "particularly to prevent the inconveniences, both to our own service and the lawfull trade of honest merchants, by prohibiting that no persons whatsoever should take upon them, publicly or privately, to procure, . . . bring in, or carry out, any packets or letters to or from the countries beyond the seas, except such our ordinary posts and messengers for those parts as, either by our master of the posts, or the masters of the posts-general of those countries reciprocally, should be found nominated for that kind of service." This prohibition is renewed in more stringent terms, and command is given to all mayors, sheriffs, justices, officers of customs, and officers of the post, "to make diligent search of all mails, budgets, and other carriages of all such disavowed carriers, messengers, or suspected persons, . . . and all such so discovered to apprehend and stay."

Postal arrangements in Scotland; and in Great Britain after accession of James I.

The accession of James I. to the English throne, by necessitating a more frequent communication between London and Scotland, led to some improvements in the postal service. Some years earlier, special posts had been established by the magistrates of some Scottish towns for the conveyance of their despatches to and from the court. Thus, in 1590, a messenger was appointed by the magistrates of Aberdeen with the title of "council post," and with a dress of blue cloth bearing the town arms.[1] The new royal orders of 1603, "for thorow posts and carriers riding in post in our affaires," direct (1.) that "in all places where posts are laid for the packet, they also . . . shall have the benefit and pre-eminence of letting . . . of horses to all riding in post (that is to say) with horn and guide, by commission or otherwise; and to that end shall keep . . . or have in readiness . . . such . . . sufficient post-horses . . . as their own abilities will bear, or that the contributory provision of the towns . . . shall enable them unto;" (2.) that "it shall be lawful for the posts or the owners of the horses to demand for the hire of each horse, after the rate of twopence-halfpenny the mile, besides the guides' groats, of all such as ride on public affairs. But of all others riding post with horn and guide about their private businesses, the hire and prices are left to the parties' discretion, to agree and compound within themselves." Finally, it is directed that every post shall keep at least two horses for the express conveyance of government letters, shall forward such letters within a quarter of an hour of their receipt, and shall travel at the rate of not less than seven miles the hour in summer and five miles in winter.[2]

Appointment of a postmaster-general for foreign parts (1619).

In 1619 a new office of "postmaster-general of England for foreign parts, being out of our dominions," was created by letters-patent of James I., in favour of Matthew de Quester,[3] and Matthew de Quester the younger, the former of whom, it is recited, "had humbly petitioned us in respect of his many years' service in sending packets in foraine parts, and for that he had beene often occasioned to send speciall messengers beyond the seas in matters of more importance," &c. The new office was regarded by the existing postmaster-general, Charles, Lord Stanhope (who had succeeded his father) as an infringement of his own patent. On a reference to the council, it was declared that "both grants might well stand together, being of distinct places," but the dispute, as we shall see, lasted for many years, and had curious consequences.

After a trial in the King's Bench, which had no definite result, the matter came repeatedly before the Lords of the Council. In 1626 the Council ordered that, "as most of the foreign posts were now well settled by the labour and industry of the said De Quester, . . . the Marchants Adventurers and other marchants should attend the board, and show cause why he should not be likewise employed by them for their dispatches into foreign parts without the king's dominions." But on a hearing, "liberty was given as well to all other companies of merchants as to the Merchants Adventurers, to send their letters and dispatches by messengers of their own choosing." A year afterwards this liberty was revoked, except as regarded the Company of Merchants Adventurers only. Lord Stanhope, however, continued by his agents to carry letters abroad, and obtained a warrant prohibiting De Quester from interfering. Sir John Coke, writing to his fellow-secretary, Lord Conway, deplores "the audacity of men in these times, and that Billingsley, a broker by trade (the deputy of Lord Stanhope), should dare to attempt thus often to question the King's service, and to derive that power of foreign letters unto merchants, which in all States is a branch of regal authority. Neither can any place in Christendom be named where merchants are allowed to send their letters by other bodies or posts than by those only which are authorized by the State." Billingsley was imprisoned; but the House of Commons addressed the King for his release.[1] It strikingly shows the confusion of postal affairs at this period to find a statement addressed to the Privy Council by "all the posts of England, being in number ninety-nine poor men," that divers of them "lie now in prison, . . . by reason of their great debts which they are in, for want of their entertainment, they being unpaid ever since the last day of November 1621 till this present time, June 1628;" the arrears amounting to L.22,626. In 1632 the foreign postmastership was assigned by the De Questers to William Frizell and Thomas Witherings.

[2] *Book of Proclamations*, p. 67 (State-Paper Office); *Report from the Secret Committee on the Post-Office*, 1844, Appendix, pp. 38-40.

[3] Or "De l'Equester," as he is called in Latch's *Reports of King's Bench Cases*, p. 87.

The substitution was approved by the King, and was notified by a royal proclamation in July 1632. Amongst other recitals, this document sets forth the King's consideration "how much it imports his state and this realm, that the secrets thereof be not disclosed to foreign nations, which cannot be prevented if a promiscuous use of transmitting . . . foreign letters and packets should be suffered, which will also be no small prejudice to . . merchants in their trading."[2] Here we get a glance at one of the motives of the jealous monopoly of postal communication,—a motive which found still plainer expression in Sir John Coke's letter to Lord Conway, cited above, when he wrote, "Your Lordship best knoweth what account we shall be able to give in our places of that which passeth by letters in or out of the land, if every man may convey letters, under the covers of merchants, to whom and what place he pleaseth." Coke seems to have solved the difficulty in his own fashion, for, a few years afterwards, an English letter-writer tells his correspondent in Scotland, "I hear the posts are waylaid, and all letters taken from them and brought to secretary Cooke."[3]

Inland Letter Office, established in 1635.

In June 1635 Witherings submitted to the king a proposition (still preserved in the State-Paper Office), "for settling of staffets or pacquet-posts betwixt London and all parts of his Majesty's dominions, for the carrying and re-carrying of his subjects' letters," which contains some curious incidental notices of the then state of the internal communication of the kingdom. The nett charge to the Crown of the existing posts is stated to be L.3400 per annum. Letters, it is said, "being now carried by carriers or footposts 16 or 18 miles a day, it is full two months before any answer can be received from Scotland or Ireland to London. If any of his Majesty's subjects shall write to Madrid in Spain, he shall receive answer sooner and surer than he shall out of Scotland or Ireland." By the new plan it is proposed that all letters for the northern road, for example, "be put into one portmantle that shall be directed to Edinburgh, and for all places of the said road, . . . with particular bags directed to such postmasters as live upon the road near to any city or town corporate." The postage is to be, according to distance, "3d., 4d., 6d., and to Scotland more." The journey from London to Edinburgh is to be performed within three days; so that, says the proposer, "the posts being punctually paid, the news will come sooner than thought." The scheme was approved of on the 31st July 1635 by "a proclamation for the settling of the letter office of England and Scotland." This proclamation provides for eight main postal lines—namely, the Great Northern Road; to Ireland by Holyhead; to Ireland by Bristol; to the marches of Wales by Shrewsbury; to Plymouth; to Dover; to Harwich; and to Yarmouth. The postage of a single letter is fixed at 2d., if under 80 miles; 4d., if between 80 and 140 miles; 6d., if above 140 miles; 8d., if to Scotland. And it is signified to be his Majesty's pleasure that from the beginning of this service no other messengers or foot-posts shall carry letters to any places so provided, "except common known carriers, or a particular messenger to be sent on purpose with a letter by any man for his own occasions, or a letter by a friend;" on pain of exemplary punishment.[4] In February 1638 another royal proclamation ratified an agreement between Witherings and M. Denoveau, "postmaster to the French King," for the conveyance of the mails into France by Calais, Boulogne, Abbeville, and Amiens.[5]

The post-office during the civil wars.

But in 1640 the active postmaster is accused of "divers abuses and misdemeanours," and his office is sequestrated into the hands of Philip Burlamachi of London, merchant, who is to execute the same under the inspection of the principal secretary of state.[6] Witherings then assigns his patent to Robert Rich, Earl of Warwick. A long contest ensues in both Houses of Parliament. Lord Stanhope petitions the House of Lords, and asserts that his surrender of his prior patent was compulsory, he having been summoned to the council table, and obliged, before he was suffered to depart, to subscribe somewhat then penned upon your petitioner's patent by the lord keeper Coventry." These complaints and debates gave repeated occupation to both Houses during the memorable period from 1641 to 1647, and were diversified by several affrays, in which violent hands were laid upon the mails; "one Mr Prideaux," afterwards attorney-general, actively assisting on one occasion in the seizure of that from Plymouth, as it was being carried into the post-office which had been opened by the Earl of Warwick, "near the Royal Exchange." On another occasion the Chester mail, according to the depositions of the earl's officers, was met at the foot of Highgate Hill by five persons "on great horses, with pistols, habited like troopers, who demanded of these deponents, Who had the letters? saying they must have them;" and who kept their word. These incidents occur in 1642. In 1644 the Lords and Commons, by a joint ordinance, appoint Edmund Prideaux "to be master of the posts, messengers and couriers." In 1646 the opinion of the judges is taken on the validity of Witherings' patent (assigned to Lord Warwick), and they pronounce "that the patent of the Inland Letter Office was well created; that the clauses of restraint in the said patent are void and not good in law; that, notwithstanding these clauses be void, the patent is good for the rest."[7] It is evident, therefore, that any prohibition to carry letters must be by act of Parliament, to have force of law.

The post-office under the Commonwealth

In 1650 an attempt was made by the Common Council of London to organize a new postal system on the great roads, to run twice a week. This scheme they temporarily carried into effect as respects Scotland. But Mr Attorney-General Prideaux speedily obtained the intervention of the Council of State. He drew up a paper in which he thus summed up his own proceedings in postal matters:—"By authority of the Parliament, I erected postages for the service of the State. For defraying the charges of the several postmasters and easing the State of it, I published that there should be a weekly conveyance of letters into all parts of the nation. With the benefit which came by the postage of letters, I have taken off from the State the charge of the postmasters of England (except Dover road), which is above L.7000 by the year." Prideaux seems to have been especially wroth with the Common Council of London for their audacity in having "employed a natural Scott into the North." He urged on the Council of State, that if the new enterprise be permitted, "besides intrenching on the rights of the Parliament, it will distract that course which is now settled, ... and another way must be thought on for payment of the postmasters." Both Houses resolved: (1.) "That the offices of postmasters, inland and foreign, are, and ought to be, in the sole power and disposal of the Parliament. (2.) That it be referred to the Council of State to take into consideration all existing claims in relation thereto. Of these there were no less than five under the various patents which had been granted and assigned. Ultimately, the posts, both inland and foreign, were farmed to John Manley for L.10,000 a year, by an agreement made in 1653. The rates of postage and the rights and duties of postmasters were settled, under the Protectorate, by an act of Parliament of 1657, c. 30. In 1659 the item, "By postage of letters in farm, L.14,000," appears in a Report on the Public Revenue.[1]

Settlement of the post-office under Cromwell.

During the rule, both of Parliament and of Protector, the practice of opening letters, on suspicion of plots, continued. Foreign mails were repeatedly stopped, and committees nominated to open and read letters. On one occasion, a message having been sent to the Lords, the answer was returned, "that they did yield to the opening of letters, but it would be very inconvenient if often used." On another occasion a formal complaint against the practice was made to the Lords by the Venetian ambassador; and the House resolved, "that four members of this House be forthwith sent to the ambassador to disavow the action, and to endeavour to give him all satisfaction, by declaring how sensible they are of it, as tending to the breach of public faith and the law of nations." Nevertheless, the act of 1657 expressly enumerates among the advantages of a post-office, that "it hath been found by experience, ... the best means . . . . to discover and prevent many dangerous and wicked designs which have been, and are daily contrived, against the peace and welfare of this Commonwealth, the intelligence whereof cannot well be communicated but by letter of escript."[2] And the numerous "intercepted letters" which appear amongst the Thurloe State Papers, sufficiently show how extensively those advantages were turned to account.

The government of the Restoration continued to farm the post-office upon conditions very similar to those imposed by the act of 1657, but for a larger sum. Henry Bishop was the first postmaster-general, and he contracted to pay to the King a yearly rent of L.21,500. The new arrangements were embodied in the act 12 Charles II., c. 35, entitled "An Act for Erecting and Establishing a Post-Office." A clause proposing to frank all letters addressed to or sent by members of Parliament during the session was carried, on a division, after considerable debate, in the course of which Sir Heneage Finch characterized it as "a poor mendicant proviso, and below the honour of the House." Even the Speaker, on putting the motion from the chair, paused to say, "I am ashamed of it." The Lords struck it out of the bill, and the Commons agreed to their amendment.[3] But the indenture enrolled with the letters-patent contains a proviso for the free carriage of all letters to or from the King, the great officers of state, "and also the single inland letters only of the members of the present Parliament during the continuance of this session of this Parliament." It is also provided that the lessee shall permit the secretaries of state for the time being, or either of them, from time to time, to have the survey and inspection of all letters at their discretion. Bishop was succeeded by Daniel O'Neile in 1662, on similar terms. In the consequent "proclamation for quieting the postmaster-general in the execution of his office," which was issued, as usual, on the 25th May 1663, it is commanded "that no postmasters or other officers that shall be employed in the conveying of letters, or distributing of the same, or any other person or persons, . . . *except by the immediate warrant of our principal secretaries of state*, shall presume to open any letters or pacquets not directed unto themselves."

By an act of the 15th Charles II. ("An Act for Settling the Profits of the Post-Office on H.R.H. the Duke of York, and his Heirs-Males"); and by a subsequent proclamation issued in August 1683, "for prevention of treasonable correspondences and other inconveniences arising by the infringement of the said act," it is directed that the postmaster-general shall "take effectual care for the conveyance of all bye-letters, by establishing correspondences . . . in all considerable market-towns with the next adjacent post-stage, and all persons whatsoever, other than the postmaster-general, are warned that they presume not to prepare or provide any horses or furniture to let to hire, ... where any post-roads are or shall be settled or established, unless the postmaster or his deputies shall first fail to provide and furnish the persons riding post with sufficient horses and furniture within half an hour after demand."

Establishment of the London penny post.

It was during the possession of the post-office profits by the Duke of York that a London penny post was established by the enterprise of William Dockwra, who is described as a London merchant. A suit was commenced against him at the duke's instance, and a verdict, casting him in damages, was obtained in the King's Bench. Soon after the Revolution he was one of the multitude of petitioners for redress at the hands of the House of Commons, by whom his case was recommended to the king, who, in 1690, granted him a pension of L.500 a year for a limited term, and in 1697 appointed him "comptroller of the penny post." But in the following year a long list of charges was exhibited against him by the "officers and messengers," which led to his removal. At this time parcels were carried as well as letters. One of the allegations against Dockwra runs thus:—"Hee stops under spetious pretences most parcells that are taken in, which is great damage to tradesmen, by loosing their customers, or spoiling their goods, and many times hazard the life of the patient when phisick sent by a doctor or apothecary."[4] Dockwra's example was imitated in 1708 by Mr Povey, who took "upon himself to set up a foot-post under the name of the 'halfpenny carriage,' appointed receiving-houses, and employed several persons to collect and deliver letters for hire within the cities of London and Westminster, and borough of Southwark, ... to the great prejudice of the revenue," as was represented by the then postmaster-general to the Lords of the Treasury. Povey was compelled to desist.

The Scottish post-office from the Restoration to the reign of Queen Anne.

At this period the postal system of Scotland was distinct from that of England. It had been so re-organized early in the reign of Charles II., who, in September 1662, had appointed Patrick Grahame of Inchbrakie to be postmaster-general of Scotland for life, at a salary of L.500 Scots. But it would seem, from the proceedings of the Scottish Privy Council, that the rights and duties of the office were ill defined; for immediately after the appointment of Grahame, the Council commissioned Robert Mein, "merchant and keeper of the letter-office in Edinburgh," to establish posts between Scotland and Ireland; ordained that Linlithgow, Kilsyth, Glasgow, Kilmarnock, Dumboag, Ballintrae, and Portpatrick, should be stages on the route, and granted him the sum of L.200 sterling, to build a packet-boat to carry the mail from Portpatrick to Donaghadee."[1] And in 1665 we have a privy seal by which the postmaster of Haddington, William Seton, is granted a salary exceeding that of the postmaster-general, namely, L.600 Scots a year.[2] The rate of speed at which ordinary correspondence travelled in those days may be estimated from the fact, that the express conveying intelligence of the death of Charles II., on the 6th of February, was received in Edinburgh at one o'clock on the morning of the 10th. In 1695 the Scottish Parliament again re-organized the post-office, and fixed the rates of postage at 2d. for a single letter to Berwick, or any place within 50 miles of Edinburgh; 3d. from 50 to 100 miles; 4d. to any place in Scotland above 100 miles; and also established a weekly post between Scotland and Ireland. In 1698 Sir Robert Sinclair of Stevenson had a grant from King William of the whole revenue of the Scottish post-office, in addition to a pension of L.300 per annum, "to keep up the post." But he speedily resigned the grant.[3] Six years later, however, we find George Main, jeweller in Edinburgh, accepting a lease of that revenue at a yearly rent of L.1194 sterling, subject to certain deductions for the conveyance of public expenses, and also to an allowance of L.60 a year for the Irish packet. Main appears to have paid to the postmaster at Haddington, L.50; to him in Canongate, L.35; to him at Cockburnspath, L.50; and to the clerk to the post-office, L.25. His lease was for three years, and would seem not to have invited renewal, as we find him acting in 1708 at a yearly salary of L.200 sterling. At this date the Edinburgh post-office employed seven persons, and its entire cost was L.364 a year (postmaster, L.200; accountant, L.50; clerk, L.50; clerk-assistant, L.25; three letter-carriers, each L.13).

The postal arrangements of the British colonies.

Our colonial post-office at this period was naturally more rudimental still. Perhaps the earliest official notice of it is to be seen in the following paragraph from the records of the General Court of Massachusetts in 1639:—"It is ordered that notice be given that Richard Fairbanks his house in Boston is the place appointed for all letters which are brought from beyond the seas, or are to be sent thither to be left with him; and he is to take care that they are to be delivered or sent according to the directions; and he is allowed for every letter a penny, and must answer all miscarriages through his own neglect in this kind." That court, in 1667, was petitioned to make better postal arrangements, the petitioners alleging the frequent "loss of letters whereby merchants, especially with their friends and employers in foreign parts, are greatly damnified; many times the letters are imputed (?) and thrown upon the Exchange, so that those who will may take them up; no person, without some satisfaction, being willing to trouble their houses therewith." In Virginia the postal system was yet more primitive. The colonial law of 1657 required every planter to provide a messenger to convey the despatches as they arrived to the next plantation, and so on, on pain of forfeiting a hogshead of tobacco for default. The government of New York in 1672 established "a post to goe monthly from New York to Boston," advertising "those that bee disposed to send letters; to bring them to the secretary's office, where, in a lockt box, they shall be preserved till the messenger calls for them; all persons paying the post before the bagg be sealed up."[4] Thirty years later this monthly post had become a fortnightly one, as we see by the following paragraph in the *Boston News-Letter*:—"By order of the postmaster-general of North America. These are to give notice, That on Monday night, the 6th of December, the Western Post between Boston and New York sets out once a fortnight, the three winter months of December, January, and February, and to go alternately from Boston to Saybrook, and Hartford, to exchange the mayle of letters with the New York Ryder; the first turn for Saybrook, to meet the New York Ryder on Saturday night the 11th currant; and the second turn he sets out at Boston on Monday night the 20th currant, to meet the New York Ryder at Hartford, on Saturday night the 25th currant, to exchange Mayles; and all persons that sends letters from Boston to Connecticut from and after the 13th inst., are hereby notified first to pay the Postage on the same."[5]

This office of postmaster-general for America had been created in 1692. The rates of postage were,—for 80 miles or under, 4½d.; from New York to Philadelphia, 9d.; to Virginia, 12d. For a long time the expenses of the office exceeded the income. Until after 1704 there was no regular post further east than Boston, or further west than Philadelphia. In that year Lord Cornbury, writing to the government at home, says,—"If I have any letter to send to Virginia or to Maryland, I must either send an express, who is often retarded for want of boats to cross those great rivers they must go over, or else for want of horses; or else I must send them by some passengers who are going thither. The least I have known any express to take hence to Virginia has been three weeks.[6] Shortly after the date of this letter stage-coaches were established between Boston and New York, and Boston and Philadelphia; but no post-office was established in Virginia until 1732; nor did any postal revenue accrue to Great Britain from the colonies until 1753.

Consolidation of the British post-office by 9 Anne, c. 10.

We have now traced the postal communications of different portions of the British empire from their earliest beginnings until the eve of the passing of that act of the 9th of Queen Anne, which consolidated them into one establishment, and which, as to organization, continued to be the great charter of the post-office until the advent of Mr Rowland Hill. This act largely increased the powers of the postmaster-general. It re-organized the chief letter-offices of Edinburgh, Dublin, and New York, and settled new offices in the West Indies and elsewhere. It established three rates of single postage,—viz., English, 3d. if under 80 miles, and 4d. if above; and 6d. to Edinburgh or Dublin. It continued to the postmaster-general the sole privilege "to provide horses to persons riding post." And it gave, for the first time, parliamentary sanction to the power, formerly questionable, of the secretaries of state with respect to the opening of letters, by the following clause:—"And whereas abuses may be committed by wilfully opening, embezzling, detaining, or delaying letters or packets, to the great discouragement of trade, commerce, and correspondence; for prevention thereof be it enacted . . . . that from and after the 1st day of June 1711, no person or persons shall presume . . . to open, detain, or delay . . . any letter or letters . . . after the same is or shall be delivered into the general or other post-office, . . and before delivery to the persons to whom they are directed, or for their use, *except by an express warrant in writing under the hand of one of the principal secretaries of state, for every such opening, detaining, or delaying.*"

[6] Miles, ut supra.

Nine years after the passing of this act, the cross-posts were farmed to a Mr Allen, who made great improvements in their management, upon an agreement that the new profits so created should be his own during his lifetime. His schemes were so successful that he is said to have netted during forty-two years an average profit of nearly L.12,000 a year. The nett revenue for the post-office, which, as we have seen, had been L.10,000 in 1653, and L.21,500 in 1663, had increased in 1685 to L.65,000. For the succeeding ten years it was almost stationary. At the passing of the act of Anne it had reached L.90,223, the gross income being L.111,426. In twelve years (1724) the latter had increased to L.178,071, but the nett revenue was only L.96,339. Then followed a series of supplementary enactments having for their object the increase of postal rates, the regulation of franking, and the prevention of illicit conveyance. Very little attention seems to have been bestowed on the increase of postal facilities, and the results corresponded. In 1754 the gross income was but L.214,300, and the nett revenue L.97,365. The falling in of Allen's lease in 1764 gave a considerable increase (the nett produce rising from L.116,182 to L.157,571), but after five years this was followed by a decrease, which, with slight intermission, continued until the introduction of the mail-coach system of John Palmer in 1784. The precise figures will be shown by the following table, which we abridge from the parliamentary returns of 1808:—

Tabular view of the post-office revenue from 1724 to 1784.

Post-Office of Great Britain; gross and nett income, 1724–83.

Decennial Periods.	Gross Produce of the First and Last Year. L.	s.	d.	Nett Revenue of the First and Last Year. L.	s.	d.	Average Nett Yearly Revenue of the Decennium. L.	s.	d.

Pensions charged upon this revenue.

The system of burdening the post-office revenue with pensions, nearly all of which had not the slightest connection with the postal service, was begun in characteristic fashion by Charles II., who granted to Barbara, Duchess of Cleveland, L.4700 a year, and to the Earl of Rochester L.4000 a year, out of that revenue. The example was followed, until, in 1694, the list of pensions so chargeable stood thus:—

Post-Office of Great Britain.—Pensions Charged on Revenue.

Earl of Rochester	L.4,000
Duchess of Cleveland	4,700
Duke of Leeds	3,500
Duke of Schomberg	4,000
Earl of Bath	2,500
Lord Keeper	2,000
William Dockwra (until 1697)	500
Total	L.21,200

Queen Anne granted a pension of L.5000 to the Duke of Marlborough, charged in like manner. For many years past the amount of these pensions has been L.10,307 a year. In 1856 it was L.29,310, but of that sum L.19,003 was expended in the purchase of part of the pension enjoyed by the heirs of the Duke of Schomberg. In March 1857 the existing pensions ceased to be payable by the post-office, and became chargeable to the Consolidated Fund.

The mail-coach system of John Palmer.

The first important and enduring impulse to the development of the latent powers of the post-office, both as a public agency and as a source of revenue, was given by the shrewdness and energy, not of a postmaster or other official person, but of the manager of the Bath theatre, Mr John Palmer. Mr Palmer's notice was attracted to the subject in October 1782. His avocations had made him familiar with that great western road which was still in such peculiar favour, alike with people of fashion and with the gentlemen of the highway. No road in England was so much travelled by the wealthy, and on none were they eased of their superfluities with so polite an air. In the intervals of this more agreeable department of their calling, the highwaymen relieved their ennui by a sedulous attention to the mails. So habitual were the robberies of the post, that they came to be regarded by its officials as among the necessary conditions of human affairs. They urged on the public the precaution of sending all bank-notes and bills of exchange in halves, and pointed the warning with a philosophical remark, that "*there are no other means of preventing robberies with effect*, as it has been proved that the strongest carts that could be made, lined and bound with iron, were soon broken open by a robber." Another functionary, who had reflected on the matter still more deeply, suggested that "when desperate fellows had once determined on a mail robbery, the consequence would be murder in case of resistance."

At this period, in addition to the recognised perils of the roads, the postal system was characterized by extreme irregularity in the departure of mails and delivery of letters; by an average speed of about three miles and a half in the hour; and by a rapidly-increasing diversion of correspondence into illicit channels. As our table shows, the nett revenue, which had averaged L.157,000 during the ten years ending with 1773, averaged but L.150,000 during the ten years ending with 1783. Yet when Mr Palmer suggested that by building mail-coaches of a construction expressly adapted to run at a good speed, by horsing them liberally, and attaching an armed guard to each coach, the public would be greatly benefited, and the post-office revenue considerably increased, one official person expressed his regret "that the author of the plan should not first have been informed of the nature of the business," and boldly asserted that the constant endeavours which had long been directed towards the improvement of postal affairs, "in all situations and under all circumstances, has made them now almost as perfect as can be, without exhausting the revenue arising therefrom." Another predicted that the new methods, if adopted, "will fling the whole commercial correspondence of the country into confusion, and will justly raise such a clamour as the postmaster will not be able to appease."

At one time this pertinacious opposition seemed likely to succeed. But, through the intervention of Lord Camden, the plan was brought under the personal notice of Mr Pitt. No sooner was the minister convinced of its merits than he insisted on its being tried. The experiment was made in August 1784. In the following year Mr Palmer, writing to Mr Pitt, says (and his assertion is fully borne out by the documents subsequently submitted to Parliament):—"In the progress of this business I have had every possible opposition from the office." Yet its success exceeded all anticipation. The following table will show the rapid progress of the revenue under the new arrangements:—

Tabular view of the growth of the postal revenue under Palmer's system.

Post-Office of Great Britain.—Gross and Nett Income, 1784–1808.

The three years in this instructive table to which asterisks are affixed convey a special lesson, which seems to have passed unheeded at the time, although it has since been turned to good account. In each of those years additional rates of postage were imposed, and in each of the succeeding periods the estimated produce of the additional tax failed to be realized. The revenue, indeed, continued to increase with the growth of trade and population, but the *proportional* rate of that increase was checked. It had been at first proposed to reward Mr Palmer by a grant for life of two and a half per cent. on a certain proportion of the increased nett revenue, which would eventually have given him some L.10,000 a year; but this proposition fell through, in consequence either of technical difficulties created by the Post-Office Act, or of the opposition of the post-office authorities. Mr Pitt, however, appointed Palmer to be "Comptroller-General of Postal Revenues," an office which was soon made too hot for him to hold. He obtained a pension of L.3000 a year; and ultimately, by the act 53 Geo. III., c. 157, after his case had received the sanction of five successive majorities against government, an additional sum of L.50,000. Every sort of obstruction was placed in the way of his reward—the claim to which was pending in Parliament during six years—in exact harmony with the course which had been pursued at the outset of the scheme. And this was done in the face not alone of nearly a million annually added to the public revenue, but of the fact, that during a quarter of a century the mails had been conveyed over an aggregate of some seventy millions of miles without the occurrence of one mail robbery throughout the period.[2]

Comparison of postal affairs in Scotland and Ireland at end of 18th century.

Scotland shared in the advantages of the mail-coach system from the first. Shortly before its introduction, the local penny post was set on foot by the keeper of a coffee-shop in the hall of the Parliament House, Peter Williamson by name. He employed four letter-carriers, in uniform, and provided them with bells; appointed receivers in various parts of the town; and established hourly deliveries.[3] The officials of the post, when the success of the plan had become fully apparent, gave Williamson a pension, and absorbed his business, the acquisition of which was subsequently confirmed by the act 34 Geo. III., c. 17. A dead-letter office was established in 1784. The entire staff, which, as we have seen, consisted in 1708 of seven persons, now comprised twenty-five, at a cost of L.1406. In 1796 the number of functionaries had increased to forty, and the cost to L.3278.[4] But in Ireland the old state of things continued until the present century. In 1801 only three public carriages in the whole country conveyed mails. There were, indeed, few roads of any sort, and none on which coaches could travel faster than four miles an hour.[5] At this period the gross receipts of the Irish post-office were L.80,040; the charges of management and collection were L.59,216, or at the rate of more than 70 per cent.; whilst in Scotland the receipts were L.100,651, and the charges L.16,896, or somewhat less than 17 per cent.[6]

The post-office in America prior to the Revolution

In the American colonies postal improvements may be dated from the administration of Franklin, who was virtually the last colonial postmaster-general, as well as unquestionably the best. In one shape or other he had forty years' experience of postal work, having been appointed postmaster at Philadelphia as early as October 1737. He notified his appointment in his own newspaper in these words:—"Notice is hereby given, that the post-office of Philadelphia is now kept at B. Franklin's in Market Street, and that Henry Pratt is appointed riding postmaster for all stages between Philadelphia and Newport in Virginia, who sets out about the beginning of each month, and returns in 24 days, by whom gentlemen, merchants, and others may have their letters carefully conveyed," &c.[7] When appointed postmaster-general in 1753, Franklin bestirred himself for the improvement of his department, in that practical painstaking way with which he was wont to guide any plough he had once put his hand to, whatever the ground it had to work in. He visited all the chief post-offices throughout Pennsylvania, New Jersey, New York, and New England, looking at everything with his own eyes. His administration cannot be better summed up than we find it to be in a sentence or two which he wrote soon after his dismissal. Up to the date of his appointment, he says,—"The American post-office had never paid anything to that of Britain. We (*i.e.*, himself and his assistant) were to have L.600 a year between us, if we could make that sum out of the profits of the office. To do this, a variety of improvements were necessary: some of these were inevitably, in the beginning, expensive; so that in the first four years the office became above L.900 in debt to us. But it soon after began to repay us; and before I was displaced by a freak of the minister's, we had brought it to yield three times as much clear revenue to the crown as the post-office of Ireland. Since that imprudent transaction, they have received from it—not one farthing."

The Reports of the Commissioners of Inquiry into Post-Office Revenue, 1826-30.

The interval between the development of Mr Palmer's improved methods (as far as that development was permitted by the authorities), which we take to be pretty nearly contemporaneous with the parliamentary settlement of his claims, and the still more important reforms introduced thirty years afterwards by Mr Rowland Hill, is chiefly marked by the growth of the packet system, under the influence of steam navigation, and by the elaborate investigations of the revenue commissioners of 1826 and the following years. Undoubtedly, the inquiries of these commissioners attracted a larger share of public attention to the management of the post-office than had theretofore been bestowed on it; but if anything had been wanted to throw into bolder relief Mr Hill's intelligent and persevering exertions, these reports supply the want in ample measure. The lucubrations of the commissioners have the merit of repletion,—they fill three large folios; but the most friendly critic could scarcely find in them any other. Clumsy in arrangement, resilient in the treatment of the various branches of the service, and crowded with petty details, they afford the best possible contrast to the lucid order and vigorous reasoning of Mr Hill's *Post-Office Reform.* Nor is it the least curious infelicity of the Revenue Reports of 1826–30, that whilst the functionaries of the post-office are criticised in them with a keen severity, which is so salient as to wear an appearance at times of almost personal hostility, the truth, that a liberal increase of public facilities would be likely to benefit the revenue much more materially than small economies in salaries and perquisites, does not seem once to have dawned on the minds of the commissioners. Even in dealing with a new accommodation actually provided,—that of the money-order office,—whilst taking just exception to the unofficial character of its management, they incline rather to its abolition than its reform.

---

Postal packet system.

As early as 1788 the cost of the packets employed by the post-office attracted parliamentary attention. In that year the "Commissioners of Fees and Gratuities" reported that, in the preceding seventeen years, the total cost of this branch had amounted to L.1,038,133; and they naturally laid stress on the circumstance, that "many officers of the post-office were owners of such packets, even down to the chamber-keeper." At this time part of the packet service was performed by hired vessels, and part by vessels which were the property of the crown. The commissioners recommended that the latter should be sold, and the entire service be provided for by public and competitive tender. The subject was again inquired into by the Finance Committee of 1798, which reported that the recommendation of 1788 had not been fully acted upon, and expressed its concurrence in that recommendation. The plan was now to a considerable extent enforced. But the war rapidly enhanced the expenditure. The average, L.61,000, of 1771–87 had increased, in 1797, to L.78,439; in 1810 to L.105,000, in 1814 to L.160,603. In the succeeding years of peace the expense fell to an average of about L.85,000. As early as 1818 the Rob Roy plied regularly between Greenock and Belfast; but no use was made of steam navigation for the postal service until 1821, when the postmaster-general established crown packets. The expenditure under the new system, from that date to 1829 inclusive, was thus reported by the Commissioners of Revenue Inquiry in 1830:—

Post-Office of Great Britain.—Cost of Packet Service, 1820–29.

Year.		L.
1820	(last year of exclusive sailing-packets)	85,000
1821	(first year of steam-packets)	134,868
1822		115,429
1823		93,725
1824		116,062
1825		110,838
1826		144,592
1827		159,250
1828		117,260
1829		108,305[1]

The general administration of postal affairs, during the period now under review, was still characterized by repeated advances in the letter-rates, and the last twenty years of it by a stationary revenue. The following table will show the gross receipts, the charges of collection and management, and the nett revenue (omitting fractions of a pound). We repeat the figures for the year 1808 for the purpose of comparison:—

Post-Office of Great Britain.—Gross and Nett Income, 1808–1837.

Year.	Gross Income.	Charges of Collection, &c.	Rate per cent of Charges.	Nett Revenue.	Population of United Kingdom.
	L.	L.		L.	
1808	1,552,037	451,431	29	1,100,606	...
1815–1816	2,193,741	594,045	27	1,526,527	19,552,000
1818–1819	2,209,212	719,622	31½	1,489,590	...
1820–1821	2,132,235	636,290	28½	1,495,945	20,928,000
1824–1825	2,255,239	655,914	26½	1,599,325	22,362,000
1826–1827	2,392,272	747,018	28½	1,645,254	...
1836–1837	2,206,736	609,220	27½	1,511,026	25,605,000
1838–1839	2,346,278	686,768	29	1,659,510	...

The history of governmental interference with correspondence resumed.

Before passing to the reform of 1839, we have now to revert to that important feature in postal history,—the interference with correspondence for judicial or political purposes. We have already seen,—(1.) That this assumption had no parliamentary sanction until the enactment of the 9th of Queen Anne; (2.) That the enactment differed from the pre-employed royal proclamations in directing a special warrant for each opening or detention of correspondence. It is a significant gloss on the statute to find that for nearly a century (namely, until 1798 inclusive) it was "not the practice to record such warrants regularly in any official book."[2]

Atterbury's case.

Of the use to which the power was applied, the State Trials afford some remarkable instances. At the trial of Bishop Atterbury, for example, in 1723, certain letters were offered in evidence which a clerk of the post-office deposed on oath "to be true copies from the originals, which were stopped at the post-office, and copied, and sent forward as directed. Hereupon Atterbury very naturally asked this witness, "If he had any express warrant under the hand of one of the principal secretaries of state for opening the said letters." But on this question the lords, after debate, resolved,—"That it is the opinion of this House that it is inconsistent with the public safety, as well as unnecessary for the prisoner's defence, to suffer any further inquiry to be made, upon this occasion, into the warrants which have been granted by the secretaries of state for the stopping and opening of the letters which should come and go by the post, or into the methods that have been taken by the proper officers at the post-office in obedience to such warrants." Twenty-nine peers recorded their protest against this decision. But the inflamed majority went the further length, when it was proposed to cross-examine the Rev. Edward Willes, one of his Majesty's post-office decipherers, of again resolving,—"That it is the opinion of this House, that it is not consistent with the public safety to ask the decipherers any questions which may tend to discover the art or mystery of deciphering.[3]

Proceedings of the House of Commons in relation to opening of letters in 1735.

The practice thus sanctioned appears to have been pushed to such lengths as to elicit in April 1735 a strong protest and censure from the House of Commons. In the preceding February "Complaints were made by several members that their letters were not only charged at the post-office, but that they were often broke open and perused by the clerks; that the practice of breaking open letters was become frequent, and was so publicly known that the very end for which that liberty was given to the postmaster was entirely disappointed; for the intention being at first to discover any treasonable correspondence that might be carried on against the government, that intention was rendered altogether vain, because, by the practice of opening letters being so frequent and so well known, it was certain that no man would carry on any treasonable correspondence by means of the post-office; so that the liberty given to break open letters . . . . could now serve no purpose but to enable the idle clerks about that office to pry into the private affairs of every merchant and of every gentleman in the kingdom."[1] A committee of inquiry was appointed, and after receiving its report, the House resolved: "That it is an high infringement of the privileges of the . . . Commons of Great Britain in Parliament for any postmaster, his deputies, or agents, in Great Britain or Ireland, to open or look into, by any means whatever, any letter directed to or signed by the proper hand of any member, without an express warrant in writing under the hand of one of the principal secretaries of state for every such opening and looking into; or to detain or delay any letter directed to, or signed with the name of any member, unless there shall be just reason to suspect some counterfeit of it, without an express warrant of a principal secretary of state for every such detaining or delaying." That the expressions used in debate were fully borne out by post-office practices there is abundant evidence.[2] In the subsequent proceedings of the famous "Committee of Secrecy on the conduct of Robert, Earl of Orford, "it appeared by the testimony of the secretary of the post-office, that within ten years only there had been paid by the government to that officer, without voucher or account, the sum of L.45,675, and that "the greatest part of this money is for defraying the expense of a private office for the inspecting foreign correspondence. . . . . That the annual expenses of this office are as follows:—To the chief decipherer, Dr Willes, for himself and his son, L.1000; to the second decipherer, Mr Corbiere, L.800; to the third decipherer, Mr Lampe, L.500; to the fourth decipherer, Mr Zolman, L.200; to the chief clerk, L.650; to four other clerks, L.300 each; to the comptroller of the foreign office, L.60; and to the doorkeeper, L.50. There are incidental charges for seals, &c.," it is added, "which may amount to L.100; . . . . the overplus, which may amount to L.90, is divided between the two postmasters and the secretary."[3] For his twenty years' services in this "private office" the Rev. Dr Willes was rewarded, first, with the deanery of Lincoln, and afterwards with the bishopric of St David's.

Staff and salaries of the decipherers' department

As must always happen in like cases, the example spread downwards. So little attention was paid to the requirements of the act of Queen Anne, or the warnings of the House of Commons, that the very bellmen took to scrutinizing the letters given them for their bags. "When I have got all my letters together," deponed one of these functionaries at the trial of Dr Hensey in 1758, "I carry them home and sort them. In sorting them, I observed that the letters I received of Dr Hensey were generally directed abroad, and to foreigners; and I, knowing the Doctor to be a Roman Catholic, . . . advised the examining clerk at the office to inspect his letters." This witness, in answer to the questions, "How came you to know Dr Hensey was a Roman Catholic? What had you to do with his religion?" clinched his evidence thus:—"We letter-carriers or postmen have great opportunities to know the characters and dispositions of gentlemen . . . from their servants, connections, and correspondents. But, to be plain, if I once learn that a person who lives a genteel life is a Roman Catholic, I immediately look on him as one who, by education and principle, is an inveterate enemy to my king, my country, and the Protestant religion."[4] Sometimes the political motives for examination were diversified by merely polite acquiescence in the wishes of a friend. Thus, in 1741, "at the request of A., a warrant issued to permit the eldest son of A. to open and inspect any letters which the youngest son of A. might write to either of two females, one of whom that youngest son had imprudently married.[5] What remains to be said of the more recent contents of this discreditable chapter in our postal history will be found in a subsequent page. The incidents of 1844 are yet fresh in memory.

The post-office reform of 1839.

Mr Rowland Hill's pamphlet of 1837 took for its starting-point the fact, that whereas the postal revenue showed for the past twenty years a positive, though slight, diminution, it ought to have showed an increase of L.507,700 a year, in order to have simply kept pace with the growth of population; and an increase of nearly four times that amount, in order to have kept pace with the growth of the analogous though far less exorbitant duties imposed on stage-coaches. The population in 1815 was 19,552,000. In 1835 it had increased to 25,605,000. The stage-coach duties had produced in 1815, L.217,671. In 1835 they produced L.498,497. The nett revenue arising from the post-office in 1815 was L.1,557,291. In 1835 it had decreased to L.1,540,300.

Postal statistics in 1837.

In 1837 there did not exist any accurate account of the number of the letters transmitted through the general post-office. Mr Hill, however, was able to prepare a sufficiently approximative estimate from the data of the London district post, and from the sums collected for postage. He thus calculated the number of chargeable letters at about 88,600,000; that of franked letters at 7,400,000, and that of newspapers at 30,000,000, giving a gross total of about 126,000,000. At this period the total cost of management and distribution was L.696,569. An analysis of the component parts of this expenditure assigned L.426,517 to cost of primary distribution, and L.270,052 to cost of secondary distribution and miscellaneous charges. A further analysis of the primary distribution expenditure gave L.282,308 as the probable outgoings for receipt and delivery, and L.144,209 as the probable outgoings for transit. In other words, the expenditure which hinged upon the *distance* the letters had to be conveyed was L.144,000, and that which had nothing to do with distance was L.282,000. Applying to these figures the estimated number of letters and newspapers, 126,000,000, passing through the office, there resulted a probable average cost of $\frac{84}{100}$ths of a penny for each, of which $\frac{28}{100}$ths was cost of transit, and $\frac{56}{100}$ths cost of receipt, delivery, &c. Taking into account, however, the much greater weight of newspapers and franked letters as compared with chargeable letters, the apparent average cost of *transit* became, by this estimate, but about $\frac{9}{100}$ths, or less than the tenth of a penny.

A detailed estimate of the cost of conveying a letter from London to Edinburgh, founded upon the average weight of the Edinburgh mail, gave a lower proportion still, since it reduced the apparent cost of transit, on the average, to the thirty-sixth part of penny. Mr Hill inferred that if the charge for postage be made proportionate to the whole expense incurred in the receipt, transit, and delivery of the letter, and in the collection of its postage, it must be made *uniformly* the same, from every post-town to every other post-town in the United Kingdom, unless it could be shown how we are to collect so small a sum as the thirty-sixth part of a penny. And, inasmuch as it would take a ninefold weight to make the expense of transit amount to one farthing, he further inferred that, taxation apart, the charge ought to be precisely the same for every packet of moderate weight, without reference to the number of its inclosures.

[3] Ibid. xxiv. 298.

[4] *State Trials*, xviii. 1369.

[5] *Report from Secret Committee*, 12.

At this period the rate of postage actually imposed (beyond the limits of the London district office) varied from 4d. to 1s. 8d. for a single letter, which was interpreted to mean a single piece of paper not exceeding an ounce in weight; a second piece of paper or any other inclosure, however small, constituted a double letter. A single sheet of paper, if it at all exceeded an ounce in weight, was charged with fourfold postage. The average charge on inland general post letters was nearly 9d. for each letter. Apart from the evils of an excessive taxation, with its multifarious results in checking communication, hampering trade, and creating an illicit traffic in letters which involved systematic deception, the effects upon the postal service itself were most injurious. On the one hand, a complicated system of accounts, involving both great waste of time and great temptation to fraud in their settlement; on the other, a constant invitation to the violation of that first duty of postal officers, respect for the sacredness of correspondence, by making it part of their daily work to expose letters to a strong light expressly to ascertain their contents.

These mischiefs it was proposed wholly to remove by enacting "that the charge for primary distribution,—that is to say, the postage on all letters received in a post-town, and delivered in the same or in any other post-town in the British Isles,—shall be at the uniform rate of one penny for each half-ounce; all letters and other papers, whether single or multiple, forming one packet, and not weighing more than half an ounce, being charged one penny; and heavier packets, to any convenient limit, . . . being charged an additional penny for each additional half-ounce." And it was further proposed that stamped covers should be sold to the public at such a price as to include the postage, which would thus be collected in advance.[1]

Post-office opposition to the plan.

By the public generally, and pre-eminently by the trading public, the plan was received with great favour. By the functionaries of the post-office it was at once denounced as ruinous, and ridiculed as visionary. Lord Lichfield, then postmaster-general, said of it in the House of Lords,—"Of all the wild and visionary schemes which I have ever heard of, it is the most extravagant."[2] On another occasion he assured the House that if the anticipated increase of letters should be realized, "the mails will have to carry twelve times as much in weight, and therefore the charge for transmission, instead of L.100,000 as now, must be twelve times that amount. The walls of the post-office would burst; the whole area in which the building stands would not be large enough to receive the clerks and the letters."[3]

The Report of the Select Committee on Postage of 1838.

But in the course of the following year (1838) petitions were poured into the House of Commons. A select committee was appointed, which held nearly seventy sittings, and examined eighty-three witnesses, in addition to the officers of the department. Its report (one of the most instructive and best arranged works of its class, as the report of the revenue commissioners was one of the worst), after carefully stating the questions which had to be considered, and the course of inquiry which had been pursued, thus proceeded:—"The principal points which appear to your committee to have been established in evidence are the following:—(1.) The exceedingly slow advance and occasionally retrograde movement of the post-office revenue during the . . . last twenty years; (2.) The fact of the charge of postage exceeding the cost in a manifold proportion; (3.) The fact of postage being evaded most extensively by all classes of society, and of correspondence being suppressed, more especially among the middle and working classes of the people, and this in consequence, as all the witnesses, including many of the post-office authorities, think, of the excessively high scale of taxation; (4.) The fact of very injurious effects resulting from this state of things to the commerce and industry of the country, and to the social habits and moral condition of the people; (5.) The fact, as far as conclusions can be drawn from very imperfect data, that whenever on former occasions large deductions in the rates have been made, these reductions have been followed in short periods of time by an extension of correspondence proportionate to the contraction of the rates. And, as matters of inference from fact and of opinion—

(i.) That the only remedies for the evils above stated, are a reduction of the rates, and the establishment of additional deliveries, and more frequent despatches of letters.

(ii.) That owing to the rapid extension of railroads, there is an urgent and daily-increasing necessity for making such changes.

(iii.) That any moderate reduction in the rates would occasion loss to the revenue, without in any material degree diminishing the present amount of letters irregularly conveyed, or giving rise to the growth of new correspondence.

(iv.) That the principle of a low uniform rate is just in itself; and when combined with prepayment and collection by means of a stamp, would be exceedingly convenient and highly satisfactory to the public.

The new postal law of 1839.

During the session of Parliament, which followed the presentation of this report, about 2000 petitions in favour of penny postage were presented to both Houses, and at length the chancellor of the exchequer brought in a bill to enable the Treasury to carry it into effect. The measure was carried in the House of Commons by a majority of 100, and became law on the 17th August 1839. A new but only temporary office under the Treasury was created to enable Mr Hill to superintend (although, as it proved, under very inadequate arrangements) the working out of his plan. The first step taken was to reduce, on the 5th December 1839, the London district postage to 1d., and the general inland postage to 4d. the half-ounce (except as respected places to which letters were previously carried at lower rates, those rates being continued). On the 10th January 1840 the uniform penny rate came into operation throughout the United Kingdom; the scale of weight advancing from 1d. for each of the first two half-ounces, by gradations of 2d. for each additional ounce, or fraction of an ounce, up to 16 ounces. The postage was to be prepaid, or charged at double rates. Parliamentary franking was abolished. Postage stamps were introduced on the 6th May following. The facilities of despatch were soon afterwards increased, especially by the establishment of day mails.

But on the important point of simplification in the internal economy of the post-office, with the object of reducing its cost without diminishing its working power, very little was done. In carrying out the new measures, the officers were, as the chancellor of the exchequer (Mr Baring) expressed it on one occasion, "unwilling horses." Nor need a word more be said in proof of the assertion than is contained in a naïve passage of Colonel Maberly's evidence before the Postage Committee of 1843:—"My constant language to the heads of the departments was,—'This plan we know will fail. It is your duty to take care that no obstruction is placed in the way of it by the heads of the department, and by the post-office. The allegation, I have not the least doubt, will be made at a subsequent period, that this plan has failed in consequence of the unwillingness of the government to carry it into fair execution. It is our duty, as servants of the government, to take care that no blame eventually shall fall on the government through any unwillingness of ours to carry it into proper effect.'" And, again,—"*After the first week*, it was evident, from the number of letters being so much below Mr Hill's anticipations, that it must fail, inasmuch as it wholly rested upon the number of letters; for without that you could not possibly collect the revenue anticipated." Very formidable are the prophets who can scarcely, under the limitations of average humanity, avoid promoting in their daily avocations, the fulfilment of their own prophecies.

[2] *Mirror of Parliament*, debate of 15th June 1837.

[3] Ibid., debate of 18th Dec. 1837.

Impediments to the proper working of the new plan.

The plan then had to work in the face of rooted mistrust on the part of the workers. Its author was (for a term of two years, afterwards prolonged to three) the officer, not of the post-office, but of the Treasury. He could only recommend measures the most indispensable through the chancellor of the exchequer; and when Mr Goulburn succeeded Mr Baring, the chancellor was very much of Colonel Maberly's way of thinking. It happened, too, that the trial of Mr Hill's scheme had to be carried through at a period of severe commercial depression.

Results of the first two years.

Nevertheless, the results actually attained in the first two years were briefly these:—(1.) The chargeable letters delivered in the United Kingdom, exclusive of that part of the government correspondence which theretofore passed free, had already increased from the rate of about 75,000,000 a year to that of 208,000,000; (2.) The London district post letters had increased from about 13,000,000 to 23,000,000, or nearly in the ratio of the reduction of the rates; (3.) The illicit conveyance of letters was substantially suppressed; (4.) The gross revenue, exclusive of repayments, yielded about a million and a half per annum, which was 63 per cent. on the amount of the gross revenue in 1839, the largest income which the post-office had ever afforded. These results at so early a stage, and in the face of so many obstructions, amply vindicated the policy of the new system. But by its enemies that system was loudly declared to be a failure, until the progressive and striking evidence of year after year silenced opposition by an exhaustive process.

The inquiry of 1844 into the opening of letters at the post or home offices.

In the summer of 1844 public attention was aroused in a remarkable manner to a branch of post-office administration which theretofore had been kept almost wholly out of sight. The statement, that the letters of a political refugee, long resident in England, and highly respected by all who knew him, whether sympathizing or not in his plans and aspirations, had been systematically opened, and their contents communicated to foreign governments, by Sir James Graham, then secretary of state for the home department, aroused a storm of indignation throughout the country. Men of all parties felt that this was an abuse of power, and a national degradation. The tragedy of Cosenza made a thorough investigation into the circumstances a public necessity.

The consequent parliamentary inquiry of August 1844, after retracing the earlier events connected with the exercise of the discretional power of inspection which Parliament had vested in the secretaries of state in 1710, elicited the fact, that in 1806, Lord Spencer, then secretary for the home department, introduced for the first time the practice of recording in an official book all warrants issued for the detention and opening of letters; and the additional fact, that from the year 1822 downwards, the warrants themselves had been preserved. The whole number of such warrants issued from 1806 to the middle of 1844 inclusive, was stated to be 323, of which no less than 53 had been issued in the years 1841-44 inclusive, a number exceeding that of any previous period of like extent, even in the days of Sidmouth and Castlereagh. It further appeared that the whole recorded number of warrants from the beginning of the century was 372, and that they affected the correspondence of 724 persons. The committee further stated, that eight of the warrants so issued "applied each to some particular object, but were *not restricted to any definite number of persons*." In plainer words, those eight warrants were in flagrant violation of the express words of the statute.

The 372 warrants of the period 1799-1844 the committee proceeded to classify under the following heads:—

Post-Office of Great Britain.—Classification of the Subject-Matters in relation to which Warrants were issued for the Opening of Letters, 1799-1844.

Bank of England	13	Letters returned to writers	7
Bankruptcy	2	Address copied	1
Murder, theft, fraud, &c.	144	Forged frank	1
Treason, sedition, &c.	77	Uncertain	89
Prisoners of war	13		
Revenue	5	Total	372[1]
Foreign correspondence	20		

The reader will not omit to observe that, within a period scarcely co-extensive with the official career of some living persons, eighty-nine warrants for the violation of correspondence had been issued by British secretaries of state for "uncertain" objects. The humiliation of such a record is complete when we place beside it a passage in one of the letters addressed to Mazzini by Attilio Bandiera, not the least memorable of the Neapolitan victims at Cosenza:—"*Fidando sempre sulla* nota lealtà delle poste inglesi, *potete indirizzar qui al mio nome le vostre lettere*."[2] It will need better regulations on this head than yet obtain to make the "noted integrity" of the English post-office again an article of European faith.

Further classification of the warrants for opening letters.

The committee of 1844 proceeded to report, that "the warrants issued during the present century may be divided into two classes:—1*st*, Those issued in furtherance of criminal justice, and usually for the purpose of obtaining a clue to the hiding-place of some offender, or to the mode or place of concealment of property criminally abstracted. . . . . . 2*d*, Those issued for the purpose of discovering the designs of persons known or suspected to be engaged in proceedings dangerous to the State, or (as in Mazzini's case), *deeply involving British interests*, and carried on in the United Kingdom, or in British possessions beyond the seas. *With regard to both these* classes of warrants, the object in issuing them has been, in many cases, to ascertain the views, not of the party receiving, but of the party sending the letter. In issuing these warrants, the mode of proceeding is as follows:—(1.) In the case of criminal warrants, they do not originate with the Home Office. The application is made in the first instance to that one of the two under-secretaries of state who is of the legal profession; and the usual course is for the applicant to state the circumstances in writing; but if the case be very urgent, owing to the time being too short before the departure of the post, to draw out a written statement, that condition is sometimes dispensed with. . . . . . If the under-secretary accedes to the application, he submits the case to the principal secretary of state, with whose approval a warrant is drawn by the head clerk of the domestic department under the instructions of the under-secretary, and is then signed by the principal secretary. A record of the date of the warrant is kept under lock and key, in a private book, to which the two under-secretaries and the above-mentioned head clerk have access. To the applicant information is given, according to circumstances, of the post-mark or address merely, or of the contents of the letters detained, or, if the case require it, the original letter is put into his hands. (2.) In the case of warrants of the second description, they originate with the Home Office. The principal secretary of state, of his own discretion, determines when to issue them, and gives instructions accordingly to the under-secretary, whose office is then purely ministerial. The mode of preparing them, and keeping record of them in a private book, is the same as in the case of criminal warrants. *There is no record kept of the grounds on which they are issued*, except so far as correspondence preserved at the Home Office may lead to infer them. . . . . . The letters which have been detained and opened are, unless retained by special order, as sometimes happens in criminal cases, closed and re-sealed, without affixing any mark to indicate that they have been so detained and opened, and are forwarded by post according to their respective superscriptions."[1]

---

[1] *Report from the Secret Committee on the Post-Office* (1844), p. 11.

[2] *Ricordi dei fratelli Bandiera e dei loro compagni di martirio in Cosenza* (Parigi, 1844), p. 47.

The committee of 1844 made no propositions for the regulation or control of this power. Its members content themselves with repeating the remark made a century before, as to the improbability that evil-intentioned persons, knowing that the secretary of state has occasionally recourse to the opening of letters, will venture to communicate their plans by post, but they make a different application of it. They acknowledge that, if this opinion be well founded, the importance of retaining the power as a measure of detective police is diminished. They suggest, however, that to withdraw the power would be to advertise "every criminal and conspirator against the public peace" that he may use the post-office with unhesitating confidence. They also suggest that to regulate the power might perhaps "have an indirect effect in giving an additional sanction to the power in question, and thereby possibly extending its use;"[2] with many other remarks of the like see-saw tendency. Our own clear conviction is, that the documentary evidence in this report is conclusive of the duty of the legislature to do at least these three things:—(1.) To enact that no warrant whatever shall issue except on written information upon oath; (2.) To enact that every such information shall be recorded in the secretary of state's office, with the date of the warrant, the period during which it remained in force, and *the results obtained.* (3.) To require a yearly statement of the number of warrants issued, and their respective grounds, with such reservations as to names and details as a wise discretion may dictate (without violating the spirit of the requirement), to be laid before Parliament. These precautions would, at all events, enable us to dispense with those platitudes about "deeply-involved British interests," and the like, which are better calculated for the meridian of Naples than for that of London.

History of the Money-Order Office.

No department of the post-office has advanced more rapidly of late years than has its "money-order office.' This branch of the business was for more than forty years the private enterprise of three post-office clerks, who were known as "Stow and Company." It was commenced in 1792, with the more especial object of facilitating the safe conveyance of small sums to soldiers and sailors, but was soon extended to all classes of small remitters, although still on a very humble scale. The postmaster-general sanctioned the scheme without interposing in the management. Each of the three partners advanced L.1000 to carry it on; and each of them seems, during the greater portion of the period, to have derived about L.200 a year in profit. In 1830 the amount of remittances from London was but about L.10,000.[3] The percentage was eightpence in the pound, out of which had to be defrayed the salaries of clerks, the commission to the country postmasters, and the profits of the partners. On the 6th December 1838 the office became an official department under the postmaster-general; the then partners receiving due compensation. The commission was reduced to a fixed charge of 1s. 6d. for sums exceeding L.2 and under L.5, and of 6d. for all sums not exceeding L.2. In 1840 these rates were reduced to 6d. and 3d. respectively. The number and aggregate amount of the orders issued in each year since the re-organization are as follows:—

Post-Office of Great Britain—Number and Amount of Money-Orders.

Years.	Number of Orders Issued.	Aggregate Amount of Orders Issued.
1839	188,921	313,124
1840	587,797	960,975
1841	1,552,845	3,127,507
1842	2,111,980	4,337,177
1843	2,501,523	5,112,840
1844	2,806,803	5,695,395
1845	3,176,126	6,413,361
1846	3,515,079	7,071,056
1847	4,031,185	7,903,177
1848	4,203,651	8,151,294
1849	4,248,891	8,152,643
1850	4,439,713	8,494,498
1851	4,661,025	8,880,420
1852	4,947,825	9,438,277
1853	5,215,290	9,916,195
1854	5,466,244	10,462,411
1855	5,807,412	11,009,279
1856	6,178,982	11,805,562
1857	6,389,703	12,180,273

The following table will show the amount of money-orders issued and paid in the principal towns of the kingdom, individually, in the year 1857:—

Post-Office of Great Britain.—Money-Orders Issued and Paid in Certain Towns.

Name of Town.	Population (1851).	Amount Issued.	Amount Paid.
		L.	L.
1. London	2,362,336	1,684,524	3,016,547
2. Liverpool	375,955	364,472	367,068
3. Manchester	316,213	278,506	380,550
4. Birmingham	232,841	182,744	305,661
5. Bristol	137,328	124,666	204,022
6. Newcastle-on-Tyne	87,784	100,018	84,879
7. Leeds	273,613	98.969	135,199
8. Sheffield	135,310	86,778	93.959
9. Hull	84,690	82,467	109,671
10. Nottingham	57,407	76,995	69,503
11. Portsmouth	72,096	74,466	62,541
12. Southampton	35,305	70,974	66,394
13. Bath	54,240	63,284	63,458
14. Plymouth	52,221	62,395	64,936
15. York	40.359	54,446	56,279
16. Cheltenham	35,051	52,499	41,562
17. Wolverhampton	119,748	50,355	33,919

7. Drogheda	16,876	5,338	7,878				

In 1848 the money-order office involved a loss of L.5,745 by excess of expenses over the amount of poundage. In 1849 a profit accrued of L.322, which has gradually increased, year by year, until in 1857 it amounted to L.24,175.

History of the postal revenue from 1839 to 1857.

The increase in the number of postal deliveries, and in that of the receiving-houses and branch-offices, together with the numerous improvements introduced into the working economy of the post-office, when Mr Rowland Hill at length obtained the means of fully carrying out his reforms by his appointment as secretary, speedily gave a more vigorous impulse to the progress of the nett revenue than had theretofore obtained. During the seven years, 1845–51 inclusive, the average was but L.810,951. During the seven years, 1852–57 inclusive, the average was L.1,166,448. The following table shows the details for the entire period from 1838, the last complete year of the old rates of postage, to 1857 inclusive:—

Post-Office of Great Britain.—Number of Letters; Gross and Nett Income, 1838–57.

Summary of progress, 1839–57.

Briefly, under the penny rate the number of letters has become *sixfold* what it was under the exorbitant rates of 1838. When the change was first made the increase of letters was in the ratio of 122·25 per cent. during the year. The second and third years showed an increase on each preceding year respectively of about 16 per cent. During the next fourteen years the average increase was at the rate of about 6 per cent. per annum; and this rate is still maintained. And although this enormous increase of business, coupled with the increasing preponderance of railway mail conveyance, invaluable but costly, has carried up the post-office expenditure from L.757,000 to L.1,720,000, yet the nett revenue of 1857 is within L.300,000 of the nett revenue of 1839. These are the direct results. The indirect advantages which have attended postal reform are beyond calculation.

During the year 1857 the number of newspapers delivered in the United Kingdom was about 71,000,000; and that of book packets (the cheap carriage of which is one of the most serviceable and praiseworthy of the recent improvements) about 6,000,000.

Under this head it only remains to show, as concisely as possible, the extent of postal correspondence between Great Britain and the principal British colonies and foreign countries, individually. The following table, for the year 1856, will afford this information as nearly as it is yet attainable:—

Post-Office of Great Britain.—Statistics of Colonial and Foreign Correspondence, 1856.

Name of Colony or State.	Letters Outwards.	Letters Inwards.	Letters Inwards and Outwards.	Newspapers and Books Outwards.	Newspapers and Books Inwards.	Newspapers and Books Inwards and Outwards.
African, West Coast of	28,800	22,836	51,636	22,884	4,632	27,516

[1] Miles, *History of the Post-Office*, ut supra, 349.

British Post-Office.

II. ORGANIZATION AND MECHANISM OF THE BRITISH POST-OFFICE.

The principal acts which regulate the management of the post-office of the United Kingdom, are those of 1 Vict., c. 32–36, "An Act to Repeal the several Laws relating to the Post-Office;" "An Act for the Management of the Post-Office;" "An Act for Consolidating the Laws relative to Offences against the Post-Office," &c.; and 2 Vict., c. 98, "An Act to provide for the Conveyance of the Mails by Railways;" 3 and 4 Vict., c. 96, "An Act for the Regulation of the Duties of Postage;" 7 and 8 Vict., c. 49, "An Act for the better Regulation of Colonial Posts;" 10 and 11 Vict., c. 85, "An Act for giving further facilities for the Transmission of Letters by Post, and for the Regulating the Duties of Postage thereon, and for other purposes relating to the Post-Office;" and 11 and 12 Vict., c. 88, "An Act for further Regulating the Money-Order Department of the Post-Office." The briefest possible analysis of these acts would claim a large space. It must here suffice to enumerate the existing staff and expenditure; to indicate the chief branches of the office, and its methods of working; and to detail the principal regulations which concern the public in the practical business of correspondence.

Staff of the post-office.

On the 31st December 1857 the entire staff of the post-office comprised 23,731 persons of all ranks. Of this number, 23,545 were employed in the British Isles, 125 in the colonies, and 61 in foreign countries as agents for the collection of postage, &c. Of the 23,545, about 2000 were attached to the chief office in London. Exclusive of the letter-carriers, they may be classified thus:—

Post-Office of Great Britain.—Staff of Chief Office, 1858.[1]

	No. of Persons.
Postmaster-general	1
Secretary and assistant secretaries	3
Private secretary to postmaster-general	1
Secretary's office,— 1 chief clerk; 51 clerks (in three classes); 20 supplementary clerks; 4 paper-keepers	76
Surveyors' department,— 13 surveyors; 25 clerks; 13 stationary clerks; 38 clerks in charge	89
Mail office,— 1 inspector-general; 1 deputy inspector-general; 1 chief clerk; 13 clerks; 3 inspectors of mails; 1 supervisor of mail-bag apparatus	26
Railway department of mail-office,— 1 superintending clerk; 60 clerks	61
Solicitor's office,— 1 solicitor; 4 clerks; 1 inspector-general	6
Medical department	2
Receiver and accountant-general's office,— 1 receiver-general; 1 chief examiner; 1 cashier; 1 book-keeper; 48 clerks	52
Money-order office,— 1 comptroller; 1 chief clerk; 149 clerks	151
Circulation department,— 2 comptrollers; 10 deputy do.; 219 clerks; 1 inspector-general of letter-carriers; 35 inspectors; 3 officers in charge of Indian mails; 1 surveyor; 3 surveyor's clerks	274

Inland service.

The number of post-offices in the United Kingdom, on the 31st December 1857, was 11,101. Of these, 810 were head post-offices, and 10,291 sub-post-offices. The number of street and road letter-boxes was 703. The distance over which mails are daily conveyed within the United Kingdom is, in the aggregate, 129,480 miles: of which distance, 30,172 miles are performed by railway, at an average charge of 9¼d. per mile; 32,997 by coach, omnibus, or mail-cart, at an average of 2⅓d.; 63,432 on foot, at an average of 1½d.; and 2879 miles by packet and boat, at maximum charges varying from 5s. 6¼d. in England, to 5¼d. in Ireland, per mile. The details are thus stated:—

Post-Office of Great Britain—Conveyance of Mails, 1857 (*Inland Service*).[2]

Countries.	Mails Conveyed by Railways.		Mails Conveyed by Coaches.		Mails Conveyed on Foot.		Inland Mails Conveyed by Packets and Boats.		
	No. of Miles per Week-day.	Average Charge per Mile.	No. of Miles per Week-day.	Average Charge per Mile.	No. of Miles. per Week-day.	Average Charge per Mile.	No. of Miles per Week-day.	Maximum Charge.	Minimum Charge.
England	23,620	0s. 8¼d.	19,097	2½d.	46,643	1½d.	1451	5s. 6¼d.	⅛d.
Ireland	2,850	1s. 4d.	8,603	2d.	6,721	1d.	52	0s. 5¼d.	¼d.
Scotland	3,702	0s. 10⅛d.	5,297	2¼d.	10,068	1½d.	1376	1s. 1¾d.	⅓d.
United Kingdom	30,172	0s. 9¼d.	32,997	2⅓d.	63,432	1½d.	2879	5s. 6¼d.	⅛d.

The post-office expenditure for 1857 was as follows:—

Post-Office of Great Britain.—Expenditure, 1857.

Heads of Service.		Amount in 1857.	Amount in 1856.
		L.	L.
1. Salaries, pensions, &c.		948,573	909,094
2. Hereditary pensions by statute		1,573	29,310
3. Buildings		29,367	33,330
4. Conveyance of mails—			
By railways	L.422,943		
By coaches, &c.	167,823		
By mail packets and private ships	12,298		
		603,064	553,509
5. Manufacture of postage stamps, &c.		28,566	26,164
6. Rents, taxes, clothing expenses, law expenses, and miscellaneous expenses		109,672	108,822
		1,720,815	1,660,229[3]

The fifth item in this abstract—"Manufacture of postage stamps"—has been of late years reduced (relatively to the number consumed), and the process much improved, by the perforating machine invented by Mr Henry Archer, and purchased of him for the public, in pursuance of the recommendation of a select committee of the House of Commons which sat in 1852. That committee reported its inability to decide on the conflicting evidence which had been offered to it, "as to the greater or less security against forgery afforded by copper-plate engraving than by surface printing; but it adopted the opinion which had been previously expressed by the Commissioners of Inland Revenue, "that the application of the perforating machine would afford additional security against forgery, inasmuch as the accurate perforation of counterfeit sheets would be a work of great difficulty, and sheets not accurately perforated would at once excite suspicion if offered for sale."[4]

The item "Salaries and pensions" is necessarily, and wisely, an increasing one. As respects a large proportion of the staff, there is an annual increment of salary, and an annual expenditure in defraying the cost of substitutes during the absence of the officers on their regular holiday, or on account of ill health. On this recently-established practice of annual vacations there is an instructive passage in a report addressed in 1857 to the postmaster-general by Mr Bokenham, comptroller of the circulation department:—"The attendance of the clerks during the year," writes this officer, "has been good, and an improvement has shown itself in their general health. This is highly satisfactory, and the decreased amount of absence from illness may, I think, greatly be traced to the good effects the annual holiday has produced upon them, in the temporary relaxation which it gives from their labours. The Saturday half-holiday, too, has not been without its influence. The duty certainly has not suffered by the establishment of that measure. Both for the ordinary business of the week, and for any extra work that has required to be done (and in the district branch the pressure has been very great), the officers have cheerfully attended beyond the regular official hours, in order that no arrears might accrue. The privileges are felt to be most valuable, and every effort will be made by the officers to retain them."

Railway post-offices.

No improvement of detail has tended more importantly to accelerate the delivery of letters than has the establishment of "railway post-offices,"—now a familiar sight, although still a subject of public curiosity as to their methods of working. By Mr Ramsay's ingenious apparatus, letter-bags are dropped into a net attached to the official carriage, without checking the speed of the train, and their contents are rapidly assorted into the range of boxes or "pigeon-holes" appropriated to the respective towns on the line, and thence into the proper bags, which in many cases are left, as they were received, whilst the train continues at full speed. Plans for sorting letters on board ship were long impeded by technical difficulties; but in 1857 these were surmounted, and the object was successfully attained in the packets which convey the Australian mails between Alexandria and Southampton. It has since been adopted in other lines of packets, and will doubtless become general.

Acceleration of postal deliveries.

By the new arrangements for sorting letters on their journey, and by other improvements in postal economy still more recent, a remarkable acceleration has taken place in the deliveries in almost all parts of the kingdom, as well as in London. The extent of this acceleration in the metropolis will be briefly and strikingly shown by the following percentage table:—

Post-Office of Great Britain.—Acceleration of Metropolitan First Morning Delivery, 1856–58.

Delivery completed	First Six Weeks of 1856. (Delivery commenced 7.55 A.M.)	First Six Weeks of 1857. (Delivery commenced 7.28 A.M.)	First Six Weeks of 1858. (Delivery commenced 7.4 A.M.)
A.M.	Per Cent.	Per Cent.	Per Cent.

	100	100	100

The cities and towns of the United Kingdom which yield a postal revenue next in importance to that of the English metropolis are Liverpool, Manchester, Glasgow, Dublin, Edinburgh, Birmingham, and Bristol. The details in the years 1856 and 1857 were respectively as follows. The staff and local expenses are those of 1854:—

Post-Office of Great Britain.—Local Statistics, 1856–57.

Cities and Towns.	Population in 1851.	No. of Clerks, Receivers, &c.	No. of Letter-Carriers.	Local Expenses.	Postal Revenue.	
					1856.	1857.

The metropolitan offices of Scotland and Ireland.

During the inquiry into the organization of the post-office which was instituted by the Treasury in 1854, a proposition was brought under consideration for discontinuing the metropolitan offices at Edinburgh and Dublin, and placing the Scottish and Irish business immediately under the central office. But it was clearly established, on careful investigation, that the proposed change was an undesirable one, for these reasons amongst others:—(1.) The management of remittances and accounts requires that receivers should be stationed in Edinburgh and in Dublin respectively; (2.) A dead-letter office is requisite in those capitals, inasmuch as the delay of transmission to London and the probable deficiency of local knowledge at the chief office would be alike prejudicial to the public service. (3.) The existing plan admits of the settlement of many questions arising in the ordinary course of business more expeditiously, and therefore more satisfactorily, than could be effected in London.[1]

Rules as t appointments in the post-office service.

On the general question of appointments in the service of the post-office, the Treasury committee of 1854 reported its opinion "that the postmaster-general should lay down strict rules for the examination of all candidates for admission, either into the class of clerks, or into that of sorters and letter-carriers, in order to test their capacity; . . . . that the limits of age for admission should be seventeen and twenty-three, in the case of all candidates for letter-carrierships, sorterships, or clerkships, who have not previously been in the service of the department;" and that "a medical examination should also take place in order to ascertain that the candidate has no physical or mental defect or disease which is likely to incapacitate him for the public service." They also proposed that the appointment of local postmasters should be transferred from the Treasury to the postmaster-general. Many other changes and rearrangements were recommended, which it is not needful here to notice.

Most of the recommendations of the committee received the approval both of the Lords of the Treasury and of the

---

[1] *Report* [to the Treasury] *upon the Post-Office* (1854), pp. 33–35.

Treasury minute on the report of 1854.

postmaster-general, and have been carried into effect. But, on the proposed limit of age for admission to the service of letter-carriers and sorters, the Treasury minute observed that it was too low:—"My lords advert first to the trustworthy character of the duty, requiring, at least, considerable steadiness of character and habits, which may not be easily secured at so early an age; and they also advert to the fact, that the limit of age for admission into other parts of the public service for which the officers are drawn from similar classes of society, and where the duties are not of a character requiring so much trust, extends to the age of thirty. My lords are therefore of opinion that it is desirable that a latitude should be given to the postmaster-general in the selection of this class of officers up to the age of twenty-seven.

"The only other point in the report," continues the minute, "which my lords desire to modify is that which proposes to transfer the appointment of local postmasters from this board to the postmaster-general. My lords entirely concur with the committee that it would be beneficial to the public service, and advantageous to the post-office department, that the postmaster-general should have an opportunity of rewarding meritorious servants by promoting postmasters to more important towns where vacancies occur, and by appointing deserving officers in country post-offices, as well as in the chief office in London, to the charge of local post-offices. But it appears to my lords that this principle can only be applied with advantage to a class of post-offices where, from their importance and the amount of the emolument, the office is held as a separate and distinct employment, and that it would be inapplicable in all cases where the post-office is held in conjunction with a private business or profession, in which case it is obviously necessary that the appointment must be conferred upon a local person. In the latter cases, my lords are of opinion that it is for the public interest that the appointments should continue to be made as at present, after consulting, through the recommendation of the member for the county or town, the convenience and wishes of the population." For these reasons it was decided that the Treasury should continue to appoint provincial postmasters in places where the nett income shall not exceed L.175 a year, and that in all other cases the appointment shall lie with the postmaster-general.

Existing rates of postage.

The existing rates of postage and public regulations of the department stand thus (February 1859):—

1. *All inland letters must be paid in advance by postage stamps*, as follows:—For a letter weighing not more than ½ oz., 1d.; more than ½ oz., but not exceeding 1 oz., 2d.; more than 1 oz., but not exceeding 2 oz., 4d.; more than 2 oz., but not exceeding 3 oz., 6d.; and so on, 2d. being charged for every additional ounce. Inland letters which are posted *wholly* without stamps are returned to the writers. This compulsory regulation came first into operation on the 10th February 1859.

2. If insufficiently stamped, the deficient postage is charged with an additional rate of one penny. Thus, an inland letter, weighing more than half an ounce, but not more than an ounce, and bearing a single stamp, is charged twopence. But in the case of letters which have to be *re-directed*, the unpaid additional postage is charged at the ordinary rate. Unless three-quarters at least of the postage of a letter *exceeding four oz.* be prepaid, the letter is not forwarded.

etitions.

3. *Petitions* and *addresses* to her Majesty, forwarded direct, are exempt from postage; and such petitions and addresses, as also petitions to either House of Parliament, if sent to a member of either house, are also exempt, provided they do not weigh more than 2 lb., and are without covers, or in covers open at the sides or at the ends.

ewspa- rs and riodicals.

4. All *periodical publications*, including *newspapers*, published in the United Kingdom, at intervals not exceeding thirty-one days, and which bear an impressed stamp denoting stamp-duty of the value of 1d. at least, may be transmitted and re-transmitted through the post free of postage; but the stamp must be exposed to view; the cover must be open at the ends; it must contain no inclosure or writing of any kind; and, in case of a second transmission, the previous address, if written on the paper, must be cut off. For transmission abroad newspapers must be registered at the post-office, and the postage must be prepaid in postage stamps; the impressed stamp counts for nothing beyond the British Isles.

Parliamentary papers

5. *Parliamentary papers*, open at the ends, are carried within the United Kingdom at the rate of 1d. for every 4 oz. or fractional part thereof, whether prepaid or not; but they must be marked "parliamentary proceedings" on the cover.

Book-packets.

6. *Book packets*, open at the ends or sides, are charged at the like rate of 1d. for 4 oz., and 2d. not exceeding 8 oz.; but the rate proceeds by half-pounds, 2d. being charged for 8 oz., or fractional part of 8 oz. A book packet may contain any number of separate books or other publications (including *printed* letters and printed matter of every kind), prints, or maps, and any quantity of paper, parchment, or vellum. And the books, &c., may be either printed, written, or plain, or any mixture of the three. All legitimate mounting, binding, or covering, is allowed, as also rollers in the case of prints or maps; but no book packet may contain any letter or communication in the nature of a letter otherwise than wholly *in print*, nor anything which is sealed or otherwise closed against inspection, nor must it exceed 2 feet in length, width, or depth.

Registration.

7. *Registration* of inland letters or book packets may be made by the prepayment in stamps of a fee of 6d., in addition to the ordinary postage. Such registration makes it practicable to trace a letter from receipt to delivery. A receipt must be obtained by the sender at the post-office window, and a receipt is required from the receiver by the letter-carrier on delivery.

Responsibility of the post-office.

It is held by the post-office authorities that even registration does not render the postmaster-general responsible to the sender, but leaves intact the old legal doctrine, that the responsibilities of common carriers do not extend to postmasters, as was decided in the case of *Lane* v. *Cotton*. The post-office establishment is regarded as a branch of the public police, created by statute, and controlled by the government. Postmasters enter into no contract with individuals, and receive no hire, like common carriers, in proportion to the risk and value of the letters under their charge, but only a general compensation from government. The same doctrine was asserted in the case of *Whitfield* v. *Lord Le Despencer*, which was an action to recover the value of a bank-note stolen by one of the sorters out of a letter in the post-office. But a deputy-postmaster is answerable in a private suit for individual acts of misconduct or negligence, as for wrongfully detaining a letter an unreasonable time. And all subordinate officers are responsible to the postmaster-general, who may require them to make good to the sufferers any loss sustained through their neglect or breach of duty.[1]

Parliamentary notices

8. *Parliamentary notices* may be forwarded by post if posted at such offices as transact money-order business. The postage and the registration fee of 6d. on each must be prepaid either in money or stamps. The words "parliamentary notice" must appear legibly on each, and with them must be presented lists in duplicate to be examined at the post-office window.

Colonial letters.

9. For *Colonial letters*, 6d. the half-ounce. This rate now extends to every British colony or dependency. To the following places prepayment is optional:—Bermuda, Canada, Cape Coast Castle, Cape of Good Hope, Ceylon, Gold Coast, Ionian Islands (at an advanced rate), New Brunswick, Newfoundland, Nova Scotia, Prince Edward Island, Sierra Leone. To all others it is compulsory.

Foreign letters.

10. For *Foreign letters* the rates are too numerous for much detail. To France the rate is 4d. per *quarter*-ounce, if prepaid; double, if not prepaid. To Belgium, to most parts of Germany *via* Belgium, to Holland, 8d. per *half*-ounce; to Sardinia *via* France, and to Spain, 6d. per *quarter*-ounce; to the Papal States, to Greece, and to Naples, 11d. per *quarter*-ounce; to the United States, 1s. the half-ounce, and so on.

Foreign newspapers and book-packets.

11. To Belgium, France, Algeria, to Prussia *via* France, and to the French offices in Turkey, Syria, and Egypt, registered newspapers are conveyed at the rate of 1d. for 4 oz., 2d. for 8 oz., and 2d. for every additional 8 oz., or fractional part thereof. Other printed papers are 3d. for 4 oz., 6d. for 8 oz., and 6d. for every additional 8 oz., and so on. Prepayment is compulsory. To Sardinia, Spain, the Balearic and Canary Islands, the

---

[1] See the cases Lane *v.* Cotton in Lord Raymond's *Reports*, i. 646; Whitfield *v.* Lord Le Despencer in Cowper's *Reports*, 754; and Browning *v.* Goodchild, in Wilson's *Reports*, iii. 443.

rates for registered newspapers are double the above. To Tuscany, Parma, Modena, and the Austrian dominions, they are quadruple, *i.e.*, 4d. for 4 oz., and 8d. for every 8 oz., or fractional part thereof. Book packets are—to Sardinia, &c.,—4d. for 4 oz., 8d. for 8 oz., and the like for every additional 8 oz. But no packet of books or newspapers can be sent to the Austrian dominions *via* Sardinia, if it weigh more than 1 lb.

12. The term "printed papers," as applied to foreign countries, includes parliamentary proceedings, books of all kinds (whether printed, engraved, or lithographed), sheets of music, prints, maps, and every thing necessary for the safe transmission of such; but must contain no writing of any sort, except in the single case of transmission to Sardinia, where writing, not of the nature of a letter, is permitted, as in the United Kingdom; and no packet must exceed 18 inches in length, width, or depth, unless it be addressed either to Sardinia, Spain, Balearic or Canary Islands, Tuscany, Parma, Modena, or the Austrian dominions, in which countries the limit is 24 inches. But *bound* books cannot be sent to Spain or the Balearic or Canary Islands; neither can prints, music, maps, nor drawings, unless they form part of a book. The United States have not yet attained a book-packet rate, except for periodicals under 16 oz. weight, at 1d. for 2 oz., 6d. for 3 oz., and 2d. for every additional ounce. Pamphlets under 8 oz. may be sent at the same rate.

Colonial book-packets.

13. *Colonial book packets* may be transmitted at the rate of 3d. for every 4 oz. Newspapers are 1d. each. Newspapers for India weighing above 4 oz., and not exceeding 8 oz., are chargeable with two single rates; above 8 oz., and not exceeding 21 oz., with three single rates. The book post to and from India and New South Wales is limited to packets not exceeding 3 lb. in weight; any packet weighing more than 3 lb. is liable to the letter rate. In all other respects the regulations were assimilated in 1857 to those of the inland book post.

Registration of colonial and foreign letters and packets.

14. By the prepayment of the ordinary postage and the British registration fee of 6d., letters, newspapers, and book packets can be registered, irrespective of weight, between this country and the British West Indies, British North America, Sierra Leone, Gold Coast, St Helena, Cape of Good Hope, Natal, Mauritius, South Australia, Western Australia, Malta, Gibraltar, and Ceylon. Letters may on the same terms be registered to Belgium, Luxemburg, Holland, and countries through Holland, Sardinia, Spain, the Balearic or Canary Islands, the United States, Alexandria, Suez, India, and Liberia. By the prepayment of a fee of 9d., in addition to the usual postage, letters, &c., irrespective of weight, may be registered to Prussia, and to countries to which correspondence is usually sent through Belgium. In like manner, for a fee of 11d., letters, &c., may be registered to Tuscany, Parma, Modena, and Venetian Lombardy; and for *double postage*, letters may be registered to France, and to countries, the correspondence of which is, as a rule, sent through France, and can be paid to destination.

Returned or "dead" letters.

15. When letters, &c., remain undelivered, owing to the residences of the persons to whom they are addressed being unknown, a list of the addresses is exhibited in the window of the post-office to which they have been sent during one week. "Refused" letters are sent as soon as possible to the "returned letter office," as are all letters intended for ships which have sailed before their arrival. When the reason is "not known," or "gone away," the letter is retained by the provincial postmaster, for a period not exceeding fourteen days, before being sent to the "returned letter office;" and when the reason is "not called for" (the letter being addressed to a post-office), the letter is retained for a month. Undelivered letters from the country to London are retained for three days in the "letter-carriers office," and then sent to the "returned letter office," whither London district letters go on the second day after the unsuccessful attempt to deliver them. All inland letters which contain the name and address of the senders are returned to them on the day of their receipt at the "returned letter office." Colonial and foreign letters are returned in periods which vary from one month to two months. Letters which contain no address of the sender are destroyed, unless they contain money or other articles of value.

[The number of letters so returned to the writers during 1857 was about 1,700,000, as against 1,581,000 in 1856. The number of newspapers which could not be delivered during 1857 was about 580,000.[1]]

Re-directed letters.

16. *Redirected letters* are usually chargeable with additional postage at the prepaid rate, unless they be re-directed by an officer or servant of the post-office, and be so re-directed to a place within the district of the same head-office. A registered letter, when redirected is subjected to the ordinary rate.

Money order business.

17. Application forms for *money-orders* may be obtained at the rate of ten for a penny. The commission is 3d. on an order not exceeding L.2; 6d. above L.2. No order is granted for more than L.5. Unless the remitter shall notify, in writing, that the order is to be paid through a bank, the person applying for it at the office must furnish the surname, and at least the initial of one Christian name, both of remitter and of payee, together with the remitter's address. Applicants for money-orders are cautioned not to transmit the information required on payment in the same letter with the order. After once paying an order, by whomsoever presented, the office is no longer liable. Presentation must be made before the end of the *second* calendar month after the month of issue. If made later, a new order and new commission are required. If not paid before the end of the *twelfth* calendar month after issue, all claim to the money will be lost.

Penalties for offences against post-office acts.

18. *Penalties* of L.5 for conveying any letter otherwise than by post, and of L.100 for every week during which the practice of such conveyance is continued, are enacted by 1 Vict., c. 36, sec. 2. The sender also incurs a penalty of L.5 for every letter, with full costs of suit. The exceptions (by 1 Vict., c. 34) are these:—(1.) Letters by a private friend; (2.) Letters by an express messenger on the personal affairs either of sender or of receiver, and proceedings of courts of law; (3.) Letters sent out of the United Kingdom by private ships; (4.) Letters of merchants and of owners of vessels or cargo, sent by such vessels without reward or profit for such conveyance; (5.) Letters expressly relating to and accompanying merchandise sent by common carriers. Provided always that no *collection* be made of any such excepted letters.

19. The following persons are expressly forbidden to carry letters, either with or without hire or reward:—(1.) Common carriers, except as above; (2.) Owners or commanders of ships, except as above; (3.) Passengers, or other persons on board ships or other vessels; (4.) Owners of, or any persons whatsoever conveyed by, any ship or boat passing on a river or navigable canal, within the United Kingdom.

III. HISTORY AND MECHANISM OF THE POST-OFFICE OF THE UNITED STATES OF AMERICA.

Benjamin Franklin was the first postmaster-general of the United States, but he very soon vacated the office on being appointed ambassador to France. From November 1776 to November 1858, the office has been held by nineteen persons.

From 1776 to 1816 the rates of postage varied from 7 to 33 cents (3½d. to 1s. 4d.) according to distance: reductions of slight extent were made in 1816, and again in 1845. In 1851 Congress established the following rates:—For "drop" or local letters, 1 cent (½d.); letters not exceeding ½ oz., for any distance not exceeding 3000 miles, 3 cents (1½d.), if prepaid; five cents (2½d.), if not prepaid; and double those rates for letters of like weight if conveyed more than 3000 miles. The existing law, enacted in 1855, and carried into full effect on the 1st of January 1856, fixed the rates at ½d. for local letters, 1½d. for single letters if under 3000 miles, 5d. if above 3000 miles; made prepayment compulsory; and directed that unpaid letters should be stopped and sent to the "Dead-Letter Office." It was further enacted, that from the date last named the prepayment should be by stamps. By another law of March 1856, prepayment was extended to printed matter. Under this compulsory system upwards of a million of unpaid letters were detained, not returned to the writers as in this country,—and sent to Washington, where they were *destroyed*. The same practice is pursued with respect to all letters refused or undelivered, from whatever cause. It leads, according to the testimony of the able historian of the American post-office, Mr Pliny Miles, to the destruction of about 4,000,000 of letters annually.

On the same authority (but in a much abridged form), the statistics of the American postal system for the last seventy years may be stated thus:—

---

[1] *Fourth Report,* ut supra, 18.

Statistics of American post-office.

Post-Office of the United States.—Statistics, 1790–1856.

Year.	No. of Post-Offices.	Miles of Post Road.	No. of Letters.	Expenses of Conveyance.	Total Expenses.	Revenue.
				L.	L.	L.
1790	75	1,875	265,545	4,416	6,428	7,587
1795	453	13,207	1,124,340	15,071	23,578	32,124
1800	903	20,817	1,965,628	25,728	42,798	56,160
1805	1,558	31,076	2,949,651	47,927	75,473	84,274
1810	2,300	36,406	3,861,788	65,593	99,193	110,366
1815	3,000	48,966	7,301,455	97,555	149,624	208,613
1820	4,500	72,492	8,895,415	145,685	231,185	222,385
1825	5,677	94,052	10,016,488	157,129	241,316	250,412
1830	8,450	115,176	13,804,664	254,801	386,541	370,116
1835	10,770	112,774	26,942,013	343,801	551,470	598,711
1840	13,468	155,739	40,891,698	642,608	943,547	908,704
1845	14,183	143,940	39,958,978	579,726	864,146	887,968
1850	18,417	178,672	69,426,452	619,194	1,042,590	1,110,594
1855	24,410	227,908	126,723,425	1,215,267	1,993,668	1,577,035
1856	25,565	239,642	131,450,409	1,353,127	2,081,573	1,524,164[1]

The total number of mail routes on the 30th June 1856 was 7972, and the number of contractors 6372. The aggregate length of routes, and annual amount of transportation stood thus:—

Post-Office of the United States.—Statistics of Transit, June 1856.

Mode of Transit.	Length of Routes.	Annual Transportation.	Cost per Mile.
	Miles.		
By steamboat	14,951	4,240,170	10d.
By railway	20,323	21,809,296	5⅛d.
By coach	50,453	19,114,991	3½d.
By other methods of transit...	153,915	26,143,440	2½d.
Totals......	239,642	71,307,897	...

The income and expenditure of the post-office of the United States, during each of the years 1855 and 1856, were respectively as follows:—

Post-Office of the United States.—Income and Expenditure, 1855–56.

Headings of Expenditure.	1855.	1856.	Income.	1855.	1856.
	L.	L.		L.	L.
Salaries and wages	596,253	604,777	Gross Income	1,482,366	1,524,164
Conveyance of mails	1,215,267	1,353,128			
Miscellaneous expenses, including packet service, and balances due to foreign offices...	197,479	123,668	Deficiency to be provided for by votes of Congress..........	526,633	557,409
Total...............	2,008,999	2,081,573	Total..............	2,008,999	2,081,573

Causes of the deficiency of income to meet expenditure in United States post-office.

An annual deficiency of half a million is a result so strikingly in contrast with British postal experience, that it may well claim some elucidation. Its true causes, and the lesson they convey, have been brought saliently before the American public by the indefatigable advocate of Transatlantic post-office reform, Mr Pliny Miles. On one important point, his views and those expressed in the report of the postmaster-general (then Mr James Campbell) for the year 1856 are in harmony. Both agree in condemning the extent to which the franking privilege is carried in the United States. Both recommend its abolition. On most other points of postal affairs they are greatly at variance.

Mr Campbell's report, after referring to previous expressions of his official disapproval of the continuous increase of franking, proceeds thus:—"The experience of the last year has satisfied me more fully that this privilege should be speedily abolished. For months during this year free matter by the ton passed through the mails into every part of the United States, interfering greatly with the regular transmission of the correspondence of the country. When this free matter passes from the railroad, it is almost impracticable to forward it by the ordinary conveyances. The evil is yearly increasing, detracting largely from the revenues of the department, and impairing its efficiency." . . . "The reduced rates of postage having largely reduced the revenue, it has not been possible to confine the expenditures of the department within its income, and the postmaster-general has been compelled to apply to Congress annually to appropriate the deficiency from the general treasury. These causes have removed in effect the salutary restraints imposed by the act of 1836, and left the head of this department in a great degree uncontrolled in his expenditures. This state of things should not continue. The laws should be so framed as to produce a sufficient amount of revenue to defray all proper expenditures. If my views regarding the abolition of the franking privilege . . . be not adopted[2] [be adopted ?] by Congress, I would recommend the passage of a law enabling the department to charge the ordinary rates of postage on letters and printed matter which now pass free through the mails. If, in addition to this, the clause in the act of the 30th of August 1852, allowing a deduction of 50 per cent. on newspapers and periodicals, when paid quarterly or yearly in advance, be abolished, as recommended in my last two annual reports, and the department be relieved from the expense of ocean mail-steamships and isthmus service, it would, with a proper economy, soon sustain itself."[3]

In 1854 there was laid before the Post-Office Committee of the House of Representatives a report from the postmaster of Washington of the weight of the letters, newspapers, and official documents posted in that city, under franks, within one ordinary month,—that of January 1854. It ran thus:—

Nature of Matter transmitted.	Weight in One Month.	Amount of Postage, if charged at usual rates.		
	lb.	L.	s.	d.
Letters from members of Congress...	3,446	932	16	0
Documents from do. do.	693,508	22,192	4	0
Letters from departments of State ...	7,065	1,356	8	0
Newspapers	111,002	2,220	0	0
Total for one month.........	815,021	26,701	8	0

According to this return, the franked matter transmitted outwards, from Washington alone, would amount in a year to about 5000 tons, and its postage, at ordinary prepaid rates, to upwards of L.320,000. Taking this as a datum, the postage of the whole of the matter so transmitted throughout the Union cannot be fairly estimated at less than L.500,000 a year on the average. The amount actually appropriated by Congress to cover this expenditure has, during the last ten years over which the official reports extend, averaged but L.112,535. If to this fact it be added that the entire influence of the post-office functionaries at Washington has been exerted for seventeen years to keep up the rates of postage as much as possible, and, when concessions became inevitable, to make those concessions as small in extent and as imperfect in their practical working as they could be made, further explanation or hypothesis as to the causes of the annual deficit become quite needless.

[2] So the passage reads as printed in the official document.

[3] *Report of the Postmaster-General of the United States*, Dec. 1, 1856, printed in the documents appended to the President's Message of Dec. 2, ii. 771.

The postal statistics of the United States compared with those of Great Britain.

The extent to which the natural development of postal correspondence, amongst such a population as that of the American Union, is checked by bad methods and insufficient facilities, cannot be more strikingly displayed than by contrasting the postal statistics of Great Britain with those of the United States. Those statistics show that the ratio of letters annually passing through the post to the total population of the country is nearly five times as high in Britain as it is in America; and that the population of London alone sends by post a greater number of letters than does the whole population of the Union. The details of the ten years, 1847–56 inclusive, are as follows:—

British and American Post-Offices.—Comparative Numbers of Letters, 1847–56.

Year.	London Local Letters.	London Mail Letters.	Total of London Letters.	Total of Letters in Great Britain.	Total of Letters in U. States.
1847......	34,630,817	43,757,540	78,388,357	322,146,243	47,585,757
1848......	33,672.747	45,991,153	79,663,900	328,830,184	52,364,819
1849......	33,960,398	45,845,683	79,806,081	337,399,199	60,159,862
1850......	38,887,844	44,856,170	83,744,014	347,069,071	69,426,452
1851......	40,585,952	47,819,499	88,405,451	360,647,187	83,252,735
1852......	40,403,207	51,171,423	91,574,630	379,501,499	95,790,524
1853......	42,816,314	54,402,023	97,218,337	410,817,489	102,139,148
1854......	46,191,569	57,186,159	103,377,728	443,649,301	119,634,418
1855......	45,844,963	59,647,549	105,492,512	456,216,176	126,723,425
1856......	47,894,708	64,961,321	112,856,029	478,393,803	131,450,409
Total of 10 years	404,885,519	515,638,520	920,527,039	3,864,670,152	888,527,549

In no particular is the defective character of the American system more apparent than in its treatment of the local correspondence of towns. In none does that system contrast more unfavourably with our own. Whilst in Britain local letters yield a considerable proportion of the nett revenue of the post-office, the larger share of their transmission in the United States is left in the hands of private persons. The law which prohibits the carriage of letters by individual enterprise between New York and Philadelphia, and punishes it with heavy penalties, permits any speculator to establish a private post-office in either of these cities, provided its operations do not extend beyond the municipal limits. Mr Miles thus describes the operations of the "two that do the largest business" in New York:—"One," he says, "employs 45 letter-carriers, has over 2000 receiving-boxes where letters can be deposited in various parts of the city; and collects and delivers, *or deposits in the city post-office for the mails*, from 6000 to 15,000 letters daily. In one day . . . there passed through his hands, he tells me, in collecting and delivering, 164,000 letters. This was the largest day's work he ever did. Another tells me he employs 25 letter-carriers, lets 350 boxes in his private post-office at a rent of four dollars each, and collects and delivers an average of 10,000 letters a day. There are three or four other private post-offices . . . in the city."[1] This system is, as might be anticipated, attended by much irregularity and insecurity. Nor are its disadvantages in any material degree compensated by the extensive and provident facilities which mercantile enterprise and competition usually bring in their train. The greatest cities of the United States are still in arrear of our second-rate towns, as respects both the number and conveniency of receiving-houses and the frequency of letter deliveries.

Improvements needed in the United States post-office.

In brief, it may be said that the chief deficiencies which need to be supplied in the American postal system are these:—(1.) An equitable compensation for the service rendered to the government and nation in the transmission of official correspondence and public documents, so regulated as to admit of plain and exact account-keeping, which is wholly unattainable under the existing system of franks; (2.) Low and uniform rates of postage, graduated according to weight, and by a broad not minute or fractional scale; (3.) An ample provision of receiving-houses in the cities and great towns, more frequent and punctual deliveries, and abolition of private post-offices; (4.) A book post, at low rates and with liberal regulations; (5.) A money-order system of like character; (6.) A "returned letter office," in place of the present discreditable method of destroying all correspondence remaining undelivered, from whatever cause. These improvements once fairly established, there will be an end of the doleful complaints hitherto reiterated, year after year, by the postmaster-general, of the inadequacy of the revenue to meet the outgoings; yet rarely, if ever, suggesting the wisdom of giving extended facilities to correspondence, were it only by way of experiment.

IV. HISTORY AND MECHANISM OF THE POST-OFFICE OF FRANCE.

Origin of French postal system.

The French postal system dates from the reign of Louis XI., who, by an edict of the 19th June 1464, established posting-houses on the great roads of the kingdom, at stages of four French leagues apart, and created a postmaster-general (*conseiller grand-maître des coureurs de France*), "to be near the king's person." This edict contains minute regulations as to the passports which every courier was to be provided with, and establishes a "register of passports," as a department of the newly-created post-office.[2] In France, as elsewhere, the posts were at first intended exclusively for the royal service, but they were soon rendered available (under stringent regulations) for private correspondence. The times of departure and arrival, however, continued long to depend on the exigencies of the governmental despatches.

For a century no important change appears to have beer made in the system. But in 1565 Charles IX. gave to the postmaster-general large powers with reference to the appointment and dismissal of postmasters and their assistants; and by subsequent letters-patent precluded the jurisdiction of the law courts in relation thereto, "because the establishment of the said office of postmaster-general (*controlleur-général des postes*) is a matter which concerns our special service, and is a dependency of our household, and therefore beyond the knowledge and province of our local officers and magistrates.[1] It is obvious, from the repeated issue of similar letters-patent at subsequent periods, that there were frequent contests on this point between the postmaster-general and the Parliaments.

---

[1] Miles, *Postal Reform, its Urgent Necessity and Practicability*, 19; Comp. *Banker's Magazine*, Dec. 1857, N.S., vii. 441. Both publications treat the questions connected with the American post-office system with great fulness and vigour. Whatever delays may yet be interposed, Mr Miles' labour and energy can scarcely fail of ultimate success.

[2] Le Quien de La Neufville, *Usages des Postes*, 1730, pp. 59–67.

The French post-office under Henry IV.

In 1603 Henry IV. issued letters-patent which recite the great importance and dignity of the office of *controlleur-général des postes*, "the designation of which," it is added, "we think fit to alter, seeing that the title of 'comptroller' has, since the creation of the said office, been made more common than it was at that time." For the future the official title was to be "general of the posts." At this period the office was held by De La Varanne, under whose successor (by purchase, at the price of 350,000 livres), Pierre D'Alméras, the first great improvements in postal arrangements were gradually introduced. In 1622 he laid down rules for the departure of the couriers at certain days and hours. In 1627 he established a tariff for letters. Until that date it had been the practice for the writers of letters to mark on the cover the fee which was to be paid by their correspondents on delivery, a practice which was found to involve a descending scale of payments. He also established, at the same date, a rudimentary sort of "money-order office," with the view, as it is stated in the regulation, of preventing abuses which had grown up by the frequent "enclosure of gold, silver, and precious stones in letters and packets, for the safe carriage of which the senders claimed to make the office responsible."[3] A system of registration of letters sent on the public service was also set on foot.

The farming of the post-office revenue in 1672.

It was not until the year 1672 that any settled revenue accrued to the State from the post-office. The sale of offices had brought occasional sums into the treasury from time to time, especially when the function of "general of the posts" was suppressed, in order to create three "superintendents." With a like view, decrees were repeatedly issued to restrain all persons other than the officers of the post from intermeddling with the supply of post horses in any part of the kingdom, as well as with the transport of letters. But the troubles of the Fronde had completely disorganized the service, which, as respects some parts of the country, may almost be said to have ceased to exist. In 1672 the postal revenue was let on lease to Lazare Patin, the first "farmer-general of the posts of the kingdom."[4] The farming system remained in operation until 1790. Local postmasterships continued for a long period to be hereditary. Great improvements of detail in many branches of the service were introduced by Louvois, who was "superintendent-general" from 1663 to 1691. From this period that office was usually held by one of the principal secretaries of State. In 1728 Cardinal de Fleury issued a regulation which made certain postmasters on one of the great lines of road that had become notoriously unsafe, specifically responsible for all losses or depredations occurring to the mails thereon, a principle which in subsequent years he extended to other main routes as occasion required. The rents of the farmers-general were increased from time to time, as the profits of the office augmented; but here, as in so many other departments of the State, some formidable abuses continued with little check.

Organization of the post-office under Napoleon.

The Revolution introduced a new system,—that of administration by a board. The last lease of the farmers-general was cancelled by a decree of the 12th June 1790. The constitution of the governing council, and its subordinate machinery, were modified by several successive laws; but the new plan, whatever its favourable results in other particulars, appears to have failed to secure a sufficient amount of direct and certain responsibility. Towards the close of the Consulate a postmaster-general (*directeur-général des postes*) was again appointed. He became president, *ex officio*, of the council, which continued to exist as a consultative body. In substance the organization thus established still continues. The council consists of the director and two sub-directors.

Extent of the postal monopoly.

The law of France vests in the post-office the exclusive right of conveying letters, newspapers, periodical works, packets, and papers of all kinds, not exceeding the weight of a kilogramme (two pounds), subject to the following exceptions:—1. Letters or packets sent by one private person to another, in charge of a domestic servant or express messenger; 2. Registers, maps, and plans; 3. Proceedings in law-suits; 4. Printed books, not periodical, nor bearing any writing, nor partaking of the character of a circular or advertisement; 5. Newspapers or periodical works in collective packets exceeding 2 lb. in weight; 6. Letters accompanying merchandise to which exclusively they relate, or simply authorizing the delivery of merchandise to the bearer; 7. Papers exclusively relating to the personal business of a carrier. These, and also the letters referred to under No. 6, must be open at the ends or sides. Every infraction of the privilege thus conferred is punishable by fines, which range, according to the character of the offence, from L.6 sterling up to L.120.[5]

In addition to the service of which it has a legal monopoly, the French post-office undertakes the conveyance at special rates of—(1.) Valuable articles of small dimensions (*valeurs cotées*); 2. Books, prints, and autographs; 3. Mercantile prices-current and circulars, &c.; (4.) Visiting-cards; (5.) Money subscriptions to the legal periodicals,—*Bulletin des Lois, Moniteur des Communes, Bulletin des Arrêts de la Cour de Cassation*; (6.) Money by orders as in England, at the rate of two per cent. commission."[6]

Rates of postage in France prior to 1847.

Until 1847 the general letter-rates were regulated by weight and distance, under a law of the 15th March 1827. The rates were, on the average, about two-thirds of the English rates for like distances prior to the adoption of the plan of Mr Rowland Hill. One postage was charged for any weight not exceeding 7½ grammes, or about ¼ oz. English, and an additional half-postage for every additional five grammes, or about ⅙ oz. English; so that a letter weighing an ounce was charged three postages and a half. Newspapers were charged two centimes (somewhat less than a farthing) if addressed to a place within the department in which the paper was published, and double that rate if addressed to another department. Other printed papers and pamphlets were charged at the rate of a halfpenny per sheet of 400 square inches. Under these rates, the number of chargeable letters, as nearly as could be ascertained, was in the year 1837, 83,348,008; that of newspapers and other printed publications was 50,376,029; that of franks was estimated at 8,760,000.[7] The gross receipts (exclusive of returns) amounted to L.1,615,294, the expenditure to L.882,653, the nett revenue to L.732,641.

Number of letters, amount of revenue, under the charge by weight and distance.

The details of the expenditure, which included the whole cost of providing and working the mail-coaches, were as follows:—

Salaries and wages	L.336,610
Conveyance of mails	487,142
Rent, furniture, printing, and incidental expenses	58,901
Total	L.882,653

French Post-Office.

French postal reform of 1848.

In August 1848 a decree of the National Assembly altered the scale and method of charge, by enacting that all mail letters of like weight should pay a uniform rate, irrespectively of distance. Such letters, if not exceeding a quarter of an ounce weight, were to be charged twenty centimes (or twopence sterling), and greater weights in prescribed proportion. This rate was increased in 1850 to twenty-five centimes (2½d.), but reduced to the former amount in 1854, so far as respects prepaid letters; unpaid letters being charged at one rate and a half, or threepence. These differential rates continue in force. Local letters pay in Paris, for any weight not exceeding 15 grammes (about ½ oz.), ten centimes, if prepaid; fifteen, if unpaid,—ten centimes being added for every additional 30 grammes, or fraction thereof. Local letters in the provinces pay the same rate, whether prepaid or not; the single rate carrying in the towns 15 grammes, but in the rural districts only 7½ grammes.

The legislation of August 1848, whilst lowering the letter rates for certain classes of correspondence, had the effect of cancelling the special tariff for mercantile circulars, prices-current, &c., which was previously in extensive operation. Matter of this sort passed almost entirely away from the post-office in consequence; but was brought back by a new law of June 1856, which established five distinct tariffs for postal matter, not of the nature of ordinary correspondence, as follows:—(1.) Newspapers and periodical works treating of politics or social economy, which are charged, for transit within the department in which they are published, at rates varying from 2 centimes (¼d.) for any weight not exceeding 40 grammes (about 1⅓ oz.), up to a franc and a half (1s. 3d.) for weights ranging between 2 and 3 kilogrammes (4 to 6 lb.), and double those rates beyond the limits of such departments. (2.) Newspapers (not political), magazines, transactions of societies, and other periodical works, exclusively devoted to literary, scientific, artistic, or industrial subjects, and appearing at intervals not exceeding three months; these are carried at rates nearly identical in amount with the preceding, but beginning at 1 centime within the department, and 2 centimes beyond it, for weights not exceeding 20 grammes, and being more minutely graduated on the scale. (3.) Circulars, catalogues, prices-current, &c., which are charged at a uniform rate, from a centime for 5 grammes or under, up to 3 francs for packets exceeding 2 and not exceeding 3 kilogrammes. (4.) Papers of business, commerce, and law proceedings in packets; these are charged at 50 centimes for any weight not exceeding 500 grammes (or 1 lb.), with an additional centime for every additional 10 grammes. (5.) Announcements of births, marriages, and deaths; visiting-cards, circulars, and other like matter, in the form of letters unsealed, or in wrappers open at the ends or sides;—these are carried, separately, at the rate of 5 centimes for 10 grammes within the district in which the post-office receiving them is situated, and at double that rate beyond such district (*arrondissement*). Registration, whether of letters or of packets, entails an extra payment of 20 centimes (2d.); and in the event of the loss of a registered letter or book-packet, the post-office is bound to pay to the sender 50 francs, whatever may have been its contents.

No portion of the postal reform of 1848 has worked more successfully than has the introduction of postage stamps. The good precedent set by the British post-office was of course the immediate cause; but it is curious to note that the practice had been, in rudimentary form, established in Paris itself almost two centuries before the advent of Mr Rowland Hill. In 1653 a master in chancery (*maître des requêtes*), named De Velayer, established an office close to the law courts, in pursuance of a royal grant giving him an exclusive privilege so to do, at which were sold for a penny stamped slips of paper, printed with the words, "Port payé le . . . jour du mois de . . . l'an 1653." These slips were folded round the letter or note to be thrown into the letter-box, the blanks in the superscription being first filled up. The boxes were cleared and the letters delivered three times daily.[1] How long the practice subsisted does not appear to be known. The success which has attended its re-introduction in 1849 (the law of August 1848 took effect on the 1st of the following January) will be strikingly indicated by the following tables, compiled from official sources:—

Postal statistics of France from 1847 to 1857.

Post-Office of France, 1847–57.—*Number of Stamps Sold, and of Prepaid and Unpaid Letters*

Years.	No. of Stamps Sold.	Total No. of Prepaid Letters (by Stamps or otherwise).	No. of Unpaid Letters.	Total No. of Letters Prepaid and Unpaid.	Gross Revenue.	Expenditure.	Nett Revenue.
					L.	L.	L.
1847.........	......	12,648,000	113,832,000	126,480,000	2,220,653	1,478,222	742,431
1848.........	......	12,214,040	109,926,360	122,140,400	2,205,839	1,522,496	683,343
1849.........	21,232,665	23,740,200	134,527,800	158,268,000	1,751,452	1,482,921	268,531
1850.........	21,523,175	31,900,000	127,600,000	159,500,000	1,814,999	1,416,316	398,683
1851.........	25,848,113	33,000,000	132,000,000	165,000,000	1,846,143	1,443,017	403,125
1852.........	28,589,540	39,820,000	141,180,000	181,000,000	1,942,063	1,379,984	562,078
1853.........	31,254,226	40,819,240	144,722,760	185,542,000	2,057,043	1,366,768	690,274
1854.........	83,359,350	104,068,650	108,316,350	212,385,000	2,237,826	1,410,354	827,471
1855.........	148,433,000	198,489,450	35,027,550	233,517,000	2,251,698	1,501,802	749,895
1856.........	169,508,750	221,773,024	30,241,849	252,014,873	2,326,801	1,512,120	814,680
1857.........	185,947,200	227,629,710	25,292,232	252,921,942	2,334,618	1,517,502	817,115

Thus, it will be seen, the number of *prepaid* letters, relatively to the whole number of letters transmitted, was in 1847 and 1848 but ten per cent. After the adoption of uniform rates for like weights in 1849, the pre-payment increased, but only very gradually, until 1854, when the introduction of the extra charge for unpaid letters, during the last half of that year, raised the proportion of prepaid letters from 22 per cent. to 49 per cent., which was further increased in 1855 (the first whole year of the differential postage) to 85 per cent. In 1857 the proportions of paid and unpaid letters became directly the reverse of those which had obtained ten years previously, the paid being now 90 per cent. of the whole number.

The next table shows the specific items of which the gross revenue of the French post-office during the same period was composed:—

---

[1] Quoted, on the authority of Pélisson, by Pierre Clément, in his *Appréciation des Consequences de la Réforme Postale*; and by the editor of the *Annuaire des Postes* (1858), p. 6.

French Post-Office.

French Post-Office.

Post-Office of France, 1847–57.—*Sources of the Income.*

Sources.	Gross Income in the several Years.										
	1847.	1848.	1849.	1850.	1851.	1852.	1853.	1854.	1855.	1856.	1857.

5. Places in the mail-coaches	85.124	64,995	61,365	46,712	36,961	26,202	21,014	17,435	11,189	5,969	614
6. „ mail-packets	44,364	49,776	58,710	52,155	43,150	3,154	2,265	2,329	324	...	...
7. Balances from foreign offices	45,986	34,738	35,857	39,361	44,969	51,831	51,529	53.595	85,636	83,675	83,338
8. Miscellaneous receipts	5,020	4,959	3,224	7,871	6,332	1,627	19,260	16,182	18,924	15,821	14,519
Total of receipts	2,220,653	2,205,839	1,751,452	1,814,999	1,846,143	1,942,063	2,057,043	2,237,826	2,251,698	2,326,801	2,334,618

Three of the sources of income here indicated have ceased to exist—the fourth and sixth absolutely, in consequence of the transfer of the packet service to ordinary commercial enterprise (aided, however, by an annual grant or subsidy); and the fifth by the almost entire suppression of the mail-coaches. Allowance being made for these changes, and for the contingent expenditure, the nett income, as compared with the outgoings, was, according to the official reports, 61 per cent. in 1847, and 79 per cent. in 1856.[1]

The total number of branch-offices, receiving-houses, and letter-boxes in Paris is 406.—namely, branch-offices (*bureaux d'arrondissement*) 10; supplementary offices, 25; receiving-houses and boxes (*boîtes aux lettres*), 371; that of country post-offices is 2374. The total number of *despatches*, daily, throughout France, is 3363; of which number 1054 are conveyed by mail-carts or coaches, 1031 on horseback, 1162 by letter-carriers on foot, 102 by railway, and 14 by steam-packets or ships. A hundred and two travelling post-offices are attached to the various railways, and employ 786 post-office functionaries. The packet service employed in January 1858, 53 steamers, having an aggregate of 11,000 horse-power, 43 of which were on the Italian, Algerian, and Eastern lines; 7 on the Corsican and Sardinian lines; and 3 on the Calais and Dover line. Ninety-three inspectors and 30 deputy-inspectors are employed in the general superintendence of the circulation service, which is further provided for by the appointment of 30 local comptrollers, each presiding over a district. Early in 1858 an enhanced scale of remuneration was introduced into the more important offices, with the view of increasing the efficiency of the service. The entire staff attached to the French post-office numbered (at the same date) 26,071 persons, and was thus composed:—

Post-Office of France.—Staff, January 1858.

	No. of Persons.
Administration generally	315
Collection and distribution of letters in Paris	1,194
Railway service (including travelling post-offices)	1,138
Country post-offices and agencies	21,585
Agents connected with packet service	57
Postmasters, chiefly employed in the relay service on the roads	1,782
Total	26,071[2]

Franked letters.

The system of official franking on public business still prevails in France. No regular account of the number or weight of franked letters is kept, but from time to time special inquiries on the subject have been instituted by the post-office authorities. This was the case in 1841, in 1850, and in 1854, and the results were as follows:—

Post-Office of France.—Franked Letters, 1841, 1850, *and* 1854.

Year.	No. of Franked Letters.	Amount of Postage, if charged at the ordinary rates.
		L.
1841	12,263,956	2,034,084
1850	38,810,442	1,692,095
1854	30,919,704	1,654,017

Statistics of undelivered letters.

Finally, it may be stated, that the number of letters undelivered in due course (*tombées en rebut*), from various causes, and that of letters containing money, bills of exchange, or other articles of value, *claimed* of the post-office as having miscarried during transit, for the years 1847 to 1857 inclusive, are thus stated in the official reports (we repeat the total number of letters posted in each year for the sake of comparison):—

Post-Office of France.—Undelivered and Miscarried Letters.[3]

Year.	Total Number of Letters Conveyed.	Number of Letters Undelivered in due course.	Number of Undelivered Letters eventually Corrected and Re-issued.	Number of Letters Claimed as Lost in Transit.	Number of Letters so Claimed Discovered and Restored.	Number Undiscovered.	Proportion of Letters Claimed, but Undiscovered, in each 100,000 carried by Post.
1847	126,480,000	3,706,000	...	4602	2982	1620	1·29
1848	122,140,400	3,987,000	...	4483	2837	1646	1·34
1849	158,268,000	4,351,000	...	4573	2151	2422	1·53
1850	159,500,000	4,363,000	...	4627	2857	1770	1·10
1851	165,000,000	4,059,000	307,512	4747	2458	2289	1·38
1852	181,000,000	3,836,000	301,534	4659	2249	2410	1·33
1853	185,542,000	3,106,785	315,209	5049	2763	2286	1·23
1854	212,385,000	3,261,930	294,631	5531	2866	2665	1·25
1855	233,517,000	3,349,498	400,000	6188	3236	2952	1·26
1856	252,014,873	2,867,904	389,254	6767	3111	3656	1·45
1857	252,921,942	2,734,493	629,309	[5395][4]	[2498]	[2897]	[1·40]

---

[1] *Annuaire des Postes*, 1858, p. 13:—"Ces déductions étant opérées, nous trouvons que le produit net versé dans les caisses du Trésor, a eté, comparativement aux dépenses; en 1847, de 61 %; en 1856, de 79 %."

[2] Ibid. 28.

[3] *Annuaire des Postes*, 1858, pp. 17, 32.

[4] The figures within brackets apply to nine months of the year only.

Comparative Statistics.

It appears from this table that the number of delayed and undelivered letters, together, has been reduced from 2·93 per cent., which was the proportion in 1847, and 2·46 per cent., which was still the proportion in 1851, to 1·8 per cent., the proportion in 1857; and, further, that whilst in 1851 only 7·57 of these were replaced in distribution, after inquiry, and ultimately delivered, 23 per cent. were so replaced and delivered in 1857. The figures, however, contrast unfavourably with those of the British post-office. There, in 1856, out of an aggregate number of postal letters amounting to 478,000,000, the total number of letters undelivered in due course was but 2,400,000, of which 1,581,000 had to be returned to the writers after failure of all the attempts which could be made to deliver them. In 1857 the number of *returned* letters was about 1,700,000, out of an aggregate of 504,000,000. The French official tables, moreover, do not discriminate between the letters returned and those destroyed. Nor do they give any statistics of undelivered newspapers (which, in Great Britain, in 1857, were about 1 in 22 of the whole number).

Equally vain would be any attempt to discover the rules, methods, or results of the inspection of "suspicious" correspondence. The historian of French police under the monarchy writes of this practice, as it then existed, with significant brevity:—"Violation of the secrecy of letters is regarded as an ordinary prerogative of government, and that pretended prerogative weighs as heavily on the princes nearest to the throne as on the most obscure subject of the realm."[1] There is good reason to believe that these words have still as much applicability and force as they ever had; but the whole matter remains one of inferential deduction. Precise evidence is at present out of reach.

Comparative Statistics.

V. COMPARATIVE STATISTICS OF THE PRINCIPAL POST-OFFICES OF THE WORLD.

One of the chief difficulties which lie at the threshold of comparative postal statistics on a comprehensive scale arises from the fact, that nearly all the continental post-offices are concerned with the transport of passengers as well as of letters. This difficulty, however, does not affect *all* the points of comparison, even as between the continental systems and those of Britain and America, nor does it in any degree diminish the value of the comparison between the working expenses and revenue of the same office at different periods. We give, therefore, the best approximation to such a synopsis which is at present attainable, taking as a foundation the results of the elaborate inquiries of Mr Pliny Miles, contributed to the New York *Bankers' Magazine* in November 1857, but with needful variations:—

Comparative Statistics of various Postal Systems.

Country.	Ordinary Amount of Postage for Single Letters.	No. of Letter Rates.	Year.	Gross Revenue.	Expenses.	Year.	Gross Revenue.	Expenses.
	Pence.			L.	L.		L.	L.
Austria	1¼ to 3¾	3	1841	702,680	417,269	1852	906,805	839,860

Hanover	1½	1	1849	35,762	12,470	1852	31,592	12,040
Holland	1 to 3	3	1849	112,547	39,927	1852	115,217	62,261
Oldenburg	1¼ to 1½	2	1851	12,526	10,910	1852	12,361	12,120
Peru	3*d.* to 2*s.*	6	...	...	...	1852	7,600(?)	7,600(?)
Portugal	1¼	1	...	...	...	1853	36,900	27,675
Prussia	1¼ to 3¾	3	1843	1,123,026	895,844	1853	1,285,596	1,133,101
Russia	4	1	1842	665,549	261,988	1852	771,080	489,978
Sardinia	2	1	1850	125,116	67,038	1852	128,506	78,787
Saxony	½ to 2¼	3	1849	117,756	79,637	1852	133,579	90,654
Spain	2½	1	1844	254,200	152,600	1852	326,370	208,250
Sweden	1 to 5	9	1839	52,000	45,300	1852	66,888	64,788
Switzerland	½ to 1½	3	1850	207,146	177,226	1852	260,585	192,484
Tuscany	1¼	1	1839	30,595	15,919	1852	45,109	28,483
United States	½ to 5	3	1840	908,704	943,647	1856	1,524,164	2,081,573
Wurtemburg	½ to 2	3	...	...	...	1850	76,972	74,287

Broadly it may be stated, that the half-ounce scale of Great Britain is now adopted in nearly the whole of Germany, in the United States, in Holland, Denmark, Spain, the Brazils, and Peru. In most other points of postal economy there are still wide diversities of practice; but the introduction of a simple scale of charge is in itself a vast improvement, and the sure pioneer of other improvements to come. How great the alteration is, in some cases, will appear by the statement, that in Spain, for example, under the old system, inland letters were charged at the rate of one real (2½d.) for *six* sixteenths of an ounce, and the fifth of a real for each eighth of an ounce additional; whilst all letters to the Spanish islands were treated as single up to *five* sixteenths of an ounce, and were charged at the rate of 1s. 5d., with an additional penny for every additional *sixteenth* of an ounce. The anomalies of the postal arrangements of many European and American countries are still numerous and complex enough. France yet retains the quarter-ounce scale, as do also Switzerland, Sardinia, and Tuscany. The unitary letter weight of Belgium, Brunswick, and Portugal is three-eighths of an ounce; that of Sweden is about five-eighths; that of Bremen, Russia, and Chili, is an ounce; and of Russia it may be noted, in passing, as a fact of some significance, that the whole number of letters posted in a year (1855),[2] throughout the empire, is considerably less than the number posted in the single town of Liverpool and its suburbs. Naples, again, adheres to the old plan of charging by the sheet, and is very chary of publishing the statistics of her post-office. And, lastly, in Iceland, letters are carried free of postage at the cost of the national treasury. The worthy Icelanders, however, have an intense love of orderly arrangements. Their mail to Denmark sails once in six weeks. In order that the way-bill of the postal letters may be carefully made out and alphabetically arranged, they find it necessary to close the boxes two days before the departure of the mail.[1]

---

[1] Frégier, *Histoire de l'Administration de la Police*, ii. 363.

[2] About 16,400,000, according to an article in the *Journal de St Petersboury* of 1857.

Comparison of postal correspondence with population in certain countries.

The number of letters to each 1000 persons of the whole population, as it stood in 1853, was in Great Britain, 14,760; in Switzerland, 8239; in the United States, 4404; in Holland, 4367; in France, 4192; in Belgium, 2603; in Spain, 2209. In Great Britain, prior to the postal reform of 1840, the number of letters to each 1000 persons was but 3055, or little more than one-fifth of the ratio of 1853. In Holland the like proportion, prior to its postal reform of 1850, was about 2001 letters to each 1000 persons. There the inland letters have increased under the new tariff from 4,274,180, the number of the year 1849, to 12,729,143, that of the year 1856; and the number of foreign letters from 1,804,180 to 3,395,973.[2] In 1850, it may be added, the mails of Holland were conveyed over an aggregate distance of 6247 Dutch miles; in 1856, over an aggregate of 17,076 miles.[3]

The details of the comparison of 1853 run thus:—

Postal Correspondence, as compared with Population, in Six European States, and in the United States of America, 1853.

Country.	Population in 1853, or at nearest Census.	Number of Letters conveyed by Post in 1853.	No. of Letters to each 1000 persons in 1853.	Estimated cost of 1000 Letters.

VI. OCEAN MAIL SYSTEMS OF VARIOUS COUNTRIES.

The importance of an efficient system of ocean mails cannot be measured by the profit or loss which may directly attend it. With a regular and rapid packet service, the commercial prosperity and the defensive power of a country are obviously and closely connected. On this point public opinion has made great strides since 1830, when we find the Commissioners of Revenue Inquiry asserting, as a matter about which there could be no sort of doubt, that the excess of the outgoings of the packet service over its income, "amounting in the period of nine years to about L.300,000, must be considered a total loss." Almost a quarter of a century afterwards, the same subject was elaborately reviewed by a Treasury committee (appointed in 1853.) "It is unreasonable," reports this committee, "to expect that any person, or association of persons, should incur the expense and risk of building vessels, forming costly establishments, and opening a new line of communication at a heavy outlay of capital, without some security that they will be allowed to continue the service long enough to reap some benefit from their undertaking. It must be borne in mind that the expensive vessels built for the conveyance of the mails at a high rate of speed, are not in demand for the purposes of ordinary traffic, and cannot therefore be withdrawn and applied to another service at short notice. . . . . The value of the services thus rendered to the State cannot, we think, be measured by a mere reference to the amount of the postal revenue, or even by the commercial advantages accruing from it. It is undoubtedly startling at first sight to perceive that the immediate pecuniary result of the packet system is a loss to the revenue of about L.325,000 a year; but although this circumstance shows the necessity for a careful revision of the service, and though we believe that much may be done to make that service self-supporting, we do not consider that the money thus expended is to be regarded, even from a fiscal point of view, as a national loss."[5]

Introduction of steamers into the postal service of Great Britain.

The conveyance of mails in steamers was first adopted by the British post-office in 1821. The Holyhead station, for Ireland, and the Dover station, for the Continent, were selected for the first experiments. Theretofore the practice had been to engage sailing-vessels, under agreements with their owners or commanders, at fixed annual payments, for the carriage of the mails; the proceeds of passengers and freight accruing, of course, to the owners. After various fruitless negotiations with steam-packet companies, it was determined to build vessels at the cost of government. Eventually six such packets were stationed at Holyhead, and several others at Dover and elsewhere. The report of the Commissioners of Revenue Inquiry led to the gradual and advantageous introduction of commercial contracts for this service, the first of which was made by the postmaster-general in 1833 with the Mona Isle Steam Company, to run steamers twice a week between Liverpool and Douglas. This company has retained the contract during twenty-five years at the same rate. In the following year the General Steam Navigation Company contracted to carry the mails twice a week between London and Rotterdam, and London and Hamburg, for L.17,000 a year. This contract remained in force until 1853, when these mails were transferred to the Ostend route. In 1837 a contract was made with Mr Richard Bourne to convey the mail weekly from Falmouth to Vigo, Oporto, Lisbon, and Gibraltar, for L.29,600 per annum. This contract was transferred in 1843 to the Peninsular and Oriental Company, the port of Southampton was substituted for Falmouth, and the trips limited to three, monthly, the subsidy being proportionally reduced. In 1839 an epoch was marked in world-history, as well as in postal affairs, by the establishment of a fortnightly mail line between Liverpool, Halifax, and Boston, by contract between the postmaster-general and Samuel Cunard of Halifax, at L.60,000 a year. Soon the port of destination was made alternately Boston and New York; and, with this change, the contract continues in greatly increased activity, weekly trips being required instead of fortnightly, and the subsidy being raised by the renewal contract of 1850 to L.173,340 a year, with certain contingent allowances in addition. Last year (1858) the Cunard Company owned nine steamers, with an aggregate tonnage of 18,406, and an aggregate horse-power of 6418. This continues in force until 1862, with twelve months' notice of its discontinuance. In 1840 a contract was made for mail steamers to Malta, Corfu, and Alexandria, extended in 1845 to Suez, Bombay, Ceylon, Calcutta, Hong Kong, and Shanghai. This contract was renewed in 1853, and made terminable in 1862, on twelve months' notice. By its terms, the Peninsular and Oriental Company was bound

Ocean Mail Systems.

to provide two packets for the conveyance of the Indian mails, one to steam between Southampton and Malta, and another between Marseilles and Malta; then one between Malta and Alexandria, and one between Suez and Aden; one between Aden and Bombay, and another between Aden and Calcutta. But owing to the rapid increase of Indian traffic, the company, of its own accord, doubled the service between Malta and Alexandria, and also between Suez and Aden. The terms of the contract with the post-office secured its performance for a subsidy of L.244,800 a year; but the communication having now become double during the greater part of the route, an addition to the amount was wisely made in 1857, which insured an additional packet between Marseilles and Malta, and thus made the most important mail route to India double throughout. The departure of the packets was also arranged at intervals of about a week. At this date the company had already thirty-nine vessels, with a tonnage of 48,835, and a horse-power of 12,850. In 1856 a new contract was made for a monthly service between Southampton, Marseilles, Malta, Alexandria, Suez, and Sydney, with the European and Australian Mail Steam-Packet Company, at L.185,000 a year. Under this contract the company runs 336,000 miles a year, at 11s. a mile.

Ocean Ma Systems

For the service of the West Indies, and of Central America, Mexico, and Brazil, a contract subsists with the West India Royal Mail-Packet Company, which dates from 1850, and is terminable in 1862 (on the usual notice). Under this contract the company runs steamers twice a month over 37,000 miles. Its aggregate annual mileage is 547,296, and the average pay 9s. 10d. per mile. These are the chief contracts at present in force. The entire ocean mail service stood thus in 1857:—

Ocean Mail Service of Great Britain—Close of 1857.

Routes.	Date of Service.	No. of Steamers.	Horse-Power.	Tonnage.	No. of Crews.	Voyages.	Annual Subsidies.

Totals	...	118	42,256	140,140	8,137	......	1,066,797

At the date of the report of the Treasury committee, already referred to (1853), the amount of these subsidies was L.822,390, and the estimated amount of postage was but L.479,600.[2] Under the increased payments of 1857, the service has been improved, and the revenue has also benefited by some of those improvements, but the actual receipts cannot be estimated at more than one-half of the outgoings. The deficit becomes a charge upon the naval estimates. The remarks of the committee on this point retain all their force:—"The objects which appear to have led to the formation of these contracts, and to the large expenditure involved, were—to afford a rapid, frequent, and punctual communication with those distant ports which feed the main arteries of British commerce, and with the most important of our foreign possessions; to foster maritime enterprise; and to encourage the production of a superior class of vessels which would promote the convenience and wealth of the country in time of peace, and assist in defending its shores against hostile aggression. These expectations have not been disappointed. The ocean has been traversed with a precision and regularity hitherto deemed impossible; commerce and civilization have been extended; the colonies have been brought more closely into connection with the home government; and steam-ships have been constructed of a size and power that, without government aid, could hardly—at least for many years—have been produced."[3]

The ocean mail service of the United States of America.

The experience of Great Britain as to the value of its costly packet service has excited energetic endeavours in the United States to arouse the government to the necessity of keener emulation. Mr Thomas Rainey, the author of an able work entitled *Ocean Steam Navigation and the Ocean Post*,[4] has endeavoured to do for this branch of the postal service of his country what Mr Pliny Miles is so zealously striving to do for its inland mails and local posts. Mr Rainey contends that, whilst steam mails upon the ocean control the commerce of the world, the United States have not established such mails commensurately with the national ability and requirements; that only very fast and powerful steamers can carry the mails with adequate speed; that such a speed is so costly that the steamers cannot live on their own receipts; that self-support is not likely to be attained by increasing the size of steamers; that the propelling power in fast steamers must occupy all, or nearly all, the available space not devoted to passengers and express freight; that American trade has greatly suffered for the want of more ocean mails, rapid and well organized; and that the only way in which the government can discharge its unquestionable duty in this respect is, by imitating British example in the payment of liberal subsidies for the conveyance of mails for a long term of years.[1]

---

[1] This contract expired in 1857, and a new one was made with the Union Steam Shipping Company with improved results for the public service.

[4] Second edition, London, Trübner and Co., 1858.

The Havre and Bremen mail services were the first established in the United States. The former remains in the hands of the Old Havre Company, founded by the late eminent merchant, Mr Mortimer Livingston. The Bremen line passed into the hands of Mr Vanderbilt in 1857, on the termination of the contract. On both lines, for the present, the mails are carried for the gross ocean and inland postages. The Pacific Mail Steamship Company, and the Aspinwall Steamship Company, respectively, maintain the two lines which connect the Atlantic and Gulf seaboard with the American possessions in the Pacific, California, and Oregon. The Pacific Company possesses thirteen steamers, and may, it is said, boast that it "never lost a trip, a mail-bag, or a passenger, by marine disaster, during the eight or nine years they have been running in the Pacific. These steamers run the 3300 miles between Panamá and San Francisco within an average period of less than fourteen days, stoppages included, or at the rate of about 250 miles a day.[2] They carry the mail at a charge of 6s. 11d. per mile. The United States Mail Steamship Company has six steamers, with a tonnage of 8544. This company's vessels run 5200 miles twice a month, at 7s. 9d. per mile. The Collins Company had at the close of 1857 three steamers, with an aggregate of 9727 tons. At that date the American ocean mail service, in commission, stood thus:

Packet Service of the United States of America, Nov. 1857.[3]

Route.	No. of Steamers.	Tonnage.	Miles of Route.	No. of Trips	Compensation.
New York and Liverpool (*Collins Line*).	3	9,727	3100	40	L.77,000

French ocean mails.

Some particulars of the French packet system have been glanced at already. Here it must suffice to add that the stations (Mediterranean and Levantine), routes, and departures of the mail steamers, were as follows in 1858:[4]—

Route.	Trips.	Length of Route.
Marseilles to Malta.................	Weekly	870 miles
Marseilles to Naples.................	......	432 „
Marseilles to Alexandria..........	Fortnightly	1500 „
Alexandria to Smyrna.............	Do.	1230 „
Marseilles to Smyrna.............	Weekly	1359 „
The Piræus to Smyrna.............	Fortnightly	236 „
Smyrna to Constantinople.........	Weekly	300 „
Marseilles to Constantinople......	Do.	1441 „
The Piræus to Constantinople....	Fortnightly	667 „
Constantinople to Ibraila..........	Weekly.	404 „
Constantinople to Trebizond......	Do.	552 „

This service, together with that of part of the Algerine lines, is performed by the powerful company of the Messageries Impériales; but the official documents at present accessible do not state the terms of contract. The company possesses fifty steamers, with an aggregate power of about 12,500 horses, and an estimated tonnage of 60,000. It has recently added the line of the Brazils to its former contracts.

Here we close our protracted survey. It offers not a few topics for comment and further elucidation, which cannot, however, find present place. One reflection will probably have suggested itself to many readers during this retrospect of post-office annals: Few subjects should give more encouragement for steady perseverance to the practical reformer in the field of social science. What has been achieved, with great toil and difficulty, and after long delay, in one country, speedily works its way into other countries, and produces results of world-wide magnitude. Even when improvements are borrowed with an ostentatious avowal of jealousy at the progress they have facilitated amongst those who originated them, they cannot fail to add some strength to the ties which give to different countries an indefeasible interest in their common prosperity, whatever may be the prejudices or animosities of the passing moment. The history of postal improvements is eminently a history of international benefactions. (E. E.)

POSTULATE, in ordinary language, signifies any position assumed without proof, or one which is considered as self-evident. In *geometry* it is applied to whatever is to be assumed or taken for granted; as in Euclid's three postulates, which differ from his axioms in the manner in which they are put. The former is put forward as an assertion, the latter as a request. In *philosophy* it means any proposition of which the truth is demanded or assumed for the purposes of future reasoning.

POTASH. See CHEMISTRY.

POTATO (Nat. Ord. *Solaneæ*, see BOTANY), a valuable vegetable, said to be introduced into this country by Sir W. Raleigh about 1586. Queen Elizabeth in 1584 granted a patent "for discovering and planting new countries not possessed by Christians," when Raleigh equipped some ships and set sail for America. Thomas Herriott, who accompanied the expedition, sent home the description of a plant called *openawk* by the natives of Virginia. Gerard, in his *Herbal*, mentions that he had the plant from Virginia, that he had grown seedlings of it in 1590, and that it grew admirably in his garden. He gave it the name of *Solanum tuberosum*, afterwards adopted by Linnæus, and which it still retains. Sir Robert Southwood, president of the Royal Society, claimed the honour for his grandfather of having first cultivated this plant in Ireland, where it has so long constituted the principal food of the peasantry. Sir Robert stated that his ancestor obtained roots of the potato from Sir Walter Raleigh. The story of Sir Walter's gardener at Youghal, on going to taste the apples of the fine American fruit, being so sadly mortified at not finding them, and of his subsequent discovery of the tubers when his master desired him to throw out the weeds, is probably authentic.

The potato, it seems, had been known in Europe for some considerable time before. The name which we now apply to it seems to be taken from the Spanish or Portuguese, while they derived the epithet from the mountaineers of Quito in South America. The inhabitants of Quito called it *papas*, which the Spanish corrupted into *battata*, and the Portuguese softened into *batata;* hence the English *potato*. This plant was cultivated in Ireland long before its introduction into Lancashire, which was owing, it is said, to a shipwreck at the mouth of the Ribble. From Lancashire it soon spread, first into the gardens, and gradually into the fields of Great Britain. (For the cultivation and disease of the potato, see Agriculture.)

[4] Hon. H. King to T. Rainey, 12th Nov. 1857, *Ocean Steam Navigation*, 220.

POTEMKIN, Gregory Alexandrovich, a famous Russian statesman, was born of a noble though poor family at Smolensk in 1736. He was an ensign in the Horse Guards when an incident occurred which set him upon the road to eminence. Happening to be in St Petersburg on the day of the revolution of 1762, and seeing that Catherine II., as she rode through among the ranks, had no tassel upon her sword, he presented her with the missing badge from his own weapon. This act of gallantry caught the queen's attention; the manly beauty and noble bearing of the young soldier affected her susceptible heart; and the ardent manner in which he responded to her amorous advances completed the impression. In no long time he was installed as favourite, and occupied a suite of apartments in the palace. It is true that the fickle royal heart soon transferred its affections to another. But by that time his grotesque and extraordinary character had begun to command attention in the political world. Up from among his sluggishness, sensuality, extravagance, and whimsicality, there had sprung into action, as if spontaneously, a strong intellect, which easily rendered him the prince of tuft-hunters. The other votaries of civil power soon began to feel that they could not stand before him. Their hearts lay open to the gaze of his instinctive insight; their intrigues could not escape his ready observation; and their downfall was speedily effected by his dexterous policy. Ministers, generals, and favourites he raised like puppets before the public, used them for a while, and when he was tired threw them aside. Catherine herself, with all her decision and force of character, could not escape from his influence. With delicate tact he laid his hand upon the springs of her conduct, and controlled them to his own advantage. He gained her ear by flattery; he earned her gratitude by the invincible energy with which he fulfilled her behests; and he won her admiration by the striking projects which he formed for extending the bounds of the empire. His very faults were not without their effect. It was interesting to the queen to see the giant put off his intellectual armour, and lounge in undress for several successive weeks, playing at chess or cards from morning till night. Potemkin having thus attained to the virtual possession of the supreme power, began to use it with the most unbounded license. He drew upon the public treasury for money to gratify his extravagant epicurean taste. He insulted, bullied, and cuffed the nobility upon the slightest provocation. He even murmured, chafed, and resisted when his royal mistress attempted to cross his wishes. His condition, in fact, was more like the state of an Asiatic potentate than the position of a European subject. The Taurian palace, a superb edifice embodying the very highest ideas of luxury and magnificence, was erected for his residence. There he was wont to dream away his existence, surrounded by every circumstance of wealth, and pomp, and power. Diamonds were his playthings, which he threw aside as soon as he was tired. The revenues of vast estates were his pocket-money, which he recklessly squandered on the gratification of his meanest desire. Crowds of attendants stood by, ready to carry into execution his every passing whim. Aristocratic courtiers truckled before him, craving his interest for some high appointment. There was scarcely an honour in Europe which was not lavished upon him. Crowned potentates in different countries ennobled him with every kind of dignity and honour. His own sovereign often paid him a visit, adding new lustre to his gorgeous halls by the beauty and effulgence of her court. He was, in fine, the possessor of every gift that the world could bestow, when Fate, as if envious of such an unclouded prosperity, interposed to lure him on to his destruction. It was in 1787 that Prince Potemkin, bent upon achieving some military feat, and thus winning the ribbon of St George, undertook the command of an unfortunate war against the Turks. Success, it is true, attended him at first. His energy was as resistless in battle as it had been in politics; Oczakow was taken by a terrific storming in 1788; and in 1791 he returned to St Petersburg to be honoured, enriched, and fêted in a manner worthy of an emperor. But after his return to the scene of war, a deadly epidemic seized upon him at Jassy in 1792. In vain did the robust giant laugh at it, eat and drink more voraciously to show his contempt for it, and think to shake it off by setting out to Nicolaieff. The disease only fixed its fangs the deeper. On the road he became alarmingly sensible that it was mastering him. He alighted in terror, fell down upon the grass by the wayside, and immediately expired. (See *Biog. Univ.;* Tooke's *Reign of Catherine II.*, 3 vols., 1799; and *Mémoires de Catherine II., ecrits par elle-meme*, 1859.)

POTENTIAL, in grammar, an epithet applied to one of the moods of verbs. The potential is the same in form with the subjunctive, and is, according to some, implied in that mood; but others consider that it differs from the subjunctive by always implying in it either *possum*, *volo*, or *debeo*. It is also called the *permissive mood*, because it often implies a permission or concession to do a thing, and is denoted in English by the auxiliary verb *may* or *might*.

POTENZA, a fortified town of Naples, capital of the province of Basilicata, on the summit of a hill in a wild region of the Apennines, 85 miles E. by S. of Naples. It is for the most part meanly built, but contains several handsome buildings. The cathedral is a fine Doric edifice; and there are two other churches, an ecclesiastical college, and several monasteries. Potenza is the seat of the highest civil and criminal courts of the province. The ancient *Potentia* stood at a place called Murata, in the plain below the modern town. Some ruins of it have been discovered. Cloth, leather, and earthenware are manufactured in Potenza. Pop. 8900.

POTHIER, Robert Joseph, a celebrated French jurist, was born at Orleans in 1699, and received his education in his native town. At an early age he turned the whole bent of his mind towards the study of law. His ready and untiring intellect, his tenacious memory, and his upright, moral character, formed a good basis for a legal reputation. Accordingly, his *Pandectæ Justinianæ*, which began to be published in 1748, and which was afterwards finished in 3 vols. in 1752, introduced him to a distinguished career. He was appointed professor of law in the university of his native city in 1749, and became an earnest and popular teacher. Pothier died in 1772.

There also issued from his pen the following series of learned works:—*Traité des Obligations*, in 2 vols., 1761; *Traité du Contrat de Vente*, in 3 vols., 1762; *Traité du Contrat du Constitution de Rente*, 1763; *Traité du Contrat de Change et Billets de Commerce*, 1763; *Traité du Contrat de Louage*, 1764; *Traité du Contrat de Bail à rente*, 1764; *Traité des Cheptels*, 1765; *Traité des Contrats de Bienfaisance*, in 2 vols., 1766-67; *Traité des Contrats Aléatoires*, in 2 vols., 1766-67; *Traité du Contrat de Mariage*, in 2 vols., 1768; *Traité de la Communauté*, in 2 vols., 1769; *Traité du Douaire*, 1770; *Traité du Droit d'Habitation, des Donations, et du Don Mutuel*, 1771; and *Traités du Domaine de Propriété, de la Possession et de la Prescription*, in 2 vols., 1772. After his death all his publications, with the exception of the *Pandectæ Justinianæ*, were published in a collected form in 4 vols. 4to, 1781. His posthumous works had also been published in 8 vols. 12mo, Orleans, 1776–78. All his productions, with the exception of the *Pandectæ*, are included in the edition of Siffrein, 20 vols. 8vo, Paris, 1820–24. The latest edition is that of Bagnet, in 10 vols. 8vo, 1845–48.

POTOMAC, a river of the United States of North America, formed by the confluence of the north and south branches, both of which take their rise in the Alleghanies, and unite on the northern frontier of Virginia. Through the whole of its course it separates that state from Maryland and the district of Columbia, flowing E. and S.E. till it falls into Chesapeake Bay. Its length from the junction of the two branches is about 350 miles; and its breadth at its mouth 6 or 8 miles. Its largest affluent is the Shenandoah, which has a volume of water little inferior to the main river. It is navigable for ships of the line to Washington, the capital of the United States, 120 miles above its mouth; but above this its course is interrupted by numerous falls and rapids.

POTOSI, a town of Bolivia, capital of a department of the same name, stands in a bleak and barren country, on the northern slope of the Cerro de Potosi, S. Lat. 19. 36., W. Long. 65. 20. It is one of the highest inhabited places in the world, being about 13,500 feet above the sea. On account of the unevenness of the site, the town is irregularly built; the houses are substantial, but not more than one storey high in general. In the middle of the town is a large public square, with an obelisk in honour of Bolivar. Here also stand the large granite cathedral, and the long, low range of government buildings. The town has also numerous churches, a large mint, and a college. The temperature is very hot in the sunshine, but in the shade the cold is extreme. The place is, however, healthy, notwithstanding the difficulty of respiration at such an elevation. The silver mines of Potosi, for which the place is chiefly famous, are described under BOLIVIA. Those parts of the town that were inhabited by Indians are now almost all in ruins, and the population has dwindled down from 100,000, which it is said to have contained in the seventeenth century, to 15,000.

The department of Potosi, which is bounded on the N. by that of Oruro, N.E. and E. by the department of Chuquicaca and province of Tarija, S. by La Plata, and W. by the province of Cobija and by Peru, has an area of 37,227 square miles. It is a mountainous table-land, and many of the heights rise above the limits of vegetation. Its chief production is the silver obtained from the mines of Potosi. Pop. 297,000.

POTSCHINKI, a town of European Russia, in the government, and 120 miles S.S.E. of Nijni Novgorod, on the Rudnia. It has manufactures of linen, some trade in cattle, and a large stud. Pop. 5000.

POTSDAM, a town, and the second royal residence of Prussia, in the province of Brandenburg, stands on the Havel, which here forms a small lake, 17 miles S.W. of Berlin. It occupies one of the most beautiful situations in the province. The banks of the Havel are beautifully wooded, while here and there in the vicinity are seen hills covered with vines. The river is crossed by several bridges, the finest of which is that of Teltow, consisting of eight iron arches reposing on massive stone piers. Potsdam is, next to Berlin, the finest town in Prussia. It has broad, well-paved streets, handsome houses, and fine squares; but presents in general a lifeless and deserted aspect. It consists of the old and the new town,—the former on an island formed by the Havel on one side and by a canal on the other; and there are also several suburbs. The market-place, a large and handsome square, contains an obelisk adorned with busts of Frederick William, the great elector, and of the first three kings of Prussia. In the neighbourhood stands the royal palace, a fine old building begun in 1673, and completed in the reign of Frederick the Great. It contains in the interior the rooms occupied by Frederick, preserved in the same state as he left them. Here are also the apartments of Frederick William III. and of the present king. In front of the palace there are extensive pleasure gardens, containing an artificial pond, several pieces of sculpture, and statues. The church of St Nicholas is a Grecian building, containing in the interior, which is very fine, several beautiful paintings and frescoes. The council-house, built in 1754 after the model of that of Amsterdam, has a cupola surmounted by a colossal figure of Atlas bearing the globe. The garrison church, near the west end of the town, contains the tombs of Frederick William I., the founder, and of Frederick the Great. Outside of the town lies Sans Souci, the favourite residence of Frederick the Great. The grounds are laid out in a formal style, and adorned with fountains and numerous statues. On a height, ascended by six terraces, stands the palace, a long building of one storey, built by Frederick 1745–47. It is chiefly remarkable for its historical interest; the bedroom of the great king and the apartment of Voltaire are still to be seen, as well as a clock which Frederick used to wind up himself, and which stopped at the moment of his death. The new palace, which is also within the grounds of Sans Souci, was built by Frederick after the Seven Years' War, to show that his resources were not exhausted. Near these grounds is Charlottenhof, a beautiful villa in the Italian style. Another royal residence in the vicinity of Potsdam is the Marble Palace, a building at once splendid and tasteful, both in the interior and the exterior. The Peacocks Island (*Pfaueninsel*), in the Havel, is occupied by a beautiful park containing many fine large oak trees and a royal villa. The town of Potsdam has, besides the buildings already mentioned, several schools and benevolent institutions. Among the former are a gymnasium, a normal seminary, military, industrial, and other schools. Of the latter, the most important are the infirmary, the military orphan hospital, poor's-house, and an asylum for the widows of clergymen and schoolmasters of the Established Church. There are also extensive barracks, a guard-house, theatre, &c. The manufactures of Potsdam are numerous and important. The chief is that of arms, of which about 800 are produced weekly. Chocolate, sugar, silk, cotton, linen, leather, hosiery, hats, porcelain, musical instruments, and carriages are also made here. The trade is of very little importance. Potsdam stands on the railway between Berlin and Magdeburg. The celebrated Alexander von Humboldt was born here in 1767. Pop. (1849) 39,864.

POTT, PERCIVAL, one of the most eminent surgeons of his day, was born in London in 1713, and received his education at Darne in Kent. His friends wished him to enter the church; but a decided bias led him to devote himself to surgery. Apprenticed in 1729, to Mr Nourse of St Bartholomew's Hospital, he learned the first principles of his profession. Appointed in 1749 as one of the principal surgeons of the same institution, he had abundant scope for testing and correcting these principles. His knowledge became so great that, in 1756, on being laid aside from practice in consequence of a severe compound fracture of the leg, he appeared in print as a great surgical reformer. As his various works came out, they promulgated many new and valuable opinions, the results of extensive experience, unwearied zeal, and skilful observation. His *Treatise on Ruptures*, 8vo, London, 1756, soon became a standard work. His dissertation *On Injuries in the Head*, 8vo, 1760, was unrivalled for its originality and methodical perspicuity. His paper *On Amputation*, 8vo, 1778, clearly determined and specified those cases in which that method of cure was proper and necessary. In fact, he greatly simplified the art of surgery by limiting the employment of severe and extreme operations, and by trusting more to the healing virtue of nature. Before his death in 1788 he saw the old savage plan of surgical treatment discontinued, and his own new and humane method introduced. The latest edition of the works of Percival Pott is that by Sir James Earle, in 3 vols 8vo., 1808. One of Pott's pupils was the celebrated John Hunter.

POTTER, John, Archbishop of Canterbury, was the son of a linen-draper at Wakefield in Yorkshire, and was born about 1674. Having attained to great proficiency in Greek while at school, he entered University College, Oxford, at the age of fourteen. He was induced to publish, at the suggestion of the master of his college, *Variantes Lectiones et Notæ ad Plutarchi librum de Audiendis Poetis cum Interpretatione Latina Hugonis Grotii; item Variantes Lectiones et Notæ ad Basilii Magni Orationem ad Juvenes quomodo cum fructu legere possint Græcorum libros*, 1693, 8vo, when only in his nineteenth year. He shortly after became master of arts, was chosen a fellow of Lincoln College, and took orders. In 1697 he edited the *Alexandra* of Lycophron; and his *Archæologiæ Græcæ* appearing soon after, at once established his fame as a scholar. He became bachelor of divinity in July 8, 1704, and was appointed chaplain to Archbishop Tenison, when he required to exchange Oxford for Lambeth. He became doctor of divinity in 1706, and soon after was made chaplain in ordinary to her Majesty Queen Anne. He published during the following year *A Discourse of Church Government.* In 1708 he was chosen regius professor of divinity, and canon of Christ Church, Oxford; and in 1715 he was made bishop of Oxford. An edition of Clemens Alexandrinus occupied his attention during the same year; and shortly afterwards he deemed it necessary to publish against the doctrines of sincerity as advocated by Hoadly, Bishop of Bangor. In January 1736–7 he was raised to be Archbishop of Canterbury. This arduous and important office he filled during ten years with considerable reputation, until in 1747 he was cut off by a lingering disease. He was a learned and exemplary churchman, but somewhat too strongly tinctured with the pride of office. His theological works were printed at Oxford in 3 vols. 8vo, 1753.

POTTER, *Paul*, a distinguished animal-painter, was born at Enkhuysen in 1625. His father, who bore the same name, was an artist of moderate ability, and from him he received his instruction. At the age of fifteen he was considered quite a prodigy in painting; nature was his sole instructor, and her works his only models. Landscapes were the subordinate parts of his pictures; and he chose to bring into prominence those pastoral scenes where cattle could be shown browsing or ruminating. The bull and the cow, the sheep, the ass, and the goat, are rendered with surprising accuracy and skill. His colouring is clear and transparent; his execution firm, and finished without the appearance of effort. At the age of twenty he removed to the Hague, married, and remained about six years. He gained the acquaintance of Maurice, Prince of Orange, who liberally patronized him. The pressing invitation of Tulk, burgomaster at Amsterdam, induced him to remove to that city in 1652. Here he continued with the most untiring devotion to pursue, regardless of seasons, the study of those objects which came within the scope of his profession. He broke his health, and was attacked by pulmonary disease, which terminated his life in 1654, in the 29th year of his age.

POTTERY AND PORCELAIN.

The word *pottery* is said to be derived from the low Latin term *potus*, a pot, which is from the classical Latin *potus*, drink;[1] but the etymology of porcelain is more uncertain. Some writers derive it from *porcellana*, the Portuguese for a drinking-cup; others from a similar word in Italian, which is applied to a univalve shell of the genus *Cypræidæ*, or cowries, having a high arched back resembling that of a hog (*porco*, Ital.), and a white, smooth, vitreous glossiness of surface similar to that of fine porcelain. The essential ingredients of every article in pottery and porcelain are silica and alumina. The pure chemical compound, silicate of alumina, must, however, be regarded as an ideal type, unattainable even in the finest porcelain; while in the coarser varieties, and in pottery, impurities, such as iron, lime, potash, &c., give character to the resulting wares. Even if it were possible to obtain pure silica and alumina in sufficient quantities for manufacturing purposes, it would still be necessary to add certain substances to increase somewhat the fusibility of those refractory materials. Pottery is also distinguished by being opaque, while porcelain is translucent. Wares of either kind are further distinguished by the terms *soft* and *hard*, or, as the French term them, *tendre* and *dur*,—distinctions which relate as well to the composition of the ware as to the temperature at which it is made solid. Common bricks and earthenware vessels, pipkins, pans, &c., are soft; while fire-brick and crockery, such as queen's-ware, stone-ware, &c., are hard. Soft pottery, consisting of silica, alumina, and lime, admits of being scratched with a knife or file, and is usually fusible at the heat required merely for baking porcelain. Stoneware is composed of silica, alumina, and baryta, and may be regarded as a coarse kind of porcelain. Hard porcelain contains more of alumina and less of silica than the soft; it is baked at a stronger heat, and is more dense. Soft porcelain contains more silica than the hard, and is also combined with alkaline fluxes, so that its softness is manifested in being easily scratched and less able to resist a strong heat.

SECTION I.—HISTORICAL SKETCH.

Articles of fictile ware are at once the most fragile and the most enduring of human monuments. A piece of common pottery, liable to be shivered to pieces by a slight blow, is more enduring than epitaphs in brass and effigies in bronze. These yield to the varying action of the weather: stone crumbles away, ink fades, and paper decays; but the earthen vase, deposited in some quiet but forgotten receptacle, survives the changes of time, and even when broken at the moment of its discovery by the pick of the labourer, affords instruction in its fragments. In their power of traversing accumulated ages, and affording glimpses of ancient times and people, fictile articles have been compared to the fossils of animals and plants, which reveal to the educated eye the former conditions of our globe.

Clay is so generally diffused, and its plastic nature is so obvious, that the art of working it cannot be considered as above the intelligence of a savage; hence the production of articles in clay may be said to belong to every people and to all time. The first drinking-vessels would be sun-baked, and consequently very destructible; so that few articles would survive a single winter. A considerable period must have elapsed before the method of giving permanence to these articles by the action of fire was discovered; but it is chiefly to this discovery that we owe the preservation of so man ancient relics of the fictile art. The sun-dried bricks of

---

[1] *Pot* is said by Tooke to be the past tense of the verb to *pit*,—*i.e.*, to excavate or sink into a hollow.

Egypt, Assyria, and Babylonia, have, however, been preserved to this day, and "not only afford testimony to the truth of Scripture by their composition of straw and clay, but also by the hieroglyphs impressed upon them, transmit the names of a series of kings, and testify the existence of edifices, all knowledge of which, except for these relics, would have utterly perished. Those of Assyria and Babylon, in addition to the same information, have, by their cuneiform inscriptions, which mention the locality of the edifices for which they were made, afforded the means of tracing the sites of ancient Mesopotamia and Assyria with an accuracy unattainable by any other means. When the brick was ornamented, as in Assyria, with glazed representations, this apparently insignificant but imperishable object has confirmed the descriptions of the walls of Babylon, which critical scepticism had denounced as fabulous. The Roman bricks have also borne their testimony to history. A large number of them present a series of the names of consuls of imperial Rome; while others show that the proud nobility of the Eternal City partly derived their revenues from the kilns of their Campanian and Sabine farms."[1]

The excellent authority just quoted refers to the next step in the progress of manufacture, namely, that of modelling in clay the forms of the physical world, the origin of the plastic art, "to which the symbolical pantheism of the old world gave an extension almost universal." When stone and metal came to be used as materials for sculpture, clay was still employed for the elaboration of the model, and also for the multiplication of copies for popular use of celebrated pieces of sculpture. The invention of the mould caused the terra cottas of antiquity to be as widely diffused as the plaster casts of modern times. Among the Assyrians and Babylonians clay was used as a material for writing on. The traveller Layard discovered in the palace of Sennacherib a whole library of clay books, consisting of histories, deeds, almanacs, spelling-books, vocabularies, inventories, horoscopes, receipts, letters, &c. About 2000 of these clay books of the Assyrians have been discovered: they are in the form of tablets, cylinders, and hexagonal prisms of terra cotta.

Before the invention of the potter's wheel, clay vessels could have had but little symmetry of shape. The necessity for some such contrivance must have been early felt, and it was probably invented by several nations. It is represented on the Egyptian sculptures; it is mentioned in Holy Scripture; and was in use at an early period in Assyria. Mr Birch states, that "the very oldest vases of Greece, some of which are supposed to have been made in the heroic ages, bear marks of having been turned upon the wheel." The art of firing the ware is also of the highest antiquity. Remains of baked earthenware are common in Egypt in the tombs of the first dynasties, and the oldest bricks and tablets of Assyria and Babylon bear evidence of having passed through the fire. The oldest remains of Hellenic pottery owe their preservation to their having been fired. As the clay by this process is rendered porous and incapable of holding liquids, the necessity for some kind of glaze must have been early felt. Opaque glasses or enamels have been found in Egypt as old as the fourth dynasty, and both the Egyptians and the Assyrians seem to have preferred an opaque enamel to a transparent glaze, somewhat after the fashion of the modern *faience*. Numerous fragments testify to the use of glazing amongst the ancient Greeks and Romans. With respect to form, the Greek vases, by their beauty and simplicity, have become models for various kinds of earthenware; while the application of painting to vases has transmitted to us much information respecting the mythology, manners, customs, and literature of ancient Greece. Even the Roman lamps and red ware illustrate in their ornaments many customs, manners, and historical events.

As the pottery of different modern nations has its characteristic features, so the ancient pottery has its distinctions of time and place. It is impossible not to distinguish between the rude and simple urns fashioned by the early inhabitants of Great Britain and the more carefully finished specimens of the Roman conquerors of these islands. Then, again, the simple unglazed earthenware of Greece contrasts with the more elaborate Etruscan forms, the finest of which, however, are probably by Greek artists. Then, again, the red and black potteries of India contrast with the black and white potteries of North America, the latter being interspersed with fragments of bivalve shells. On the discovery of the extraordinary ruins in Central America, specimens of pottery were found which showed considerable advance in the art compared with the date assigned to these ruins, namely, 1000 B.C. The specimens had been formed without the assistance of the potter's wheel; but they are well baked, the ornaments are in different colours, and they are coated with a fine vitreous glaze, such as was unknown in Europe until within about ten centuries. The religious employment of earthen vessels in early times, and the custom of placing them in tombs as receptacles for medals, trophies, insignia, money, charms, rings, and votive offerings, has greatly assisted the studies of archæologists in modern times, and we can do no more in this brief sketch than refer to their useful labours.

Porcelain is of modern introduction into Europe, but it was known in China more than a century before the Christian era. The Chinese appear to have improved their art during four or five centuries, and then, supposing themselves to have attained perfection, they allowed the art to remain stationary. So completely was the manufacture identified with that nation, that on the introduction of porcelain into Europe by the Portuguese in 1518, it received the name of *china*, which it still partially retains. The Chinese continued to supply us with porcelain during many years. It was supposed that the fine clay or *kaolin* used in its production was peculiar to China, and that it was consequently hopeless to attempt to manufacture porcelain in Europe. The porcelain of Japan is only a variety of the Chinese.

While the Chinese were improving their manufacture, the art of making decorative pottery became lost in Europe amid the darkness which followed the overthrow of the Western Empire. The first symptoms of revival were due to the Mohammedan invaders of Spain, whose tiles of enamelled earthenware are to be seen in the Moorish buildings of Seville, Toledo, Granada, and the Alhambra. They are of a pale clay, "the surface of which is coated over with a white opaque enamel, upon which the elaborate designs are executed in colours."[2] The Spaniards acquired from the Moors the art of manufacturing enamelled tiles, or *azulegos* as they are called, and they still continue to be made in Valencia. The Moors also adorned their pottery with Arabic inscriptions, and with arabesque patterns resembling a lace veil in richness. The vase known as that of the Alhambra is of earthenware; the ground is white, the ornaments are either blue of two shades, or of gold or copper lustre.[3] The Moors continued to manufacture ornamental pottery until the time of their final expulsion from Spain at the beginning of the seventeenth century. This Hispano-Arabic pottery, as it is called, is the prototype of the Italian majolica, and was long confounded with it. Specimens of it are to be seen in several celebrated collections. The majolica, or enamelled ware of Italy, probably dates from the twelfth century. It is related that a pirate king of Majorca, about the year 1115, was besieged in his stronghold by an armament from Pisa, and being vanquished, the expedition returned to Italy laden with spoil, among which, it is supposed, were a number of plates of painted Moorish pottery, such specimens being found encrusted in the walls of the most ancient churches of Pisa. They appear to have been regarded as religious trophies. No attempt, however, was made to imitate them until the fourteenth century, when specimens of majolica, so called from the island of Majorca, were produced; they resemble the Moorish examples in having arabesque patterns in yellow and green, upon a blue ground. About the year 1451 the manufacture had become celebrated at Pesaro, the birthplace of Luca della Robbia, who is regarded by persons who set aside the foregoing origin of majolica as the inventor of this ware. He appears to have earned distinction as a sculptor when he took to working in terra cotta, and gave permanence to his productions by the invention of a white enamel. His Madonnas, Scripture subjects, figures, and architectural pieces are still prized by collectors. Mr Marryat refers to them as "by far the finest works of art ever executed in pottery." He is also "the founder of a school which produced works not much inferior to his own." Existing specimens are of a dazzling whiteness, and the glaze, after so great a lapse of time, continues to be quite perfect. The manufacture of majolica flourished during two centuries under the patronage of the House of Urbino. The first duke, Frederick of Montefeltro (1444) took a lively interest in the manufacture; his son established a manufacture at Pesaro, and the most eminent artists were employed in furnishing designs, a system of patronage which was maintained by succeeding dukes. There is a tradition that Raffaelle was employed in furnishing designs; whence majolica sometimes passes by the name of *Raffaelle ware.* But as the finest specimens do not date earlier than 1540, or twenty years after the death of that great artist, he was probably not directly concerned in the manufacture. But it is admitted that his scholars used his drawings in composing designs for the finest specimens. In the middle of the fifteenth and during part of the sixteenth century, many towns of Italy had become renowned for their majolica ware, of which the coarser specimens were named *mezza-majolica*, and the finer, however inappropriately, *porcelana.* The manufacture had attained its greatest celebrity between 1540 and 1560. After the last-named date the art began to decline, and the introduction of porcelain, properly so called, helped to complete its downfall. The caprices of fashion cannot be alone charged with the destruction of this beautiful art, since, so far as utility is concerned, a hard paste covered with a vitreous glaze, as in porcelain, must be very superior to a soft paste coated with a metallic glaze, as in the case of majolica. The best examples of mezza-majolica are distinguished by the beauty of their colour, and the perfection of their enamel glaze; the latter imparting to the yellow and white tints the metallic lustre of gold and silver. There is also a remarkable mother-of-pearl lustre, together with an iridescent ruby, peculiar to Pesaro and Gubbio. The most general colours used in the painting were blue and yellow, with their mixtures. The drawing is not so good as the colouring, until the so-called porcelana raised the art to its zenith. After the year 1560 the designs became more fanciful and grotesque, and the colours inferior. It must not, however, be supposed that the articles manufactured were ornamental only. During the whole reign of majolica ware, all kinds of common articles were produced, such as pilgrim's bottles, with holes in the bottom rim for the strap or cord by which the vessel was carried; various forms of vases, adorned with paintings, with handles in the form of serpents, and rims surmounted by grotesque figures of animals and fishes; fruit dishes, with embossed patterns in high relief; small plates for ices and sweetmeats; vases, for holding different kinds of wine, which could be poured out from one spout; small flasks, in the shape of lemons and apples; cups covered with tendrils or quaint devices; small figures of saints; jocose figures; birds, coloured after nature; painted tiles for walls and floors, &c. Some of the most interesting specimens of majolica are known as *amatorii*, and consist of vessels, plates, or deep saucers, containing the portrait and name of a lady; these were filled with fruits or sweetmeats, and presented as pledges of affection. The portraits not only perpetuate the female beauty of a former age, but also the costume by which it was sought to make that beauty more attractive. Some of the amatorii represent hands united, hearts a-flame, or pierced with darts, after the fashion of the modern Valentine. The painters who executed the designs were usually copyists, the design itself being furnished by an eminent artist. In some cases, however, the painters themselves were the artists, and are known by certain monograms and marks. Occasionally the painters bought the pieces ready prepared for painting, executed them at home, and took them to the kiln to be fired. In such cases, the piece is often marked with the name of the potter, as well as that of the artist. The custom of attaching signatures to the pieces is peculiar to some manufactories; those with names and monograms for the most part belong to Gubbio and Albino. Different towns had their distinguishing marks, and it was common to mark in blue characters on the back of the dish the subject of the design; but when a complete service was painted, only the principal piece was marked: it was also customary to introduce the arms of the family for whom the service was prepared.

[2] *A History of Pottery and Porcelain, mediæval and modern*, by Joseph Marryat, 2d edition, London, 1857.

[3] This vase is figured in Owen Jones' work on the Alhambra.

Majolica was introduced into Germany in 1507 by Hirschvögel of Nuremberg, but the manufacture does not appear to have survived him. It prospered better in France, where, under the name of *faience*,[1] it flourished under the patronage of Catherine de' Medici and her kinsman Louis Gonzaga. The latter established Italian artists in his dukedom of Nevers, and they were successful in producing enamelled pottery from native materials. Gradually as native artists succeeded the Italian ones, the classical designs of the latter were degraded, and the enamelled ware of Italy was represented only by the common faience of France. In the eighteenth century Nevers recovered her reputation, and became celebrated for the brilliancy of a dark blue enamel with white patterns upon common ware. A variety of enamelled pottery was also produced at Rouen: this attracted some notice; but the kind of ware which may be said to be peculiar to France is that known as Palissy ware. There is a good deal of romance mixed up with the life of the inventor of this ware. Bernard Palissy and his adventures, real or imaginary, have assisted in multiplying the number of those dangerous books which ascribe imaginary events to real characters. Palissy was born at the commencement of the sixteenth century, of poor parents; but nature had implanted within him a love of the beautiful, which became his teacher. He managed to acquire a knowledge of reading, writing, and land-surveying, by which last-named art he earned his livelihood. In the intervals of employment he was much given to the study of the Italian masters, and he was delighted to obtain work in painting images and designs on glass. This enabled him to gratify his taste for travel, and for studying natural objects. He became master of the chemistry and mineralogy of his day, such as it was. In 1539 he settled at Saintes as an artist, where he married. His attention was first directed to pottery by being shown a beautiful enamelled cup, and on proceeding to inquire into its mode of manufacture, he found that there were secrets connected with it, and especially with the composition of the enamel. He at once undertook a course of experiments on the subject, but without success. The desire to master the subject had, however, taken such possession of him, that during several years he devoted nearly all his time and means to this pursuit, in spite of the claims of his wife and family and the remonstrances of his friends. He borrowed money to enable him to construct a new furnace; and when too poor to buy fuel, he used his furniture instead. When unable to pay his assistant's wages, he gave him the coat from off his back. Thus, becoming every year more wretched than the preceding, the folly of sixteen years (as it would have been called had he failed) ended in a triumph. His *figulines* or rustic pottery became the fashion of the day, and his beautiful patterns were everywhere admired. The general style of his ware is marked by quaintness and singularity; his figures are usually chaste in form: the ornaments and subjects of a historical, mythological, and allegorical character are in relief, and coloured. His natural objects, with the exception of certain leaves, were all moulded from nature. His shells are those of the tertiary formation of the Paris basin; his fish are those of the Seine; the reptiles and plants are from the neighbourhood of Paris; and he made use of no foreign natural production. The colours are usually bright, and mostly confined to yellows, blues, and grays; sometimes extending to green, violet, and brown. Mr Marryat says that Palissy "never succeeded in attaining the purity of the white enamel of Luca della Robbia, or even that of the faience of Nevers." The *pieces rustiques* of this artist, intended to adorn the large sideboards of the dining-rooms of the period, are loaded with objects in relief. A favourite subject with him was a flat kind of basin or dish, representing the bottom of the sea, covered with fishes, shells, sea-weeds, pebbles, snakes, &c. We have also from the hand of this artist, ewers and vases with grotesque ornaments, boars' heads, curiously-formed salt-cellars, figures of saints, wall and floor tiles, &c. Mr Baring Wall speaks of Palissy as "a great master of the power and effect of neutral tints."[1]

---

[1] This term is supposed to be derived from the small town, now a village, of Faience, in the department of Var, which, as early as the sixth century, appears to have been celebrated for glazed pottery.

France is also celebrated for a fine ware known as *faience fine* and *grès cérame*. Some of the earliest specimens are known under the name of *renaissance*, or fine faience of Henri II. There are only thirty-seven pieces of this manufacture extant; and as twenty-seven of them have been traced to Touraine and La Vendée, it has been conjectured that the manufactory was at Thouars in Touraine. The material is a fine white pipe-clay, the texture of which is seen through the thin transparent yellow varnish. The patterns are engraved on the paste, and the hollows filled up with coloured pastes, so as to resemble fine inlaying, or chiselled silver works in *niello;* whence this ware has also been termed *faience à niello*. There are also beautifully-modelled raised ornaments: the articles are for the most part small and light, consisting of cups, ewers, and a vase with a spout for pouring, called a *biberon*. A single candlestick of this ware was sold a few years ago for L.220.

Germany had its enamelled wares as early as the thirteenth century, the secret of success being of course the discovery of a fine glaze. Ratisbon, Landschut, and Nuremberg thus became formidable rivals of the Arabs and the Italians. The distinctive characters of this ware are the fine green glaze, the complex form, the number and variety of ornaments, lightness, and good workmanship. Nuremberg also became famous for its large enamelled tiles used for covering stoves.

Holland, from its exclusive trade with Japan, was induced to imitate the Japanese porcelain. The chief seat of the manufacture was Delft; and the ware was known and esteemed in the sixteenth century by its fantastic design, good colour, and beautiful enamel—the latter being smooth and even, and slightly tinged with blue. The Japanese origin was seen in the monstrous animals of the *chimera* class, the three-ringed bottle, the tall shapeless beaker, and the large circular dish, which were long regarded in Europe as favourite ornaments; while the common articles were so generally distributed as to obtain for Delft the title of the "parent of pottery." The fine English wares introduced by Wedgwood and others were the means of injuring the trade of Delft.

In England, the first manufactory of fine earthenware is said to have been erected in the reign of Elizabeth at Stratford-le-Bow. The well-known Shakspeare jug is cited as a good specimen of Elizabethan pottery. It is of cream-coloured earthenware, about 9 inches in height and 16 in circumference in the largest part. Its shape resembles that of a modern coffee-pot. It is divided lengthwise into eight compartments, each containing a mythological subject in high relief and of considerable merit. The silver top is a modern addition. The Elizabethan pottery nearly approaches in hardness that of fine stoneware; it is of a dingy white, and its ornaments in relief consist mostly of quaint figures and foliage. In the reign of Elizabeth the Staffordshire potteries came into notice, of which some of the earliest specimens consist of butter-pots of native brick earth, glazed with powdered lead-ore, which was dusted on while the ware was in a green state; the *tig*, or drinking-cup, with three handles; and the parting-cup, with two handles. In 1684 a manufactory of earthenware was established at Fulham, some of the products of which, under the name of *Fulham-ware*, are still valued by collectors. They consist of white *gorges* or pitchers, marbled porcelain vessels, statues, and figures. The proprietor, Mr John Dwight, attempted to produce the transparent porcelain of China, but his success was not such as to turn him from the more profitable manufacture of earthenware. About the time of the Revolution, ale-jugs of native marl, ornamented with figures in white pipe-clay, were introduced. During the reigns of Anne and George I. an improved ware was made of sand and pipe-clay coloured with oxide of copper and manganese, forming the well-known *agate-ware* and *tortoiseshell-ware*, conferring on the pottery the character of a hard paste, which was subsequently so much improved by Wedgwood, and introduced under the name of *Queen's ware*.

The proceedings of Wedgwood form an epoch in the history of the art. Josiah Wedgwood was the son of a potter at Burslem in Staffordshire. He was born about the year 1730, and can scarcely be said to have received any formal education. At the age of eleven he entered his brother's pottery as a thrower; but he had not been long so engaged before he was attacked by small-pox, which left him with a lame leg, and rendered amputation necessary. His first attempts to settle in life were not fortunate; he became partner for a short time in 1752 with a man named Harrison, at Stoke, where he is said to have first felt a strong desire to manufacture ornamental pottery. His next partner was named Wheildon, and his employment consisted in manufacturing knife-handles in imitation of agate and tortoiseshell, melon table-plates, green pickle-leaves, &c.; but he could not induce his partner to embark largely in the production of ornamental wares, nor was there much encouragement to do so. The upper classes of Great

[1] *Lecture delivered before the Literary and Scientific Society of Salisbury*, January 1853. Printed for private circulation.

Britain obtained their porcelain from China; the great bulk of the earthenware in domestic use was supplied by France, Germany, and Holland; and even the trade in tobacco-pipes, in which this country had attained some success, was becoming monopolized by the Dutch. To compete with these formidable rivals required the courage and persistence of genius; and Wedgwood was not slow in bringing them to bear upon the native materials which surrounded him. Accordingly, in 1759 he established a small factory on his own account at Burslem. Here he must have been successful, for he soon undertook a second manufactory, where he produced a white stone-ware, and afterwards a third, where he manufactured his celebrated *cream-coloured ware*. Some specimens of the latter having been shown to Queen Charlotte, her Majesty was so pleased with them that she appointed Wedgwood the royal potter, and gave permission for calling the ware "Queen's ware." Wedgwood had now no longer reason to complain of want of taste or of patronage on the part of the public, and nobly did he use his best exertions to encourage the one and respond worthily to the other. He studied the chemistry of his day, and courted the society of scientific men, with a view to improve the composition, glaze, and colour of his wares. He invited good artists to furnish him with designs, among whom was the celebrated Flaxman. Among Wedgwood's inventions may be mentioned a *terra cotta*, resembling porphyry; *basalts*, or black ware, which would strike sparks like a flint; *white porcelain biscuit*, with properties similar to basalt; *bamboo* or *cane-coloured biscuit; jasper*, a white biscuit, of exquisite delicacy and beauty, well adapted for cameos, portraits, &c.; also *blue jasper* and *green jasper*, and a *porcelain biscuit* little inferior to agate in hardness, and used for pestles and mortars in the laboratories of chemists. He also succeeded in imparting to hard pottery the vivid colours and brilliant glaze of porcelain. About the year 1762 Wedgwood opened a warehouse in London, and entrusted it to the care of Mr Bentley, a gentleman of recognised taste, who succeeded in attracting attention to the rising Staffordshire works, and also in obtaining the loan of vases, cameos, oriental porcelain, &c., which at that time were difficult to procure, especially for the purposes of the manufacturer; but such was the sympathy of persons of taste with Wedgwood's pursuits, that they freely lent their fictile treasures either to be copied or to suggest new designs. Even the Barbarini vase, which was purchased by the Duchess of Portland for 1800 guineas, was lent to Wedgwood, who, after executing fifty copies, destroyed the mould. Wedgwood's wares now became so deservedly popular that the extension of his works in Staffordshire led to the formation of a new village near Newcastle-under-Lyne, which was named "Etruria," from the resemblance which the clay dug there had to the ancient Etrurian earth, and also probably to mark the success with which Wedgwood had imitated the ancient Etruscan ware. This village long continued to be a centre of attraction for travellers from all parts of Europe, and we may still trace that celebrity in many noted collections of the ceramic art, Wedgwood's finest productions taking rank with the choicest specimens of Dresden and Sèvres. Wedgwood died at his mansion in Etruria in 1795.

The stone-ware which Wedgwood so greatly improved had long existed under various forms in different potteries of the world. In some cases it was common, and in others fine—the difference consisting in the composition of the paste. The Chinese were acquainted with this ware, and were accustomed to use it as the basis for a surface of porcelain paste. The stone pottery of the Rhine of the sixteenth century is esteemed by collectors for its quaintness of form, richness of ornament, and the colour of its enamel. *Grès Flamand*, or Flemish stone-ware, of the period between 1540 and 1620 is remarkable for its beautiful blue colour, quaint forms, and rich ornaments. France also appears to have manufactured stone-ware before the sixteenth century. In England, Dutch and German workmen were engaged in the manufacture at an early period. In 1690 the mode of glazing by means of common salt enabled the stone-ware manufacturers to compete successfully with delft and soft paste fabrics. Towards the end of the seventeenth century a very fine unglazed stone-ware, with raised ornaments, known as red Japan ware, was made in England, after the failure of many previous attempts. It appears that two brothers named Elers, from Nuremberg, discovered at Bradwell, about 2 miles from Burslem, a bed of fine red clay, which they worked at a small factory erected on the bed itself. They endeavoured to conceal their discovery, as well as their mode of working, for which purpose they employed the most ignorant assistants that they could meet with; but no sooner did their ware attract attention than a potter named Astbury, feigning to be an idiot, entered the service of the two brothers, and, having learnt all their secrets, established a factory for himself: the processes soon became known, and others followed the example. In 1720 the two brothers closed their establishment, and entered the porcelain manufactory at Chelsea. Mr Marryat characterizes their ware as being fine in material and sharp in execution, the ornaments being formed in copper moulds.

Regarding stone-ware as a connecting-link between earthen-ware and porcelain, we come now to the history of the latter article. China, Japan, and Persia are the earliest nations which produced this beautiful material. Bottles of Chinese manufacture have been found in the tombs of Thebes; and from an inscription on one of them, the date of the manufacture would appear to be between 1575 B.C. and 1289 B.C. The workmanship, however, is inferior. Porcelain seems to have been common in the Chinese empire in the year 163 B.C., and to have attained its greatest perfection in the year 1000 A.D. The porcelain tower near Nankin was erected in 1277. Marco Polo describes the manufacture in China during the thirteenth century. Specimens of the ware had gradually found their way to Europe, but were not generally known until the Cape of Good Hope had been doubled by the Portuguese. The latter were so struck with the resemblance between the texture of this fine ware and that of cowrie-shells or "porcellana," as they were called, that they imagined that the ware might be made of such shells, or of a composition resembling them, and named it accordingly. They imported numerous and splendid collections of the ware into Europe, where it was also named from the country which produced it; and, from its ringing sound, "China metal." It was also called "China earth." On the expulsion of the Portuguese, the Dutch succeeded in establishing a traffic with India and Japan; and Europe was for a long time supplied with porcelain through Holland. The English shared in the trade somewhat later, through the medium of the East India Company; but the taste for collecting china had become very general, and about the middle of the seven teenth century had amounted to a passion. The writers of the day frequently refer to it, especially in Queen Anne's reign. The French, who had established missions in China, succeeded in obtaining, from time to time, information respecting the manufacture. Fokien was represented as the seat of manufacture of the pure white porcelain of China, some of which consists of small cups and similar articles, with inscriptions, devices, &c., under the glaze, so that they can only be seen by holding the article up to the light. Nankin produced the blue and white porcelain, as also the pale buff on the necks of bottles and backs of plates. King-te-tching was named as the origin of the old sea-green and crackle porcelain. To the former the term *céladon* has been applied; but the French extend the term to porcelain of any tint in which the colours are mixed with the glaze, and burnt in at the first firing. In some cases two or more colours are blended so as to give the appearance of shot-silk; a variety, known as *marbled*, belongs to this class, and resembles marble in its colouring and veining. Crackle china, in which an immense number of cracks occur on the surface in small regular figures, is due to the unequal expansion of the glaze on the paste. The crackled "tsouï-khi" are produced by combining steatite with the glaze; and this when fired, splits into a net-work over the surface. A similar effect can be produced by plunging the heated porcelain into cold water; the cracks are then filled in with a thick ink or red-ochre. The ancient crackle is so much esteemed in Japan that as much as L.300 has been paid for a single specimen. The Chinese call this ware *snake-porcelain;* and the French apply to it the term *porcelaine truitée*. But the perfection of the ceramic art among the Chinese is exhibited in their egg-shell porcelain, which is thin and transparent, and resembles an egg-shell in appearance. This ware is coloured citron-yellow for the exclusive use of the emperor, and ruby for the use of the imperial family. The porcelain in common use in China is brown, the inside being white, and white medallions outside. There is also an inferior and more modern porcelain, manufactured at Canton, and known as Indian china. But in all the specimens of Chinese porcelain, however beautiful may be the material and delicate the texture, however brilliant the colour and pure the glaze, the form and the design are hideous. It has been remarked that the vase of the humblest Greek potter of the best period has an æsthetic value far surpassing the most costly productions of the Celestial Empire. The porcelain of Japan is in better taste than that of China, the dragons being less monstrous and the flowers more natural.

After the introduction of Chinese porcelain into Europe, many attempts were made during two centuries to imitate it. The first successful experiment was the result of one of those accidents which are doubtless of frequent occurrence, although the quality of mind required to take advantage of them is rare. John Frederick Böttcher was an apothecary's assistant at Berlin: he was fond of chemistry, and conducted his experiments with so much ardour that the authorities could not resist the conclusion that he was practising the black art. He found it convenient to make his escape from Berlin and to visit Dresden, where the Elector of Saxony, Augustus II., patronized chemistry, not from the love of science, but from that of gold. Böttcher claimed the protection of the elector, who eagerly inquired of him respecting the transmutation of the baser metals. With the natural frankness of his character, Böttcher confessed his ignorance, but was disbelieved. Why should a man study chemistry except to enrich himself? it was argued; and as the elector was already patronizing the alchemist Tschirnhaus in his endeavours to discover the art of transmuting old age into youth, by means of the *elixir vitæ*, he associated Böttcher with him, with strict orders not to let him out of his sight. Böttcher was employed to seek after the philosopher's stone; and in the course of his experiments he made some crucibles, which, on being fired, possessed many of the characters of oriental porcelain. The vessels were made from a brown clay found near Meissen, and they were of a reddish tint. When the result was brought before the elector he appreciated its importance; and in order that Böttcher might pursue the inquiry in secret, he sent him to the castle of Albrechtsburg, near Meissen, where he was magnificently entertained, but restrained in his personal liberty. So much importance was attached to the secret, that during the troubles consequent on the invasion of Saxony by Charles XII. of Sweden, Böttcher, Tschirnhaus, and three workmen, were sent to the fortress of Königstein on the Elbe, where a laboratory was prepared for them. Böttcher's fellow-prisoners formed a plan of escape, which he communicated to the commandant, whereby he gained favour and a little more personal liberty. In 1707 he returned to Meissen, where he continued to prosecute his experiments, delighting every one around him with his active cheerfulness, and keeping up the spirits of the workmen during the furnace operations, which sometimes lasted sixty hours consecutively. Tschirnhaus died in the following year, and Böttcher enlarged the scale of his operations; he caused a new furnace to be erected, and extended the time of firing to five days and five nights. The elector was present at the opening of the furnace, and expressed his satisfaction at the progress which was being made. Up to this time, however, the only result was a kind of red and white stone-ware; and when, in 1709, Böttcher succeeded in producing a white porcelain, it became bent, and cracked in the fire. The progress, however, was deemed to be sufficient to determine Augustine to establish a manufactory at Meissen, and to appoint Böttcher the director. In 1715 the new factory produced a beautiful description of porcelain by means of the kaolin of Aue in the Erzgebirge, the discovery of which was made by an ironmaster of the district named Schnorr. This man had observed, while riding near the place, that his horse's feet stuck in a soft white tenacious earth, and it occurred to him that if this earth were dried and reduced to powder, it would make a good substitute for hair-powder, which the fashion of the day required, all except the poor, to use. Accordingly he manufactured the powder in large quantities, and found a ready sale for it in Dresden and elsewhere. Böttcher's valet used it, and so increased the weight of his master's wig as to lead to inquiry; and finding that the new hair-powder was of mineral origin, the idea flashed across his mind that this white powder might be useful in his experiments. He made the attempt, and was delighted to find that he had at length discovered the long wished-for material for making white porcelain. The secret so curiously obtained was for a long time as carefully guarded. The powder was made to retain its commercial name of "Schnorr's white earth" (*Snorrische weisse Erde*), its export was forbidden, and it was introduced into the factory in sealed barrels by persons sworn to secresy. All persons connected with the factory were obliged to take a similar oath: no visitor was admitted; and the factory was regulated after the manner of a fortress. The motto in large letters, "Be secret unto death" (*Geheim bis ins Grab*), was set up in each room; the oath to the workmen was renewed every month; and when the king or any distinguished visitor was allowed to enter the factory, a similar obligation was imposed on him.

But all this parade of secresy would make it clear to the most ill-informed workmen that the secret had a high marketable value, and we cannot wonder that it should have been sold to one or other of the monarchs of Europe, most of whom were ambitious to manufacture oriental porcelain. Böttcher died in 1719, at the age of thirty-seven, but before his premature death, a foreman had escaped from the factory, and proceeding to Vienna, submitted to be bribed, and it was not long before rival factories sprang up in different parts of Germany. A few years ago the writer visited the Meissen factory, which is pleasantly situated on the banks of the Elbe: it still retains something of its fortress character, although the workshops are light and cheerful. The principal room is adorned with the bust of Böttcher. The factory, however, has lost its former vigour: an air of lassitude seems to pervade the place, and neither here nor at Sèvres are we impressed with the idea that the work is being done in earnest, as it is at such an establishment as Minton's at Stoke-upon-Trent. There can be no doubt that private enterprise, unshackled by state restrictions, is the only healthy condition of the useful arts. A royal factory, which can neither become bankrupt nor meet with the wholesome stimulus of competition, is not likely to be worked at a profit, nor to inspire activity in its attendants.

The temporary success of the Meissen factory depended on the singularity of its position. There was a great demand in Europe for fine porcelain, and Meissen was in a condition to supply it. The first productions of the factory were mostly imitations of oriental patterns, but they were deficient in grace and lightness. There was a marked improvement when Kändler, a professional sculptor, was appointed in 1731 to superintend the modelling. He introduced wreaths and bouquets, animals and groups of figures, with the feeling of an artist. The works were arrested by the Seven Years' War; but after this calamity Meissen became celebrated for its exquisite miniature copies of the best works of the Flemish school, together with birds and insects, painted by Lindenir, and flowers and animals by the best artists. In 1745, when Frederick of Prussia took possession of Dresden, he obtained among the spoils of war enormous quantities of porcelain. He also removed to Berlin some of the workmen, together with the models and moulds of the finest pieces. Again, in 1759, the factory was plundered and its archives destroyed: it revived somewhat under Dietrich the painter, Lüch the modeller, Breicheisen, and the sculptor François Acier. Gradually, however, the factory ceased to be profitable, and was for many years maintained at a loss; when some years ago the king gave it up to the finance department of the state. The finest works of art are no longer produced; and it is also stated that the beds of fine clay in the neighbourhood are nearly exhausted, and that an inferior material from Zittau is used instead.[1] Various marks were placed on the wares at different periods: the first mark consisted of the letters A. R. (Augustus Rex), and was placed on all pieces not intended for sale. The well-known mark of the electoral swords, crossed, also distinguishes Dresden china. Fac-similes of these marks, and of the marks and monograms of other celebrated European potteries, are given in Mr Marryat's work.

Among the best of the Dresden works are groups from antique models; lace figures, so called from the fineness of the lace-work in the dress; flowers, evidently studied from nature; and vases richly adorned and encrusted, forming what is called *honey-comb* china. But even during the palmy time of this manufacture, namely, from 1731 to 1756, the productions were sometimes disfigured by the highly artificial taste of the age. Thus, in the Ceramic Court of the Crystal Palace, we have lately examined some curious specimens of *basket-ware*, resembling large wicker baskets, with numerous handles and small wicker doors opening at the side and moving on hinges. We may perhaps be allowed to repeat in this place some observations which we have made on one of these productions elsewhere:—"A certain ideal finish is given to the work by resting it, as it were, upon a bed of flags, whose lanceolated foliage rises up gracefully, and constitutes indeed the only pleasing part of the production, affording as it does a refreshing glimpse of nature amidst the embarrassments of art. Those only who are acquainted with the practical details of this manufacture can be at all aware of the enormous difficulties of forming one of these baskets, and passing it successfully through the furnace; and when the results have been successful, as in the cases before us, we have an infringement of one of the soundest canons of art,—namely, not to imitate an inferior material in a superior."

The first rival of Meissen was the porcelain factory of Vienna, which originated in 1720, in consequence of the perjury of a Meissen workman, as already noticed. The factory does not, however, appear to have flourished until warmed into life by the patronizing smiles of Maria Theresa in 1744, and of the Emperor Joseph. The porcelain of Vienna holds a lower rank than that of Dresden or of Berlin. It is not so light as that of Dresden, and the glazing has a grayish tint. Its chief feature is its raised and gilded work, which are in good taste, and of late years the application in relief of solid platinum and gold. The works are now in private hands, and the chief markets for the sale of the ware are in Turkey, Russia, and Italy.

As the Vienna works were based on treachery, so was the next important establishment based on the defection of a Viennese workman. A celebrated pottery was already in existence at the village of Höchst on the Nidda, when in 1740 a man named Ringler undertook to superintend the manufacture of porcelain if the proprietors would introduce it. This man appears to have been simply a knave without skill or invention: he had committed to writing the various processes of the Vienna establishment, and concealing his manuscript about his person, consulted it every time he had to give out materials to the workmen. As knavery propagates itself, the workmen, taking advantage of Ringler's fondness for wine, invited him to a feast, where they made him helplessly drunk,—when they robbed him of his papers, carefully copied his recipes, and then decamped to other parts of Germany, where they sold the secrets to those who were anxious for their possession. Hence originated from one source the porcelain factories of Switzerland, of the Lower Rhine, of Cassel, and even of Berlin. The Fürstenburg works, in the duchy of Brunswick, originated in a bribe offered by one of the dukes to a Höchst workman. The works at Frankenthal in Bavaria originated in a pottery which was visited by Ringler after he had been plundered of his papers. The factory of Nymphenburg in Bavaria had a similar origin. The porcelain of this factory is much esteemed, many of the designs having been furnished by the celebrated picture gallery of Munich. A factory at Baden was conducted by some of the Höchst workmen until 1778. The factory of Ludwigsburg, begun in 1758 under the patronage of the Duke of Wirtemberg, has executed some beautiful works, which are known as *Cronenburg* porcelain, from the town of that name, and the mark CC on its wares. The distance from which the clay and the fuel had to be procured prevented the success of this establishment. The porcelain factory of Berlin was first undertaken in consequence of the information supplied by the men who robbed Ringler; but it was not very successful until a more magnificent fraud had been perpetrated, namely, the transference of the best of the work-people, and the material of the Meissen factory, as already referred to. The Berlin porcelain was, of course, only an imitation of the Dresden, but the factory was carried on with such vigour as to yield to the king an annual revenue of 200,000 crowns. In 1790 a second royal porcelain factory was established about 2 miles from Berlin. To one of Ringler's fraudulent comrades is also due the factory established at Fulda, about 1763. The prince-bishop of Fulda established another factory in a house adjoining the episcopal palace; but it is said to have failed in consequence of the taste for porcelain extending to the dignitaries of the church, who claimed the privilege of carrying off specimens without paying for them. The porcelain factories of Thuringia originated about 1758, when an old woman having sold some sand at the house of the chemist Macheleid, his son, struck by its appearance, experimented on it, and obtained by its means a porcelain-looking substance, whereupon the Prince of Schwartzburg sanctioned the erection of a factory at Sitzerode, which was afterwards removed to Volkstadt. The abundance of fuel supplied by the Thuringian forest led to the erection of other factories, such as that of Wallendorf in Saxe-Coburg, Limbach in Saxe-Meinengen, the director of which succeeded so well as to be able to purchase the factory at Grosbreitenbach in Rudelstadt, and also that of Kloster Veilsdorf. Factories were also founded at Gotha in 1780, at Hildburghaus, at Anspach, at Ilmenau, at Breitenbach, and at Gera. All these factories had their periods of prosperity, and produced porcelain which is still esteemed by collectors. Some of them have degenerated into potteries, and some produce pipe-bowls as their only article in porcelain. Nor will our list approach completeness without mentioning a factory established by the Empress Elizabeth in 1756, near St Petersburg, which still continues to produce good porcelain from native materials. Denmark has a factory at Copenhagen; it is supported by the government, but is said to be, commercially, a failure. The factory at Zurich in Switzerland was established on the information supplied by one of Ringler's workmen. A factory at Nyons, in the Canton de Vaud, has also produced some good porcelain.

---

[1] This statement is made on the authority of Mr Marryat; but at the time we are writing an account is given in the German papers of an order from Paris having been executed at Meissen, consisting of portraits of the Emperor and Empress of the French, of a medallion shape, and inclosed in a rich porcelain frame. According to the German critics, "these are the finest works of art which porcelain painting has yet produced." If this criticism be true, or even partially true, the Meissen works must have experienced an extraordinary revival.

During all this active rivalry on the Continent it will not be supposed that England had escaped the porcelain-making mania. Bow and Chelsea produced the first porcelain works. They made a soft ware from a mixture of white clay, white sand from Alum Bay, and pounded glass. The Chelsea works do not appear to have been in a very flourishing condition until George II. imported workmen, models, and materials from Brunswick and Saxony. Chelsea porcelain then became the rage, and such was the eagerness to obtain it, that it was sold by auction to the highest bidders, the dealers rushing in crowds to compete for it. Some of the best works were produced between 1750 and 1755: they are in the style of the best German; the colours are fine and vivid, and the claret colour is peculiar. Bow china, made at Stratford-le-Bow, has some resemblance to that of Chelsea, but the material is not so good. Its principal productions were tea-services and dessert-sets. In 1750 was established the factory at Derby, which became important in consequence of the introduction of the Chelsea artists, workmen, and models, the junction of the two factories being notified by the anchor and the letter D, the monograms of each manufacture. Flaxman furnished designs for the establishment; but the union did not continue long; the partners quarrelled, and one of them destroyed the models. Mr Marryat describes the Derby procelain as being very transparent, of fine quality, and distinguished by a beautiful bright blue, often introduced on the border or edge of the tea-services, the ground being generally plain; the white-biscuit figures are said to equal those of Sèvres. The Worcester works were established in 1751 by Dr Wall and some others, under the name of the Worcester Porcelain Company. The company first imitated the blue and white Nankin china; they afterwards adopted the Sèvres style, with the Dresden method of painting. These works are remarkable as being the first to make use of the Cornish stone or kaolin, discovered by Cookworthy in 1768. They are still carried on with distinguished success by Messrs Kerr and Binns. In 1772 a factory was established at Caughley, near Broseley, Colebrook Dale, the productions of which are known as *Salopian ware.* Early in the present century some good porcelain was made at Nantgarrow and Swansea; it is also stated that the Bristol china, a white ware formerly common in the west of England, was made in Wales, and sold in Bristol. We cannot conclude this bare mention of English porcelain without naming such firms as Minton & Co., Copeland & Co., at Stoke-upon-Trent. We have referred elsewhere to their works (in reviewing the collections in the Ceramic Court of the Crystal Palace), in the following terms:—"The tea-services of Messrs Minton are beautiful and delicate in form, exquisite in device, and rich in colour, and contrasting with their porcelain vases, flower vases, and enormous majolica vases, would seem to illustrate the beautiful and the sublime in the fictile art. We have also some exquisite busts manufactered by Copeland from porcelain earth, such as the bust of Clytie, reduced from the original in the British Museum, a form of art which cannot be too highly commended, since there is nothing more touching to the thoughtful mind than to be brought face to face with the worthies and celebrities of the past."

France regarded with impatience during sixty years the progress of porcelain in Europe, and although eminently qualified in point of taste, skill, and science to contribute to the ceramic treasures of the world, she was unable to compete with other nations for want of a suitable raw material. It is true that as early as 1695 a soft porcelain had been manufactured at St Cloud, and that some of the scientific men of France had endeavoured, under royal patronage, to discover the secrets of the art, but no great success was attained. The company had been established at Vincennes, but in 1756 they removed to a large building which they had erected at Sèvres. In 1760 Louis XV. bought up the establishment, probably at the instigation of Madame de Pompadour, who seems to have shared with her sex the passion for china. The factory became celebrated for its soft porcelain or *pâte tendre*, but the great point aimed at was to produce the hard porcelain which had rendered Saxony the envy of Europe. But kaolin was not known in France, nor was its presence even suspected, until about 1768, when the wife of a surgeon named Darnet of St Yrieix, near Limoges, having noticed in a ravine near the town a white unctuous earth, thought that she might relieve her husband's poverty somewhat by using it in her house instead of soap. The surgeon showed a portion of the substance to an apothecary of Bordeaux, who being aware of the search that was being made for porcelain earth, forwarded a specimen to the chemist Macquer, who recognised it as the much-desired kaolin. Assuring himself that an abundant supply could be had, he established the manufacture of hard porcelain at Sèvres in 1769. At first some difficulty was experienced in managing the colours upon the more compact and less absorbent material, so that the soft porcelain continued to be made until the year 1804.

Such, in few words, is the origin of the hard porcelain of Sèvres. The *pâte tendre* was not considered as real porcelain, but the taste and skill of the French are remarkable in carrying it to the highest pitch of perfection under many difficulties, arising from its complicated and expensive composition, and from its liability to collapse during the firing. Mr Marryat speaks of it as being "remarkable for its creamy and pearly softness of colour, the beauty of its painting, and its depth of glaze." The ware for common or domestic use had generally a plain ground, painted with flowers in patterns or medallions; articles *de luxe*, and pieces intended for royal use, had commonly grounds of various colours, such as *bleu de roi*, *bleu turquoise*, *jonquille*, or yellow, *vert-prés*, or green, and a lively pink or rose colour, named after Madame Dubarry. Skilful artists were employed upon the finest porcelain, which is adorned with landscapes, flowers, birds, boys, and Cupids gracefully arranged in medallions. Some of the specimens are painted with subjects after Watteau, and other known masters. The jewelled cups, with the *bleu de roi* ground are celebrated. The best period of the soft porcelain was from 1740 to 1769, and the tests which Mr Marryat gives to distinguish it form its highest praise, namely, "the beauty of the painting, the richness of the gilding, and the depth of colour." In point of form the Sèvres china is not equal to that of Dresden. A law was passed in 1766, and renewed in 1784, limiting the use of gold in the decoration of porcelain to the royal manufactory of Sèvres, which accounts for the rarity of old French gilded porcelain.

At the time of the Revolution many fine specimens of Sèvres porcelain in the royal palaces and mansions of the nobility were destroyed. The establishment of Sèvres, however, was supported by the revolutionary government, who appointed three commissioners to manage it. In the year 1800 the first consul appointed M. Brongniart as director. He held the appointment during forty-seven years, and originated the celebrated *Musée Céramique*, consisting of a historical series of specimens illustrative of the ceramic art in all times and among all people, together with a collection of raw materials, tools, implements, trial-pieces, models of furnaces, &c. On our visit to this museum, we were particularly struck with a collection of *failures*, or specimens showing what had been done to overcome faulty results, and what it was hopeless to attempt. M. Brongniart is also the author of a classical work on the art to which he devoted his life with such distinguished success.[1] M. Ebelman succeeded Brongniart as director, and held the appointment for a year or two. The present director, M. Regnault, was appointed by the Emperor Napoleon III.

The following is a list of the more celebrated porcelain manufactures of France :—Chantilly, which owed its origin in 1735 to a workman from St Cloud; Menecy, founded in 1735 under the patronage of the Duc de Villeroi; Sceaux-penthièvre, established in 1751; Clignancourt, 1750, under the patronage of the Duke of Orleans; Etiolles, near Corbeil, 1766; Bourg la Reine, Paris, 1733. Lille, established, it is supposed, in 1708, when the Dutch were masters of the town; Arras, 1782; Tournay, 1750. At St Amand les Eaux, near Valenciennes, and at Tournay in Belgium, are two factories, the only two in Europe where the old *pâte tendre* of Sèvres is still produced.

As respects Italy, a factory was established at Doccia, near Florence, at the beginning of the eighteenth century. Venice also manufactured porcelain until 1812. There was also a factory at Vineuf, near Turin; but the most famous factory in Italy is the Capo di Monti at Naples, founded by Charles III. in 1736. This sovereign appears to have excelled the other royal amateurs of Europe in the ardour with which he cultivated the ceramic art, and he even surpassed Augustus III., who was nicknamed by Frederick of Prussia "the Porcelain King," and who exchanged a whole regiment of dragoons for some huge useless china vases. Charles III. even worked in the factory with his own hands, and held an annual fair in front of the royal palace at Naples, where there was a shop for the sale of the royal productions; and there was no more certain road to the king's favour than to become a purchaser. When Charles became king of Spain he founded a factory at Madrid, and that at Naples declined. His successor Ferdinand sanctioned the erection of other porcelain works, and allowed the royal workmen to assist in their formation; and they appear not only to have assisted but to have robbed the parent factory of its gold and silver models and other valuables. The royal factory was closed in 1821. The porcelain of Capo di Monti is not, as is commonly the case, an imitation of that of some rival factory. Its beauty and excellence are due to the design from shells, corals, embossed figures, &c., artistically moulded in high relief. Mr Marryat regards the tea and coffee services of this ware as perhaps the most beautiful porcelain articles ever produced in Europe, for transparency, thinness of the paste, elegance of form, and gracefully-twisted serpent handles, as also for the delicate modelling of the ornamental groups in high relief, painted and gilt, contrasting well with the plain ground. The factory at Madrid was conducted with the utmost secresy during several reigns, but was destroyed by the French in 1812. Portugal has a factory of hard porcelain near Oporto.

The prices paid for porcelain are high. As much as L.150 has been paid for a single specimen of majolica; while a service of Chelsea ware has cost L.1200. One of Sèvres, of a good period, 30,000 livres; while the Dresden ware was equally costly. Although our modern manufacturers have produced porcelain rivalling that of the best periods of celebrated works, the price still continues to be necessarily high, where the materials require to be treated with the precision of a chemical process, and the design and ornamentation require high artistic skill. Mr Minton received L.1000 for his service of turquoise and Parian; Lord Hertford gave L.1000 for two vases; Mr Mills the same; one of the Queen's vases has been valued at L.1000, and Lord Ward gave L.1500 for a dessert service of Sèvres. Such works as these, however, belong rather to the fine arts than the useful arts, to be preserved in cabinets and museums. Formerly it was customary on great occasions to serve the guests on porcelain, which gave to wealth a real distinction. In those days the transition from porcelain to earthenware was abrupt; but through the exertions of Wedgwood and others, porcelain now descends through numerous varieties of material, style, taste, and decoration; so that every class of consumer may suit his own taste and means. Our trade in earthenware has of late years gone on increasing. In the year 1835 the declared value of earthenware exported from the United Kingdom was L.540,421; in the year 1857 it amounted to L.1,488,668. Our exports extend to most parts of the world, including Russia, Austria, Turkey, and even France. The United States of America take nearly the half of our exports in earthenware, so little has the potter's art been encouraged in the New World. Our exports to foreign countries would doubtless be larger if the restrictions were fewer and less clumsy. In Germany and Italy the duty is levied on the weight; so that Wedgwood, on account of the lightness of his ware, was long able to command the market in those states. In France the duty on common English china of one colour, without gilding or ornament, is 164 francs per 1000 kilogrammes (200 lb.); for fine china, 327 francs for the same quantity. The most whimsical of all tariffs is that of Portugal, where the charge is according to the number of colours; so that, as Mr Wall remarks, "no man's pocket could stand the choice of a rainbow pattern."

SECT. II.—THE MATERIALS.

Clay, which forms the basis of pottery and earthenware, is not only abundant and widely diffused, but presents so many varieties that much experience and judgment are required in adapting the kind of clay to the article to be manufactured. Brongniart enumerates 167 varieties of clay, and states their physical and chemical characters, composition, locality, and application.[2] Some of the commonest varieties of clay consist of—1. *Pipe-clay.* It has a grayish-white colour, a smooth greasy feel, an earthy fracture; it adheres to the tongue, and is plastic, tenacious, and infusible. It becomes of a cream colour when fired; and is used for tobacco-pipes and white pottery. It is found near Poole in Dorsetshire.—2. *Potter's-clay.* This is of various colours; those used in the Staffordshire potteries are the *brown* and *blue* clays from Dorsetshire,[1] and black and cracking clays from Devonshire. The colour of the black clay is due to bitumen or coaly matter, which disappears in passing through the kiln; so that the wares formed of it are almost white. Cracking clay is esteemed on account of its whiteness, but as it is liable to crack during the firing, it must be mixed with other clays which are free from this defect. Brown clay when passed through the gloss oven sometimes causes the glaze to crack, or *craze*, as it is called. For ordinary purposes blue clay is preferred; it can be mixed with a larger proportion of flint than the other varieties, and thus produces a white ware. Potter's clay, mixed with sand, is formed into bricks and tiles.—3. *Stourbridge clay.* This is of a dark colour, from the presence of carbonaceous matter, and from its being more refractory than potter's clay, it is largely employed for glass pots, crucibles, &c.—4. *Brick clay* or *loam* is abundantly met with on the London clay, and is often found on an interposed bed of sand. Its appearance, texture, and composition vary greatly; and the colour depends on the proportion of oxide of iron contained in it.—5. *London clay.* This is an extensive deposit of bluish clay: although near the surface, it frequently has the usual clay colour. It extends over the greater part of Middlesex, a portion of Norfolk, and the whole of Essex and Suffolk. It is often found near the surface; but the lower beds are sometimes yellowish, white, or variegated. Organic remains are found in it.—6. *Plastic clay.* This skirts the London clay within the London chalk basin, and is also found in the Isle of Wight. This formation comprises a number of sand, clay, and pebble beds, alternating irregularly, and lying immediately on the chalk.

---

[1] *Traité des Arts Céramiques ou des Poteries considerées dans leur histoire, leur pratique, et leur theorie,* par Alexandre Brongniart, &c., &c., 2 vols. 8vo, with an Atlas of plates, Paris, 1844.

[2] Under the article BRICK will be found a notice of the various coarse clays employed.

The above varieties of clay are mixed with such substances as carbonate of lime, magnesia, protoxide of iron, manganese, finely-divided quartz, felspar, mica, organic matter, &c., which greatly modify its properties and applications. Pure clay is soft, more or less unctuous to the touch, white and opaque, and has a characteristic odour when breathed upon. It is a compound, or perhaps only a mixture, of the two earths, alumina and silica, with water. Silicate of alumina enters largely into the composition of many crystallized minerals, among which is felspar, so abundant an ingredient in granite, porphyry, and other ancient unstratified rocks. Under certain circumstances the felspar undergoes decomposition, and is converted into a soft friable mass. In certain districts of Devonshire and Cornwall the felspar of the white granite is often disintegrated to a great depth, and the rock becomes converted into a substance resembling soft mortar. This being collected, is thrown into a stream of running water, which washes off the argillaceous portions, and holds them suspended while the heavier quartz and mica subside. At the extremity of these streams the water is dammed up, forming *catch-pools*, where the pure clay sinks and forms a solid mass, which, when the water has been drawn off, is dug out in blocks, and placed on shelves called *linnees* to dry. It is next stove-dried, crushed, packed in casks, and sent to the potteries, under the name of *china clay*, or *kaolin.* It consists of 80 parts alumina and 20 silica; a proportion of undecomposed felspar, under the name of *china-stone*, is sometimes added to the ingredients for porcelain. In the year 1855 as much as 60,188 tons of china clay was shipped from Cornwall, and 19,961 of china-stone; while Devonshire shipped 20,000 tons of pipe-clay, and 1100 of china-clay. Of late years improved methods have been adopted for getting out the china clay in Cornwall. At the Lee Moor clay-works, for example, Mr Phillips, the managing director, has introduced the following arrangements:—The decomposed felspar is transferred directly from the quarry to the works, where it is thrown into hoppers, and passes into a trough under the action of a full stream of water, encountering on its way a series of knives and iron arms furnished with teeth, which thoroughly beat up the clay in its passage along the trough. Pure spring water is used in the operation, and great care is taken to exclude the surface drainage from the peat soil of Dartmoor. As the water leaves the trough it flows through sieves, which separate the coarser fragments of quartz, and the fluid, charged with clay and mica, passes on; the mica breaking up into thin scales, has a tendency to float, but being heavier than the suspended alumina, it gradually subsides under the regulation of the current, which is now not sufficiently rapid to carry on the mica, nor sufficiently sluggish to allow of the deposition of the clay. When at length the stream holds nothing but pure clay, it is allowed to flow into deep V-shaped channels, which terminate in large covered reservoirs, in which the clay is deposited. Warm-air pipes circulate beneath the reservoirs, so as to produce a temperature of about 90°. The fine clay soon subsides, so as to allow of the clear water above it being drawn off. The mineral *pegmatite* is also valuable, as containing all the ingredients for hard porcelain. It consists of felspar, kaolin, and a small proportion of prismatic quartz. The mineral must, however, be in the state of decomposition already referred to. The quartz gives whiteness and transparency to hard ware; but for soft porcelain bones are substituted. These melt into a kind of semi-transparent enamel, which imparts transparency to the ware. *Steatite*, or *soap-stone*, is also an ingredient in porcelain. The *statuary* porcelain known as *Parian* or *Carrara*, from its similarity to those beautiful marbles, owes its effect chiefly to the use of a soft felspar instead of Cornish stone; while its agreeable yellowish-white tint is due to the presence of a small portion of oxide of iron contained in the clays and the felspar.

The property possessed by clay of forming a perfectly plastic mass with water, and of being permanently fixed by heat, has led to its employment in the manufacture of bricks and vessels of various kinds, but it undergoes a large amount of contraction in drying and burning, to diminish which the clay is usually mixed with a considerable proportion of quartz-sand, or with the powder of previously-burnt clay. The quartz in pottery ware is in the form of flints; these are obtained from the chalk districts of Gravesend and Newhaven; they are white outside, but dark and clear within. Such flints should be selected the fracture of which is free from yellow or iron stains.

The preparation of the clay for such coarse articles as tiles consists first in *weathering*, or spreading it out to the action of the air, so that by absorbing water the particles may separate, and the clay work freely. It should be exposed to at least one night's frost, or to one day's sun, before a second layer is added to the first. The weather-clay is cast into pits, and left for some time covered with water to *mellow* or *ripen.* Before being used it is tempered by grinding in a pug-mill. This differs somewhat from that described under BRICK, it being tapered at both ends, and the hole is at the bottom instead of in front. If the clay be *foul*, or contain many stones, it is *slung*, or cut into lengths of about 2 feet with a *sling* or wire-knife, and then further divided into slices of three-quarters of an inch in thickness, during which operation the stones fall out, or are picked out. The clay goes once more through the pug-mill, and is then ready for the moulder. For chimney-pots and such articles the clay is slung once or twice, and pugged or ground two or three times.

---

[1] In the year 1855 there were exported from Poole in Dorsetshire 53,702 tons of Poole clay, and 582 tons were sent to London by railway.

Materials.

The clay for fine pottery undergoes a number of preparatory processes. Two or more kinds of clay being put together in proportions according to the judgment of the manufacturer, they are thrown into a trough with water and left for some hours. They are then well worked with a long blade of ash furnished with a cross-handle, named a *blunger*, until a smooth pulp is formed, a pint of which weighs 24 ounces, or, in the case of china clay, 26 ounces. The operation of *blunging*, as it is called, may be assisted by pugging the clay in an iron cylinder furnished with knives on the inside, and a moving vertical axis also containing knives, which by their joint action divide the clay, and by their position force it downwards, and out through an opening at the bottom. It is then removed to a vat, mixed with water, and blunged by means of cross-arms attached to a perpendicular shaft. In this operation stony particles sink to the bottom.

The flints having been heated in a kiln, and plunged in cold water to increase their brittleness, are crushed into fragments by means of stampers, and are next reduced to powder in a *flint-pan*. This is a circular vat 10 or 12 feet in diameter, the bottom of which consists of masonry of quartz or felspar. In the centre is a vertical axis, from which radiate four arms for moving the *runners:* these are masses of *chert*, a hard siliceous stone found near Bakewell in Derbyshire. The broken flints are thus ground with water, and in the course of some hours are reduced to powder, which forms with the water a creamy mixture. Felspar, broken porcelain, &c., is sometimes ground up in the same manner in smaller vats. The creamy mixture is transferred to another vat furnished with a vertical shaft and arms, and being diluted with water, the arms are set rotating, the effect of which is to keep the finer siliceous particles suspended, while the coarser ones sink to the bottom. The former are drawn off with the water, and the latter are sent back to the flint-pan. The water thus drawn off is received into a reservoir, in which the finer particles subside. The creamy mixture of flint and water is fit to mix with the clay when a wine pint of it weighs 32 ounces. The proportions, however, in which the clay and the flint are mingled vary greatly with the kind of ware intended to be made, and the experience of the manufacturer.

These proportions being determined, the ingredients are first mingled by being agitated together, after which the mixture is passed through sieves of fine hard-spun silk, arranged on different levels, so as to run through comparatively coarse into finer sieves, and produce a smooth, uniform mixture of *slip*, as it is called. To assist the easy passage of the mixture a jigging motion is given to the sieves. The water which has thus far served as a vehicle for the ingredients, is next got rid of by evaporation in the *slip-kiln*. This is a long brick trough, heated by flues underneath, and capable of raising the water to the boiling point. During the heating the slip is diligently stirred to prevent the heavier flint from subsiding, and also to prevent the flint and clay from forming a kind of mortar with the water. When bubbles of steam cease to form, the operation is at an end. In countries where fuel is not so abundant as in England, the water is got rid of by filtration, assisted by mechanical pressure, or by rarefying the air beneath the filter by atmospheric pressure.

When the stuff is of uniform texture and sufficiently hard, it is cut up into wedges which are dashed down upon each other, in order to get rid of vesicles and air-bubbles, which might afterwards form blisters in the ware. To obtain a fine grain the clay should be *wedged* at intervals during several months. It is stated that in China the stuff is prepared many years in advance. The French missionaries were informed that it was customary to prepare the stuff for a hundred years (*pour cent années*), whence arose a fanciful derivation of the word porcelain. However this may be, there is no doubt that newly-made stuff produces bad ware, and that *ageing* greatly improves it. During the last-named process a kind of fermentation sets in, carbonic acid and sulphide of hydrogen are liberated, and the mass improves in texture and colour. These gases are doubtless formed at the expense of the carbonaceous and organic impurities of the clay or of the water, whence the improvement in colour; while the disengagement of the gas accounts for the improvement in texture. The next process is *slapping*, in which the workman takes up a mass of the paste and dashes it down with violence, then dividing the mass with a wire, he dashes the top portion on the lower; this is done many times, care being taken to preserve the *grain*,—that is, to slap the layers parallel to each other, and not obliquely, otherwise the paste would be liable to fall apart during the firing.

Manufacture.

SECT. III.—THE MANUFACTURE.

There are three processes by which fictile articles are shaped,—namely, *throwing*, *pressing*, and *casting*. Of these, throwing is the most common, and by far the most ancient. It is performed by means of the potter's wheel or lathe, which is a disc of wood fastened to the top of a vertical spindle, and made to rotate by being connected by means of a strap with a multiplying wheel driven by an attendant. The paste, as it is received from the slapper, is of the consistence of dough. The thrower's attendant cuts it up into portions, weighs each, according to the quantity required for the intended article, and rolls each portion up into a ball. The thrower, seated before his lathe, dashes one of the balls down upon the rotating board, and with the fingers, which are frequently dipped in water, raises the lump into a conical form, presses down the mass to get rid of air-bubbles, and with one hand, or finger and thumb, in the mass, gives shape to the intended article; he is also furnished with a piece of horn or porcelain called a *rib*, the edge of which accurately represents the curve of the vessel. With this he smooths the inner surface, and gives it shape. During this operation the assistant turns the wheel with varying rates of speed, so that the centrifugal force may act differently in different conditions of the growing vessel. The thrower is furnished with a rude kind of fixed gauge, consisting of an upright stick, from which projects a horizontal rod at such a height above the whirling table as to enable the thrower to make all the articles of one kind very nearly of the same size. When one article is finished, it is removed by passing a wire beneath it, and is set aside in an airy or a warm room until sufficiently consolidated for the next operation, which is *turning*. As it would not be possible for the thrower to produce articles sufficiently thin, they are reduced in size by being put on the chuck of a lathe, and turned to shape by means of cutting tools, the material flying off in long, broad shavings just as if it were wood. When it has thus been properly thinned and brought to shape, the vessel is smoothed and solidified by the pressure of a broad tool upon its surface. Handles, spouts, &c., are formed separately, and are attached to the articles by means of slips. Flowers, leaves, &c., are formed partly in moulds and partly by hand, and are stuck on separately. The article is lastly trimmed with a knife, and cleaned with a damp sponge, and is ready for the kiln.

By the process of pressing, such articles as plates, dishes, saucers, &c., are formed. The exact pattern, say of a plate, having been determined by means of a model, a number of plaster casts are taken, one of which the plate-maker places on a whirling table, bats out a sufficient quantity of paste by means of a plaster mallet, and when sufficiently extended, places it on the mould, much in the same way as a housewife would cover a pie with paste. The table is then set whirling, and a profile or shape in earthenware being brought down upon the paste, gives the required form to the bottom of the intended plate. When the plate-maker is satisfied with his work, the mould, with the plate in its *green* state, as it is called, upon it, is conveyed by a boy to a warm room, and he brings back an empty mould, which has been drying, for another plate. In about two hours the plate is sufficiently dry to be removed from the mould, but the mould itself is left to dry before it is used again. One man and two boys can produce from sixty to seventy dozen of common plates in a day of ten hours, the same mould being used some five or six times during the day.

The above operation is called *flat-ware pressing.* Deep vessels are formed by what is called *hollow-ware pressing* or *squeezing*, for which purpose the mould consists of several parts, which fit accurately together by means of projecting pins and cavities. The clay having been batted out, the several parts of the mould carefully lined with it, and the points of junction well worked and wetted with slip, are brought together and secured by a cord, when the joints are further well worked and pressed, thin rolls of clay being sometimes inserted, and the whole worked and smoothed with moist leather and a cow's lip. The interior is then washed with a sponge, set aside for a time, and, when somewhat solidified, is worked or polished with a flexible plate of horn; it is next put into a warm room, and when the plaster has absorbed sufficient moisture, the article is removed from the mould and *fettled* or trimmed with proper tools to get rid of seam marks. The outside is also cleaned with a moist sponge, and the handles, &c., having been added, and the horn again used, it is set aside for baking. For elaborate works, models are first formed by experienced artists in clay, and the moulds for the separate parts may be numerous. Works of a comparatively simple character are formed by the united agency of throwing and moulding.

By the third process, called *casting*, such delicate articles as egg-shell china are formed. The paste having been reduced to a creamy state, is poured into a plaster-mould, which, absorbing water from that portion of the paste which comes in contact with it, fixes it, so as to allow the remaining fluid portion to be poured off. A very thin coating of paste is thus left attached to the mould; when this is sufficiently dry, the mould is again filled for a short time with the creamy mixture, when a second thin deposit is formed upon the first. The mould having been dried in a warm room, the cast is taken out, examined, and touched upon by the modeller. Busts and statuettes are also formed in this way; but as they shrink as much as one-fourth during the firing, considerable dexterity is required to preserve their shape. The lace which is sometimes seen on these figures is real lace, dipped into slip, when the heat of the kiln destroys the thread, and solidifies the paste, which takes its place.

Encaustic tiles are made by what may be called a fourth process, namely, *veneering.* They consist, as we saw them made at the works of Mr Minton (to whom this branch, as well as other branches of the ceramic art is so deeply indebted), of a body of red clay, faced with a finer clay for the pattern, and strengthened at the bottom with another clay, the junction of these layers apparently preventing warping. After the usual preparatory processes, the red clay is slapped into the form of a quadrangular block, from which the tile-maker cuts off a slab with a wire, and upon this the facing of finer clay, coloured to the required tint, is batted out and slapped down. The bottom facing is added in a similar manner. The tile is then put into a box-press, when a plaster of Paris slab, with the pattern in relief, is brought down on the face of the tile, and impresses in the soft tinted clay the design, the hollow being afterwards filled up with clay of another colour. At the same time, the maker's name is stamped at the back, together with a few holes to make the mortar adhere. The coloured clay, in a creamy state, is next poured over the face of the tile, so as completely to conceal it, and when, in the course of twenty-four hours, this coloured slip has become hard, the superfluous clay is scraped away, the coloured clay being left only in the hollows formed by the pattern-mould. The tile having been finished off with a knife, and defects corrected, is kept during a week in a warm room, called the *green-house*, and the drying is finished in a warmer room, called the *hot-house*, preparatory to firing.

The various articles of pottery, stone-ware, or porcelain having, by one or other of the processes named, been perfected as to form, and handles and other appendages, and solid ornaments added, are now in what is called the *green* state. The next process is to fix them, and deprive them of their plastic nature by the action of heat. The *potter's kiln* consists of a massive domed cylinder of brick-work, bound with iron, and protected from the weather by an outer conical hood or casing. The dome contains openings for the exit of the smoke, which escapes into the air through a chimney in the hood. Heat is supplied by means of six or eight fire-places fixed round the cylinder, with proper circulating flues and dampers for regulating the draught. During the firing, the ware (unless of the commonest kind) is not exposed to the direct action of the fire, but is carefully packed in strong vessels, shaped very much like band-boxes; they are made of Staffordshire marl, and are called *seggars.* The pieces must be packed in the seggars in such a way as to economize space, and yet give them the full benefit of the heat; at the same time, they must be arranged according to their size and solidity, so that small and delicate articles may not vitrify under too strong a heat, and large ones have heat enough. Some articles admit of being placed in contact, so as to support each other and prevent distortion. When the pieces are large or complicated in shape, they may require special supports to prevent warping; these supports are of fire-clay, and nicely fit the parts supported. Articles in porcelain are sometimes separated during the firing by means of sand or powdered flint; but the contrivances of this kind are numerous. When the seggars are filled, they are conveyed to the furnace, and piled up so that the flat bottom of one seggar may form a cover to the open mouth of the seggar immediately beneath it, the surfaces being separated by a ring of soft clay, which forms a tight joint. As many as 30,000 pieces of ware may be included in one baking. When the seggars are properly arranged in piles, or *bungs*, as they are called, and steadied by means of short struts, the door of the kiln is closed with brick-work, the fires are lighted, usually in the evening, and are urged during the whole of the night, so that flame may be seen issuing from the chimney. Early in the morning the man draws his first *watch.* Watches or trial-pieces are small rings of fire-clay, which vary in colour with the temperature; a number of these are placed within the kiln in such positions that the man can withdraw them at pleasure by inserting a long iron rod through holes in the side of the kiln. The heat is regulated according to the aspect of these watches, and when, after thirty or forty hours, the firing appears to have been satisfactory, no more fuel is added, the fires are left to go out, and the kiln gradually cools during the next twenty or thirty hours. As much as fourteen tons of coal may be consumed in one firing. There can be no doubt that a very large proportion of this fuel is wastefully expended: our present abundant native store of coal leads to much extravagance in our various factories; and it has been suggested by M. Arnaux, a competent authority, to fire the ware by means of gas, which, he thinks, can be done with an ease and precision unattainable by the present system.

When the ware is removed from the kiln, its characters are found to have undergone a remarkable change. Instead of a soft, dull, friable or plastic material, we have a hard, brittle, resonant, light-coloured, porous body. In this

Manufacture.

state it is called *biscuit*, from its resemblance to well-baked ship bread. Wine-coolers and similar porous articles, when brought to this state, are finished; but most articles, especially of earthenware, must be covered with some kind of vitreous glaze, to remove their porosity and liability to tarnish, and to render them fit for use. If coloured ornaments have to be added, these are first put upon the biscuit, and the glaze, in the form of a white powder, is then made to cover the whole article, which, being passed a second time through the fire, the powder melts into a glass, which forms the ordinary surface of common wares. The firing is a costly process, from the great expenditure of time and fuel, and this second firing still further increases the cost of the ware. It thus became a great improvement when Wedgwood was able so to compound the ingredients of his ware that partial vitrification took place at the first firing, thereby depriving the ware of its porous character, and rendering a second firing unnecessary. So also, in the commonest kind of stone-ware, such as is made at the Lambeth potteries, the glazing is, by an ingenious device, effected simultaneously with the baking. When the ware has attained a very high temperature in the kiln, a quantity of moist salt (chloride of sodium) is thrown in; the salt is volatilized and decomposed in the presence of moisture, and by contact with the heated surfaces of the clay, hydrochloric acid is disengaged, and the ware becomes covered with silicate of soda, which, combining with the silicate of alumina of the ware, forms a fusible double alkaline silicate or glaze on the surface.

The object of the glaze being to render the article impermeable by water, attempts have been made to accomplish that end in various ways. Certain rude nations render their wares impermeable by rubbing them while hot with tallow, which, becoming partially decomposed, fills up the pores, and imparts a black colour. Even the vases of the artistic Etruscans and Greeks have not a vitreous but a carbonaceous glaze, which wears off in the handling. The wine and oil jars of Spain and Italy are made watertight by the ancient method of rubbing them over with wax. The most common description of glaze is, as its name *glaze* or *glass* implies, vitreous. It is of two kinds, *transparent* and *opaque*. When the ware is of good colour, and the ornaments are impressed upon it, the glaze may be transparent; but where the clay, otherwise good in quality, is bad in colour, an opaque glaze, or *enamel*, as it is then called, is used. In some cases, articles made of a good clay, of a bad colour, may, before firing, be dipped into a slip of white clay, and being thus veneered, admit of taking a transparent glaze. Glazes coloured by means of a metallic oxide are also sometimes used. The glaze should not have too strong an affinity for the paste, or during the second firing it may be absorbed into the ware instead of remaining at the surface, to which it should adhere firmly, and expand and contract equally with the ware, so as not to be liable to craze or crack. Numerous substances are employed in the composition of glaze. For very hard ware, in which the point of fusion is high, the felspars and certain volcanic scoriæ are used; in other cases, common salt, potash, boracic acid, phosphate of lime, and sulphate of baryta, are the ingredients. Another class of glazes contains earthy and metallic substances, mixed or fritted into a glass; such are silica and lead, or enamels of silica, tin, and lead. Some glazes contain metallic oxides, such as those of manganese, lead, and copper. Metallic and earthy substances, if not previously fritted, form a glaze with the silica of the paste in the gloss oven. Such glazes, however, are commonly soft, and liable to be acted on by acid and fatty substances; so that lead glazes should be avoided for articles intended to receive food. In such cases, borax may be advantageously substituted for lead. A pure white paste is improved by a transparent glaze, but if of bad colour, it may be dipped into opaque glazes even before the first firing. Glazes are made opaque by means of oxide of tin; colour is given by the oxides of manganese, copper, and iron; while, by introducing these, together with the oxides of cobalt and of chromium, into opaque and transparent glazes, an agreeable variety is produced. Pegmatite forms a good glaze for hard porcelain; but for soft porcelain a glass is fritted and mixed with oxide of lead, or with earthy substances.

Ornamentation.

In applying the glaze to the biscuit, it is reduced to a fine powder, and mixed with water. When the biscuit is plunged into this mixture, the porous material immediately absorbs a quantity of the water, and leaves the powder equally distributed over its surface. When articles are glazed and fired at one operation, the ware in its green state is not absorbent, so that the glazing has to be put on with a brush. For articles which are glazed on the inside only, such as pipkins, the glaze is made creamy with water, and poured into the vessel and then out again, a sufficient quantity adhering to the surface by this means. Custom requires that jars shall have a portion of their surface of a deeper brown than the natural colour of the material; they are therefore dipped to a certain height in a mixture of red ochre and clay slip. The glazing is completed during the firing by means of common salt, as already noticed.

The pieces having been covered with white powder, are arranged in seggars to protect them from the direct action of the fire in the gloss oven. They are separated from each other by means of supports, which present the smallest possible surface of contact. These supports, known as *cockspurs, triangles, stilts*, &c., have points projecting from them above and below, which serve to separate, while they support, the articles as they are piled up in the seggars. The seggars are piled up in the glaze-kiln in the same manner as in the biscuit-kiln, and the temperature is raised to a point sufficient to fuse the glaze into a transparent glass, and to unite it perfectly with the surfaces of the ware. To enable the workmen to determine when the proper temperature has been reached, watches, or rings of clay, covered with glaze, are placed in the oven, and drawn out from time to time.

SECTION IV.—THE ORNAMENTATION.

The love of ornament, which forms part of that higher sense of beauty common to our nature, requires the addition of some kind of adornment to articles in common use. The rude pottery of savage nations is relieved in this way, and often with considerable taste. It may admit of question whether our own taste is equally correct in the elaborate decorations which we bestow upon articles intended for everyday use. Plates of Sèvres porcelain, richly decorated with landscapes, or portraits of distinguished individuals, may have a high artistic value, but are certainly not adapted to be placed before the company at a dinner table. A dessert or dinner plate is not in itself remarkable for beauty of form; but its effect is absolutely hideous when it is made to take a prominent part in decoration. In the palace at Fontainebleau we were introduced to a room, the walls of which were decorated with plates of Sèvres china, arranged in horizontal lines. In such an example, the costliness of the material and the skill of the artists were rendered simply ridiculous. So also the rich blue and gold of a tea-service have too heavy an effect, when the feeling of grace and lightness ought to be inspired. The leading idea in ceramic ware should be that of purity. The white colour would sufficiently suggest this if it were not concealed by ornament, just as that pure material glass, when not spoilt by the glass-cutter, reveals the unsullied transparency of the water or of the wine contained in it. The artist may exercise his taste in producing beauty of form, but the ornamentation of that form should be of the simplest character, only just calculated to relieve the beauty of the material. Our limited space will not allow us to enlarge on this subject, so that we at once proceed to a brief notice of the mechanical and chemical means by which ornaments are applied to pottery and porcelain.

When common ware is to be ornamented with a pattern, it is put on before the glazing. The blue pattern of an ordinary plate is printed on the biscuit with an ink composed of boiled linseed oil, resin, tar, and oil of amber, coloured by means of a mixture of oxide of cobalt, ground flint, and sulphate of baryta (fritted and ground), and blended with a flux of ground flint and thick glass powder, which serves to fix the colour. The ink is made fluid by spreading it on a hot iron plate. It is taken up by means of a leathern dubber, and transferred to engraved copper-plates, also heated, and the superfluous colour is scraped off with a palette-knife, and the surface of the plate is cleaned with a dossil. A sheet of yellow unsized paper is next dipped into soapy water, and placed on the copper-plate, which is thus passed through a cylinder press. The pattern is thus transferred to the paper, which is taken by a girl called the *cutter*, who cuts away the unprinted portions, and leaves the pattern in separate parts. These are taken by a woman called the *transferrer*, who places each portion with its printed side next the biscuit, and rubs it with a flannel rubber, until the ink is properly absorbed. The pattern-papers are subsequently removed by placing the biscuit in water, and gently washing it with a brush. The biscuit is next dried in an oven, and is then ready for glazing; the heat of the gloss oven vitrifies the glaze, and allows the pattern to be seen through it. Instead of paper, a flexible sheet of glue, called a *paper* or *bat*, is in some cases used for transferring the design. The impression is taken in oil from the engraved plate, and after it has been transferred to the biscuit, the required colour is dusted over it in a dry state. The sheet of glue can be cleaned with a sponge, and can be used over and over again.

When the pattern is required to produce high artistic effects of form and colour, the work is performed by hand with a camel-hair pencil. The colours consist of metallic oxides ground up with such vitrifiable substances as glass, nitre, and borax, oil of turpentine or of lavender being the usual vehicle. The greatest difficulty which the artist has to contend with arises from the fact, that the colours are for the most part dingy and unpleasing, and give no idea to an inexperienced eye of the intended effect.[1] It is not until the heat of the furnace has driven off the oil, and chemically combined the ingredients of the colours, that the effect can be judged of. The artist has thus to work, as it were, in the dark: he is not cheered with the idea of progress, as in ordinary oil-painting, where the work seems to grow into life, and to develop new details of beauty at every touch. Even after the first firing, it by no means follows that success has been attained. The work may have to be re-touched, and again passed through the fire, or it may be injured by one or other of the numerous accidents to which a work is liable which has to pass through the fire.

The colours used are formed by the combination of certain metallic oxides and salts with certain fluxes, by means of heat, which enables them to fuse into coloured glasses. The oxides are usually those of chromium, of iron, of uranium, of manganese, of zinc, of cobalt, of antimony, of copper, of tin, and of iridium. The salts and other bodies used for imparting colour are the chromates of iron, of baryta, and of lead, the chloride of silver, the purple precipitate of cassius, burnt umber and burnt sienna, red and yellow ochres, &c. Some of these develop their colours under the influence of the highest temperature of the porcelain furnace, and are hence called by the French chemists *couleurs de grand feu*; others, and by far the larger number, are termed *muffle-colours*, inasmuch as they become developed under the more moderate heat of the muffle, which is a kind of seggar, in which the painted ware is inclosed, to protect it from the fuel. The first class of colours is limited to the blue produced by oxide of cobalt, the green of oxide of chromium, the brown produced by iron, manganese, and chromate of iron, the yellows from oxide of titanium, and the uranium blacks. Those colours form the grounds of hard porcelain, and as the heat employed in firing it is capable of fusing felspar, that substance is used as the flux. For an indigo blue, four parts oxide of cobalt and seven parts felspar, or for a pale blue, one part oxide of cobalt and thirty parts felspar, are well pounded, mixed by repeated siftings, and vitrified in a crucible in the porcelain furnace. The resulting glass is reduced to powder, ground up with a volatile oil, and applied to the surface of the biscuit, which, being again raised to the high temperature of the porcelain furnace, the colour fuses, and becomes incorporated with the substance of the ware. The high temperature required for cobalt has, however, this inconvenience, that a portion of it becomes volatile, so as to affect objects placed near it. In this way a white vase in the same furnace may derive a blue tint from the vapour of the cobalt. This colour is also uncertain in its results: it sometimes leaves white uncoloured patches, or forms a dull granular surface. Oxide of chromium may be employed without a flux to give a green colour to hard porcelain; but as it does not, under such circumstances, penetrate the ware, it is liable to scale off. A bluish-green is produced from three parts oxide of cobalt, one part oxide of chromium, and one-tenth of felspar, without fritting. Mixtures of the oxides of iron, manganese, and cobalt, produce a fine black, and by omitting the cobalt, various shades of brown.

The muffle colours are too numerous to be stated here; they are fired at a temperature equal to about the fusing point of silver. Many of them would become more brilliant and solid under a greater heat, but this would be injurious to those colours which are obtained from the purple precipitate of cassius,[2] on which the artist relies for some of his finest effects, such as fine purple, violet, and carmine tints.

In preparing metallic oxides and their fluxes sound chemical knowledge is required, otherwise the results cannot be depended on. The chemist relies on the stability of nature, as revealed to him by his science; he reduces his materials to a state of chemical purity, and compounds them according to the law of definite proportions. In order, for example, that the yellow colour imparted by chromate of lead shall be identical at all times, the compound must obviously consist of nothing but equal equivalents of oxide of lead and chromic acid. In such case, if the pigment be applied at different times under the same circumstances, it will produce precisely similar results; but if either of the proximate elements of the salt be impure, no reliance can be placed on the compound. Different specimens will produce different results, although the same mode of applying them be always observed. In some cases, however, not even the chemical purity of the ingredients will insure harmonious results. The physical condition of one of the ingredients may be of importance, as in the case of oxide of zinc, an ingredient in some of the enamel greens, yellows, yellow-browns, and blues. If the oxide be lumpy, granular, dense, and friable, it will produce a dull pigment, although chemically pure, while a light flocculent impalpable oxide, chemically identical with the former, will give satisfactory results. It is further necessary that solutions of a metal be made at the same temperature, that the acids which dissolve it be of the same strength, that the precipitate be neither more nor less rapid on one occasion than on another. Such conditions as these require to be carefully studied and noted, as, indeed, has been done in the laboratory at Sèvres, where minute records are kept of the processes required for compounding the colours.

---

[1] Attempts have been made to construct a palette of enamel colours which do not change colour in the firing, but only change from a dullness to a creaminess of texture. A case of this kind is mentioned by Brongniart, but the success attained by the inventor, M. Dihl, was only partial; since the rose tints, purple, and violet, produced by the precipitate of cassius, which cannot be prevented from changing under the action of heat, were omitted. Besides this, the action of the surface, and the different kind of glaze upon the colours were not taken into account.

[2] This pigment is formed by adding a solution of gold in *aqua regia* to one of chloride of tin.

But even when such conditions as the above are known and observed, there are others so slight as scarcely to be appreciable, but which, nevertheless, have an influence on the colour. With certain delicate pigments, the porphyrization or grinding with water or oil a little more or less, the difference of touch of different artists in laying on the same pigment, will produce differences in tone, although all the other conditions be strictly observed.

Dumas defines the process of painting on hard porcelain to be the art of soldering by heat to a layer of the glaze a layer of fusible colour, the dilatation of which shall be the same as that of the glaze and the body of the ware. The function of the flux is to envelop the colour and attach it to the glaze. In most cases it has no action on the colour, but is simply mechanically mixed with it: the flux, however, must mix with the glaze. That muffle colours do not penetrate the porcelain, may be proved by boiling in nitric acid a piece of painted ware after it has been fired, when the colours will disappear. As the flux is only a mechanical vehicle for the colour, it must vary with the colour; but the necessity for mixing or blending colours greatly limits the range of fluxes. A common flux is the silicate of lead, or a mixture of this with borax. Now the borax cannot be replaced by the fixed alkalies, on account of the readiness with which soda or potash becomes displaced in order to form other compounds. They have also a tendency to make the colours scale off. The mode of using the fluxes varies with the colour: in some cases it may be ground up in proper proportions with the colour; in others it must be previously fritted with the colour. The first mode is adopted when the colouring oxide is readily altered by heat; but when the oxide requires a high temperature to bring out its characteristic colour, the second method is adopted.

Not the least among the difficulties of enamel-painting is the high temperature required for the vitrification of the colours. The lowest heat of the muffle is about 1100° Fahrenheit; while some oxides do not develop their colour below 1850°. In the regulation of the furnace, the most successful method is to begin with a low heat, and urge it rapidly up to its maximum, and as rapidly to lower the heat. A moderate heat, long continued, may produce devitrification,—that is, the elements of the flux may separate, and combine again in a different manner, so as to produce an opaque substance known as *Réaumur's porcelain*. There is danger in the opposite extreme; for if the temperature be carried too high, some of the more delicate tints, such as the roses and the grays, become faint or vanish altogether, while the hardier greens, blues, and blacks remain. On the other hand, if the maximum temperature be not quite reached, the colours do not present that peculiar creaminess and glossiness which is characteristic of the art. The temperature is regulated by means of watches, consisting of small slabs of porcelain smeared with some trial colour, usually the carmine produced by the purple precipitate of cassius. This forms a useful exponent of all the other pigments: it varies greatly in tint according to the temperature; so that, by arranging a scale of temperatures corresponding with a scale of tints, a tolerably accurate thermoscope may be formed. Brongniart invented a pyrometer for estimating the temperature of the interior of the muffle; its action depends on the expansion of a bar of fine silver, nearly eight inches long, introduced into the muffle, and connected with a graduated scale on the outside.

The kind of fuel used for heating the muffle has an influence on the colours; for although the muffle may consist of an iron box heated only on the outside, it is almost impossible to prevent some of the products of combustion from entering it. The smoke of ordinary coal is especially injurious to the colours, from the presence of sulphurous acid, which is also given off from coke. Wood has its pyroligneous acids, and even charcoal gives off carbonic acid. The presence of an acid is so injurious in the muffle, that the reds produced from green vitriol, before being used, must be thoroughly washed, to get rid of the last traces of acid. It is also stated that a muffle in which cuperose has been calcined, cannot be used for the firing of colours.

There is also a difficulty connected with the use of oxide of lead, which is required in the preparation of certain colours, but is injurious to the development of some others. Again, the fixed alkalies used in the composition of the glaze may re-act on the colouring oxides, especially at the maximum temperature. In this way, the oxide of chrome will produce yellow instead of green. The oxide of lead, the potash, and the soda, may not only act injuriously by contact, but, by becoming volatilized, they may injure every colour in the muffle. Moreover, the oxide of tin, used in certain glazes, may impart its own opacity to the colours. It is also a curious fact, that different kinds of kaolin are not all equally favourable to the development of the colours put upon the ware; and we are informed that the kaolin of Ebreuil will not allow of the development of any colour derived from gold.

In close relationship with painting on porcelain stand the sister arts of enamel-painting[1] and painting on glass. It does not belong to our subject to enter into any details respecting them, but we must notice one or two more processes connected with the ornamentation of porcelain.

The metals used for imparting colour, hitherto referred to, have been in the form of oxides, &c., and used with a flux. The gold used in gilding porcelain is first dissolved in *aqua regia;* the acid is driven off by heat, when the gold remains in a state of minute division. It may also be precipitated by means of sulphate of iron. In this minutely-divided state it is mixed with one-twelfth of its weight of oxide of bismuth, together with a small quantity of borax and gum-water, and applied to the ware by means of a hair pencil. If the article is to have only a circular line of gold, it is placed upon a small table or whirler, and the artist, steadying his hand on a rest, applies the pencil to the article, while with the other hand he causes the table slowly to revolve. The gold ornaments come out of the fire with a wretched dingy hue; but the lustre of the gold is brought out by burnishing with agate and blood-stone, and the gilding is cleaned with vinegar or white lead.

Other metals which, like gold, do not become readily oxidized, are applied to stone-ware, and form what are called *metallic lustres.* The silver-white hue known as *silver-lustre* is obtained from platinum by dissolving the metal in *aqua regia*, and pouring the saturated solution into boiling water. This is poured into a warm solution of sal ammoniac, when the metal forms a yellow precipitate, which, after having been washed and dried, is applied to the ware by means of a flat brush, and the article is then passed through the muffle-kiln. A sufficient body of lustre may be obtained by repeating the operation; and should the articles come out of the muffle black, friction with cotton will give the required lustre. A platinum lustre resembling that of polished steel is obtained by dropping a solution of equal parts of tar and sulphur in hot linseed oil, known as *spirit of tar*, into the acid solution of platinum. The mixture is spread over the ware, and passed through the muffle as before. *Gold lustre* is obtained by precipitating a solution of gold in *aqua regia* by means of ammonia: it has fulminating properties, and must therefore be mixed with the essential oil of turpentine while moist, and in this state applied to the ware. After the firing, the lustre will be brought out by friction with linen. The *lustre cantharide* of the French, which is remarkable for its iridescence, is obtained from chloride of silver, partly decomposed by means of combustible vapours. For this purpose a mixture of a lead glass, oxide of bismuth, and chloride of silver, is applied to the ware. This is then raised to a red heat in the muffle, when a fuliginous smoke is introduced, which effects the partial decomposition required. An *iron lustre* is obtained by mixing a solution of iron or steel in hydrochloric acid with spirit of tar, and applying it to the ware. Silver and platinum lustres are usually laid upon a white ground; gold and copper lustres have the best effect on coloured grounds. The paste body for lustrous ware is usually made for the purpose, of four parts clay, four of flint, four of kaolin, and six of felspar. Its colour is brown, but it is coated with a lead glaze composed of sixty parts litharge, thirty-six of felspar, and fifteen of flint.

---

[1] The writer has some observations on vitrifiable colours in three articles entitled "On Enamel-Painting," contained in the *Art-Journal* for 1857.

In the Great Exhibition of 1851, some cheap articles, producing a novel and agreeable effect, were shown in the French department. They consisted of what is called *émail ombrant*, and the process of their manufacture is to stamp the designs in the body of the ware, and to flood them with coloured transparent glazes. In this way a plane surface is produced, in which the hollows of the stamped design appear as shadows of various depths, while the parts in highest relief, coming nearest the surface of the glaze, have the effect of lights in the picture.

In the volume containing the *Jury Reports* of the Great Exhibition is a "Supplementary Report on Design," by Mr Redgrave, in which, among a number of judicious remarks on the ornamentation of ceramic wares, he gives his opinion as to the present artistic position of the factories of Europe. He places Sèvres at the head of the list, and refers to the wares exhibited as illustrating the wisdom of a judicious application of the *best* art to manufactures. "Here we find the taste of the first artists, assisted by the science of able chemists, and under a judicious direction, united to the most skilful workmanship and manufacture; and the result is, that the fabrication of porcelain is carried to the highest state of excellence." Most of the works exhibited must be classed as *ornaments*, such as vases, tazzas, &c. The forms were pure, and rarely interfered with by reliefs. The modelling and the painting were of rare excellence, and it was deemed to be scarcely possible to produce such works without exercising an important influence on the other manufactures of the country, and a general cultivation of the public taste. The exhibition of Dresden ware was not remarkable for purity of form or appropriateness of decoration. "The surface is often covered with purely imitative flowers in high relief, glowing and brilliant as the tints of nature, yet looking gaudy as ornament, and, from their filmy projections, liable to injury with every touch. . . . . Even the May-flower pattern, a production of great beauty, on the principle of a diaper of form and colour, from its minute hollows, is quite incapable of being cleansed; and from the thickness which it adds to the form, contradicts the true effect of porcelain, which should unite lightness with capacity." Where these works were not purely imitative, they partook of the extravagant prettiness of style of Louis Quinze, when the Dresden manufacture was enjoying its most prosperous days.

The works both of Sèvres and Meissen have had considerable effect on the progress of our own manufactures; but while on the Continent decoration has been, for more than a century, cultivated as a branch of the fine arts, our painters on china have been mere copyists, who, until the establishment of schools of design, had no opportunity of obtaining artistic education. Our modellers have hitherto been deficient in knowledge of the human figure, but an improvement in both respects has for some time set in, and will doubtless be fostered by the many facilities of the day.

The royal manufactories of Berlin and Bavaria, in their specimens forwarded to the Great Exhibition, seem to have followed classic models, and although free from some of the faults of Dresden, they committed the great fault of overloading ornament. (C. T.)

POTTINGER, Sir Henry, was descended from an English family which had been long settled in Ireland, and was born at Mount Pottinger, in the county of Down, in 1789. His rise in life was slow but steady. Having gone out to India in 1804 as a cadet in the Bombay service, he recommended himself for promotion by his energy and sagacity in practical affairs. He was employed for more than seven years as judge and collector at Ahmednugger in the Deccan. The following fifteen years were passed in the post of political resident at Cutch and Scinde. At length in 1840 he returned to England, dignified with a baronetage, and possessing a high reputation. Sir Henry Pottinger soon proved himself worthy of the high consideration in which he was held. Despatched to China in 1841 as ambassador extraordinary and minister plenipotentiary to adjust the differences relating to the opium trade, he set himself to this arduous task with vigour and address. On his arrival at the scene of war, he took the most decisive measures to drive the Chinese to an honourable and lasting peace. Nor after he had succeeded in 1842 in bringing the enemy to terms, did he lay down his commission until he had taken strong precautions to prevent future abuses. The eminent services of Sir Henry Pottinger were rewarded with a series of honours and appointments, which continued over the rest of his life. In 1843 he was promoted to the office of governor and commander-in-chief of the island of Hong Kong. On his return to England in the following year the office of a privy councillor and a pension of L.1500 were conferred upon him. He then held the governorship of the Cape of Good Hope from 1846 to 1847. His last appointment was that of governor and commander-in-chief of Madras, an office which he held till 1854. The death of Pottinger took place at Malta in March 1856.

POTTSVILLE, a town of the United States of North America, Pennsylvania, occupies a picturesque situation on the Schuylkill, 93 miles N.W. of Philadelphia. It stands on uneven ground in a very narrow valley, and is in general well built, chiefly of brick. The chief public edifices are the court-house, town-hall, jail, and numerous churches. There are also an academy, several other schools, and five or six newspaper offices. Among the manufactories of the place are iron-works, machine-shops, woollen and carpet factories, tanneries, and breweries. The surrounding country, though barren and rugged, is very rich in minerals, especially in coal; and is densely inhabited, containing numerous towns and villages. The coal trade in Pottsville is extensive, and rapidly increasing. The coal is brought here from the various mines in the vicinity, and conveyed by railway or river to Philadelphia and other places. The town has entirely risen up since 1825. Pop. (1850) 7515; (1853) about 10,000.

POUGHKEEPSIE, a town of the United States of North America, in the state of New York, on a plain on the left bank of the Hudson, 75 miles N. of New York, and 70 S. of Albany. It is regularly built, and contains numerous churches belonging to Presbyterians, Episcopalians, Methodists, Baptists, Roman Catholics, and other denominations; a collegiate school, occupying a large and handsome building, on an eminence; an academy; several girls' schools; and three or four newspaper offices. The principal manufactures of the town are machinery, farm implements, guns, ironware, leather, carpets, cotton goods, flour, and beer. Here is the largest brewery in the United States, producing annually 36,000 barrels of ale; and many of the other establishments are among the most extensive in the country. Many steamers and sailing-vessels are owned at Poughkeepsie. Pop. (1850) 13,944.

POULTRY. See AGRICULTURE.

POUND, applied to a measure of weight, of which the *pound avoirdupois*, weighing 7000 grains troy, and the *pound* troy, weighing 5760 grains, are used in England. The former is divided into 16 ounces and the latter into 12 ounces. (See WEIGHTS AND MEASURES.)

POUND is also a denomination of money, being equal in value to 20 shillings or 240 pence. Anciently 240 pence were equivalent to a *pound weight* of silver. Hence the origin of the term.

POUNDAGE, a subsidy of twelve pence in the pound, granted to the crown on all goods and merchandises exported or imported; and if by aliens, one penny more.

POURCAIN, ST, a town of France, in the department of Allier, in a beautiful valley at the confluence of the Limon and Sioule, 18 miles S. of Moulins. There are here a parish church of the tenth century, an hospital, a theatre, and several flour-mills. Some trade is carried on in the excellent wines raised in the vicinity, as well as in cattle, poultry, and fish. Pop. 4636.

POUSSIN, GASPAR, whose real name was *Dughet*, was born at Rome in 1613. His father, who was French, had settled in Rome sometime before his birth, and Nicolas Poussin having married his sister, he acquired the appellation by which he is ordinarily known. He studied under his brother-in-law, by whose advice he adopted landscape-painting, in which he attained to a great celebrity. His passion for grace and beauty was extreme: he selected in all his pieces the most enchanting views of nature, and "in the opinion of many," says Lanzi, "there is not a greater name among landscape-painters." He is said to have acquired singular facility; and, like Rosa, could finish a landscape and decorate it with figures in a day. He painted all sorts of landscapes, and in everything he did, he displays elegance and erudition. Nicholas Poussin occasionally embellished Gaspar's pictures with figures representative of some portion of history or of fable. Gaspar has left behind him a few masterly etchings, consisting of four circular landscapes and a set of four landscapes lengthways. He died at Rome in 1675. A considerable number of pieces from this excellent artist's pencil are to be seen in the National Gallery, London.

POUSSIN, *Nicolas*, a celebrated painter, called the "Raphael of France," was born at Andely in Normandy, on July 19, 1594. He was sprung from a noble but very poor family, who had been much reduced by the part they had taken in the civil wars. Having obtained his father's consent to become a painter, and having made a beginning in his native village, he, at the age of eighteen, visited Paris, where he placed himself under the instruction of Ferdinand Elle, a Flemish portrait-painter. He did not remain long with Elle, but applied himself to composition from casts and prints after Raffaëlle and Giulio Romano. Some of his earliest attempts were the paintings in the church of the Capuchins at Blois, and some Bacchanalian pieces for the Chateau of Chiverny. He was now invited to Rome by Marino, the Italian poet, whom he met at Paris; but the "Death of the Virgin," a painting on which he was then engaged, compelled him to decline. He was enabled, however, to undertake the journey in 1624, when his friend received him with great kindness. Marino soon after died, and Poussin was for some time reduced to paint for almost nothing. He lodged with the eminent sculptor, Francis du Quesnoy, called "Il Fiamingo," and studied the works of Raffaelle with untiring devotion. Cardinal Barberini returning to Rome, to whom he had been introduced by Marino, liberally patronized him. He painted for him his celebrated pictures of the "Death of Germanicus," and the "Taking of Jerusalem by the Emperor Titus;" and he procured for him a commission to paint the "Martyrdom of St Erasmus" for St Peter's. The first series of his "Seven Sacraments of the Church of Rome," were painted for the Cavaliere del Pozzo, and are now in the collection of the Duke of Rutland. He subsequently painted another set of "Sacraments," which were purchased by the Duke of Bridgewater for 4000 guineas, and now occupy a place in the gallery of the Earl of Ellesmere. On his return to France in 1639, at the request of Louis XIII., he was made painter to the king, with apartments in the Tuileries. Here he produced his admirable work of the "Last Supper," and was engaged to decorate the gallery of the Louvre, when the criticisms of his brother artists determined him to return to Rome. He quitted France for ever in 1642, and after many years spent in the diligent practice of his art, he died on November 19, 1665.

Eight of his pictures are in the National Gallery:—"The Nursing of Bacchus;" "A Bacchanalian Festival;" "A Bacchanalian Dance;" "Phineas and his followers turned into stone at the sight of the Gorgon's head;" "Cephalus and Aurora;" "Venus Sleeping surprised by Satyrs;" "Phocion: a Landscape with Figures;" "The Plague among the Philistines at Ashdod." (*Memoirs of Nicolas Poussin*, by Maria Graham, 8vo, London, 1820.)

POWNALL, THOMAS, an able politician and antiquary, was born at Lincoln in 1722. The first part of his career was occupied with civil duties. Having repaired to America in 1753, he was appointed in succession governor of the colonies of Massachusetts, New Jersey, and South Carolina. After his return to England in 1761 he obtained a seat in Parliament, and wrote several pamphlets on the topics of the day. The latter part of Pownall's life, however, was more particularly engrossed with antiquarian studies. He contributed many papers on the antiquities of Great Britain and Ireland to the *Archæologia*. He also published *Notices and Descriptions of the Antiquities of Provincia Romana of Gaul*, 4to, London, 1788. The death of Governor Pownall took place at Bath in 1805. For a complete list of his works, see Watt's *Bibliotheca Britannica*.

POZO-BLANCO, a town of Spain, Andalusia, in the province, and 32 miles N.E. of Cordova. It stands among the hills of the Sierra Morena, and is regularly built, containing a church, two hospitals, a town-hall, several schools and hermitages. The chief manufactures are dyeing and the weaving of woollen fabrics. Pop. 6748.

POZZO DI BORGO, CARLO ANDREA, a celebrated diplomatist, was descended from an illustrious Corsican family, and was born in 1764 at Ajaccio, the town which four years afterwards became the birth-place of Napoleon Bonaparte. His first appearance before the public was in the character of the right hand man of the great Paoli. That patriotic chief sent him in 1791 to thank the constituent assembly of Paris for having recognised the island to be an integral part of the French dominions. After his return in the following year he employed his aid in the attempt to liberate the country from the jurisdiction of France, and to place it under the protection of Great Britain. When that effort was eventually successful in 1794, he recommended him to the presidentship of the newly-instituted council of state under the English viceroy. But it was not until Pozzo had been expelled from Corsica along with the British in 1797, and after being a sojourner in London and Vienna, had entered into the diplomatic service of Russia in 1803, that his real ability began to appear. An inveterate enmity which he was then cherishing against his former friend and fellow-townsman Napoleon, roused all his faculties into activity. Wherever any plan was in the act of being concerted or executed for the purpose of checking the French potentate, there was he, eloquent in council, far-sighted in policy, and unwearied in action. The year 1804 saw him in the character of Russian commissioner, with the allied forces in the north of Italy. In 1806 he was ready, as a colonel in the suite of the emperor, to march against the French, when the intelligence of the battle of Jena checked the enterprise. He then repaired to Vienna to try to rekindle the spirit of resistance in Austria. It is true that all these efforts proved unsuccessful; that his master was forced to agree to an armistice with Napoleon in 1807; and that he himself was obliged to be absent for some time from Russia. Yet the spirit of opposition within him did not bate one jot of its intensity. The interval of absence was spent in rearranging his plans, in concerting fresh measures along with the English government, and in mustering all his strength for another onset. Accordingly, no sooner had he been recalled by the Russian emperor in 1812, than he commenced a series of diplomatic strokes which effectually aided in overthrowing the power of Napoleon. It was he who prevailed upon the Swedish crown prince, Bernadotte, to join the confederacy against the French—he who counselled the allies to bring the contest to a crisis by marching upon Paris—he who warned the congress of Vienna of the possibility of Bonaparte returning from Elba. Nor when his diplomacy had done everything that it could, did his master passion become less active. He shed his blood at Waterloo to foil the last struggle of his great countryman; and when he heard that his vanquished adversary had died in St Helena, he exclaimed, with vindictive exultation, "I have not killed Napoleon, but I have thrown the last shovelful of earth upon him." After this great struggle, the remainder of Pozzo's life was chiefly occupied with the duties of Russian ambassador at the French court; and he died at Paris in February 1842. (See *Biographie Universelle*, and Gregorovius' *Wanderings in Corsica*, translated into English by Alexander Muir, Edinburgh 1855.)

PRADO, a town of Portugal, in the province of Minho, on the Cavado, 3 miles N.W. of Braga. The situation is unhealthy though beautiful; and the chief manufacture of the town is that of earthenware. There is salmon and trout fishing in the river. Pop. 6500.

PRAED, Winthrop Mackworth, a talented writer and politician, was the son of Mr Serjeant Praed, and was born in 1802. His educational career from the very first was full of the richest promise. At Eton he wrote precocious essays in a magazine called *The Etonian.* At Trinity College, Cambridge, his genius continued to develop itself, and there was scarcely a learned accomplishment in which he did not outstrip his rivals. He carried off four prizes for classical odes and epigrams, and three prizes for English poetry; he contested the leadership of the Union Debating Club with Thomas Babington Macaulay (now Lord Macaulay); and before he left the university he had produced poems in Knight's *Quarterly Magazine* which placed him among the very first of the rising literary men of that age. After practising for a short time at the bar, Praed began his parliamentary career by taking his seat in 1830 for St Germans. It is true that he failed to secure his return in 1832. But he entered Parliament again in 1835 as member for Great Yarmouth, and proved himself a great acquisition to the Tory party. Industrious in collecting his own arguments, wonderfully rapid in demolishing those of his opponents, and fervidly eloquent in enforcing his views, he became a very effective debater. A standing of great reputation and influence was already within his reach, when consumption cut him off in 1839.

PRÆFECT (*Præfectus urbi*) was originally warden of the city of Rome, and received the name of *Custos Urbis.* The title of præfect does not seem to have been used till after the time of the Decemvirs. On the absence of the king from Rome, the *custos urbis* acted as his representative; and exercised all the powers of the consuls if they were absent. Persons of consular rank were alone eligible for this office; and, down to the time of the Decemvirate every præfect had previously been consul.

On the institution of the office of *prætor urbanus*, the wardenship of the city became a mere name. In the reign of Augustus, at the suggestion of Mæcenas, an office bearing this designation was instituted, but widely different from the original. This new *præfectus urbi* was a permanent magistrate, with the superintendence of butchers, bankers, theatres, &c.; and to enable him the better to exercise his authority, he had distributed throughout the city a number of *milites stationarii*, a sort of modern police. Gradually his office extended, until he in turn swallowed up the office of *prætor urbanus.* On Constantinople becoming the second capital of the empire, it had its *præfectus urbi*; who were the direct representatives of the emperor. All the officers of the administration of the city—all corporations and public institutions were under their supervision. They received the petitions of the people addressed to the emperor; and when the capital deigned to present the emperor with an expression of their loyalty, it was through the præfect they had to approach him. (Smith's *Dictionary of Greek and Roman Antiquities.*)

PRÆMUNIRE (used for *præmonere*, to forewarn), is the first word of an ancient writ, whereby a party was summoned before the crown to answer a charge of contempt of the sovereign. The writ commenced—"Præmunire facias A. B., quod sit coram nobis," &c. The contempt consisted in the doing of some act derogatory of the allegiance due to the sovereign. The term has now the two meanings of the writ itself, and the offence to which the writ is applied.

PRÆNESTE (the modern *Palestrina*), one of the most important cities of ancient Latium, was situated about 2400 feet above the level of the sea, on the south-western side of a bastion-like projection of the Apennines. This favourable position rendered it a place of great strength and power from the earliest times. Accordingly we find the Prænestines offering a formidable opposition to the might of the Romans. In 380 B.C., taking advantage of the civil dissensions among their enemies, they marched up to the very gates of Rome. A severe defeat which Cincinnatus gave them immediately afterwards on the banks of the Allia, did not break their power. In the very next year they were again in the field, summoning the rest of the states of Latium to come to their aid against the common aggressors on the banks of the Tiber. It is true that in the great Latin war which began in 340 B.C., they were forced to submit, and become allies of the Romans. Yet, in 82 B.C., the city is found in greater strength than ever, sustaining a close blockade from the forces of Sylla. It was not until that general, after receiving its surrender, had razed its fortifications, and butchered all its inhabitants, that the power of the town received its death-blow. After this period Præneste was famous as a place of resort. People repaired from all parts of Italy, and even from foreign countries, to consult at the shrine of Fortune which overlooked the city. The wealthy and the noble came from Rome to pass the hot summer months on the breezy terraces which rose upon the hill-side. There, too, amid the roses for which the town was celebrated, might be seen such a poet as Horace, sitting over the famous nuts and wine which were grown in the neighbourhood, luxuriating in the cool zephyr which blew from the Tyrrhene sea, and looking down upon the plain which swept away, in wooded undulations, to the foot of the Alban hills.

The modern Palestrina is chiefly known on account of the remains of the ancient Præneste, which still exist. Many of the large irregular blocks of limestone which formed the wall of the citadel are to be seen at the present day. An exquisite piece of mosaic, which was dug up from among the ruins of the temple of Fortune in the seventeenth century, and which has been considered the finest specimen of its kind, is still preserved in the family of Barberini.

PRÆTOR *(for præitor* from *præire)*, a title of office among the Romans. The consuls were called prætors, as leaders of the armies of the state; but the term was especially appropriated to the *prætor urbanus*, first appointed in the year B.C. 366. He was at first chosen from the Patricians, who created this office as a sort of indemnification for being compelled to share the consulship with the plebeians. (Liv. vi. 42; vii. 1.) The plebeians, however, soon had a hand in the office; and in B.C. 337 the patricians were left to mourn the appointment of a plebeian prætor. The prætors were called colleagues to the consuls, and were created with the same auspices.

The prætorship was originally a sort of third consulship. The prætor occasionally commanded the armies of the state, instead of the consul; and when the consul was absent with the army he exercised his function within the city. The prætor was one of the *magistratus majores;* he went attended by six lictors (latterly by two), and owed respect and obedience to the consuls. A second prætor was appointed B.C. 246, to administer justice between the peregrini, or the peregrini and the citizens; and hence he received the name of *prætor peregrinus.* It was determined by lot what functions these prætors should fulfil; and when the one was at the head of the army, the other performed the duties of both within the city. On the extension of the state beyond the bounds of Italy, new prætors were chosen. Sulla increased their number to eight; Julius Cæsar raised them successively to ten, twelve, fourteen, and sixteen; and Pomponius says of his own time, "eighteen prætors administer justice in the state."

The prætor urbanus seems to have held the first rank; and as his name implied, his duties confined him to Rome. He was the chief magistrate for the administration of justice, and to him Roman law owes much of its development and improvement. The chief judicial function of the prætor consisted in giving *a judex;* and cases before the prætor were said to be *in jure.* They presided at criminal trials (*quæstiones perpetuæ*); and a body of *judices* determined by a majority of votes the condemnation or the acquittal of the party accused.

The prætors existed till a late period in the Roman empire, and seem to have held still their original right of jurisdiction. Prætors were usually appointed governors of provinces on the expiration of their official year, with the title of *proprætor.* (See *Die Prätorishen Edicte der Römer*, &c., von D. Ed. Schrader, Weimar, 1815.)

PRÆTORIANS was, during the Roman republic, a select cohort that attended the prætor or commander of an army. They frequently decided the fate of battles. After the overthrow of the republic, Augustus formed them into nine cohorts, and fixed their station in the capital as body-guards. They became, in short, under the emperors, what "the guards" are to the monarchies of Europe. They, in addition to their military duties, frequently had the charge of state prisoners, and often acted the part of executioners. They were all picked men, chosen for the most part from Italy. Their power increased greatly under the empire until they frequently determined the fate of an emperor. Diocletian reduced their number, and Constantine disbanded them.

PRAGA, a town of Poland, in the government of Warsaw, forming a suburb of the capital, on the opposite or right bank of the Vistula. It was at one time strongly fortified; but having been stormed by the Russians in 1794, it was reduced to ruins. Since that time it has been rebuilt, and it now contains many good streets and squares. Pop. 7500.

PRAGMATIC SANCTION is a solemn ordinance or decree of the head of a legislature on some matter of importance. The term is of Byzantine origin, and was used early in the French monarchy. Perhaps the most celebrated pragmatic sanction is that of Charles VII. of France in 1438, caused by the schism in the church between the Council of Basle and Pope Eugenius IV. One of the decisions of the king was the supremacy of the general council over the Pope. Twenty-three articles were signed by the king for the regulation of the Gallican Church, constituting the pragmatic sanction of Charles VII. Some twenty years afterwards, Louis XI., anxious to please Pope Pius II., gave up this pragmatic sanction of Charles VII., and it was ignominiously dragged through the streets of Rome. Some years afterwards Louis quarrelled with the Pope, and the pragmatic sanction again became law. The last pragmatic sanction which has attained historical celebrity is that of Charles VI., Emperor of Germany, who, in the year 1722, failing male issue, settled his dominions on his daughter, the Archduchess Maria Theresa, which was confirmed by the diet of the empire, and guaranteed by Great Britain, France, the States-General, and most of the European powers.

PRAGUE (Bohem. *Praha,* Germ. *Prag*), a fortified town of the Austrian empire, capital of the kingdom of Bohemia, stands on both sides of the Moldau, 160 miles N.N.W. of Vienna, and 75 S.S.E. of Dresden. No town of Germany has a greater charm for the spectator than that which Prague derives, not less from the beauty of its situation than from the many historical associations with which it is connected. In a valley surrounded on all sides by hills, and divided into two parts by the Moldau, the city rises from the river's edge, tier above tier, palace above palace, spire above spire, to the encircling heights, which are crowned by fortifications 12 miles in circumference. It consists of five portions,—The *Hradschin,* on the hill called the Schlossberg, to the left of the river; the *Kleinseite,* to the south of the former, in a semicircular valley between it and the hill called *Laurenzberg;* and on the right bank of the river the *Judenstadt,* or Jews' Town, which is inclosed by the *Altstadt,* or Old Town, and that again by the *Neustadt,* or New Town. To the extreme south of the New Town stands the citadel of Wysschrad, on black cliffs overhanging the Moldau, and connected with the fortifications which inclose the whole of the five quarters. Communication is kept up between the opposite sides of the river by two bridges; the older of these, called the Carlsbrücke, is 1850 feet long, and rests on 16 arches. It was begun in 1358, and finished in 1507. At each end stands a tower for the purpose of defence; and along the bridge there are on either side statues of saints, among which is that of St John Nepomuk, who is said to have been drowned from this very bridge. Farther up the river is an iron suspension-bridge resting on a small island in the centre. This bridge was completed in 1841. Each portion of Prague has its own distinct character. The Hradschin is remarkable for its numerous splendid edifices, many of them possessing great historical interest; the Kleinseite is the residence of the aristocracy of Bohemia, and contains many palatial mansions, with gardens stretching up to the heights above; the Jewish quarter, or as it has been called since 1850, Josephstadt, is densely peopled, and contains low, mean dwellings, and narrow, crooked, dirty streets. The Old Town is occupied by lofty old-fashioned houses, and it is here that most of the business is carried on; while the New Town, once separated from the former by a ditch that is now filled up, has many handsome convents, hospitals, &c., though the houses are generally low and small, inhabited chiefly by artisans. The Hradschiner Platz, the chief public square in that part of the city, is of an oblong shape, having on its north side the archiepiscopal palace and the residences of the prebendaries of the cathedral; on the west an imperial, on the south the Schwarzenberg palace; while on the east it is separated by a railing from the court of the castle, which includes within its limits the cathedral and buildings connected with it. The castle is an immense pile of buildings, containing, it is said, 440 apartments, but not in any way remarkable for architecture. It was from the diet chamber in this building that the nobles and deputies of Bohemia threw out of the window the imperial commissioners, Martinitz and Slavata, 23d May 1618, and thus gave rise to the Thirty Years' War. Two stone pillars mark the place where they fell, on a dunghill that saved their lives. The cathedral of St Vitus, begun in 1343 by Matthias of Arras, and carried on by Peter Arler till 1385, bears a considerable resemblance to that of Cologne. It is unfinished: the tower, originally 506 feet high, was reduced to its present height of 314 feet by a great fire in 1541; and the whole building and many of its monuments suffered severely from the artillery of the Prussians in 1757. In the interior stands a splendid mausoleum over the vault of the Bohemian kings. It is of marble and alabaster, and has many effigies and sculptures. The shrine of St John Nepomuk in this church is remarkable for the immense amount of silver with which it is decorated. The large and splendid palace of Count Czernin is now used for barracks. Opposite to it stands the Loretto chapel, an exact copy of the famous Santa Casa in Italy. Of the numerous palaces in the Kleinseite, the most remarkable is that of Wallenstein, or, as he is called here, Waldstein, where that general resided in almost regal magnificence. It still belongs to the family, and remains almost unaltered, containing a portrait of the great duke, and the horse stuffed on which he rode at the battle of Lützen. On the highest point of the Laurenzberg, and of the whole of Prague, stands the Strahow monastery, containing a library of 50,000 volumes in a splendid hall, a portrait of Ziska the blind Hussite leader, and an autograph of Tycho Brahe. A magnificent view is obtained from the height of the city of Prague and the whole country eastwards, as far as the Riesengebirge. The churches in this quarter of the town are not very remarkable, the chief being that of St Nicholas, which is rich in marble and gilding. In the Jewish town of Prague the most remarkable building is the old synagogue, a small and gloomy edifice, said to have been built by the earliest fugitives from the fall of Jerusalem. The old Jewish burial-place is a remarkable inclosure in the centre of the Judenstadt, crowded with thousands of gravestones carved with Hebrew characters, and covered with dark gray moss; it has not been used for about a century. The principal square in the Altstadt is called the Grosse Ring, which has on one side the town-hall, in the Gothic style, partially re-built in 1840, though the tower and some portions of the ancient edifice still remains. Opposite to this building stands the Teynkirche, a Gothic edifice with two tapering towers. It was at one time the church of the Hussites, and the service is still performed here in the Bohemian tongue. In this church is the grave of Tycho Brahe. The university of Prague is the oldest in Germany, having been founded in 1348 by Charles IV., after the model of that of Paris. The fame of the university, and the privileges accorded to its members, attracted students from all parts of Germany; so that in 1409 there are said to have been 40,000 students here. In that year John Huss, who was afterwards made rector, proposed measures for abridging the privileges of the foreign students, which caused the secession of a very large number. These, scattering themselves throughout Germany, founded the universities of Leipsic, Cracow, &c. That of Prague then became the centre of the Reformed doctrines taught by Huss and his school, but it never again rose to its former celebrity. It has 44 professors, and was attended in 1851 by 1390 students. In the university building, or *Carolinum*, only the law and some of the medical classes are held; the philosophical and theological faculties occupying the *Clementinum*, an immense range of buildings, originally a Jesuits' college. Here also are the library (containing nearly 130,000 volumes and numerous MSS.), the museum of natural history, the observatory, several churches and chapels, a gymnasium, and an episcopal seminary. In connection with the university there is also a large and valuable botanic garden in one of the suburbs. Among the other buildings in this part of the town is a large theatre. Here also is a monument to Francis I. of Austria, on the quay between the two bridges, somewhat resembling that of Sir Walter Scott in Edinburgh. In the Neustadt, one of the finest streets is the Ross Markt, or horse-market, nearly half a mile in length, and in breadth 150 feet at the foot and 192 at the head. At the foot is a statue of St Wenceslaus, and at the head one of St Nepomuk. At one corner of the large square, called the Vieh Markt (cattle-market), stands the town-hall, almost entirely re-built in 1806. In the same square stands the large and splendid building (originally a Jesuits' college), now used as a military hospital. The Neustadt contains also a general hospital, a public garden, and the Bohemian museum, which includes a library, collections of antiquities and of natural history. Prague contains in all 50 Roman Catholic and 2 Protestant churches, 9 synagogues, 11 monasteries, 4 nunneries, and many schools and academies, among which are 1 Protestant and 1 Jewish school. Besides the hospitals already mentioned, there are many admirably-managed benevolent institutions, including asylums for lunatics, the blind, and the deaf-and-dumb. The manufactures of the town are numerous and varied, comprising cotton, linen, silk and woollen fabrics; hosiery, hats, leather, paper, jewellery, musical and mathematical instruments, earthenware, sugar, beer, vinegar, &c. It is the centre of the whole trade of Bohemia, and derives great advantages in this respect from the means of communication afforded by the Moldau, and by the railways which connect it with Dresden on the one hand, and with Olmütz and Vienna on the other. Although the precise date of its origin is not known, there is no doubt that Prague is one of the most ancient cities of Bohemia. The Kleinseite is said to have been founded early in the eighth century, and the Altstadt, the next to it in antiquity, towards its close. From the earliest period Prague suffered very much from the ravages of war; but its greatest calamities were connected with the religious contests of the Hussite period. In the reign of Charles IV. the city had risen to such a degree of prosperity that it was not only the most populous in Germany, but a principal seat of the arts and sciences. The first rising of the Hussites took place under Zisca in 1419; it was caused by the martyrdom of John Huss and Jerome of Prague at Constance, and by the treacherous conduct of the Emperor Sigismund on that occasion. Zisca and his followers entrenched themselves on a hill which still bears his name, about half a mile E. of the walls of the city, and there they not only resisted the attacks of the emperor with 150,000 men, but totally defeated him. The Hussites, who obtained completely the upper hand in Bohemia, and made hostile inroads into the neighbouring countries, would not acknowledge Sigismund as king of Bohemia until a diet, held at Prague in 1435, when they obtained from the Roman Catholic Church the freedom to teach publicly their doctrines, and the use of the sacramental cup for the laity. During the disturbances that preceded this settlement most of the churches and convents in Prague had been dismantled or destroyed. The religious privileges thus obtained by the Bohemians remained undisturbed until the beginning of the seventeenth century, when the attempts of the emperors to invade them caused the outbreak at Prague which began the Thirty Years' War in 1618. Refusing to acknowledge Ferdinand II., they elected Frederick of the palatinate to the crown; but he was totally defeated in 1620, at the Weissenberg, near Prague. By this battle, and the persecutions which followed it, the Protestantism of Bohemia was entirely subverted. In 1631 the city was taken by the Elector of Saxony, but re-taken the next year by the imperialists under Wallenstein. In 1648 the Swedes gained possession of the Kleinseite, which they evacuated on the peace of Westphalia in the same year. At the beginning of the war of the succession in 1741, Prague was taken by the French and Bavarians; and in the following year it was blockaded by the Austrians under Charles of Lorraine. In 1744 it was taken by Frederick the Great, but restored by the peace of Dresden in the following year. In 1757 Frederick defeated the Austrians in the battle of Prague, and besieged the city, but was compelled to raise the siege by his defeat at Kollin. Since that period Prague has once again suffered from the devastations of war. In 1848 the Czechs, or Bohemian party, rose against the Austrians, and a desperate contest ensued between them. The military, under Prince Windischgrätz, having gained possession of the Hradschin, bombarded from thence the rest of the city on the 17th of June, and on the 19th the insurrection was entirely put down. Pop. (1851), exclusive of military, 118,405.

PRAM, Christian Henriksen, an eminent Danish poet, was born in 1756, and was educated at the university of Copenhagen. A comfortable situation which he obtained in the Chamber of Commerce enabled him to devote a considerable portion of his time and energy to literature. His *Stoerkodder*, a narrative poem in fifteen cantos, founded on some of the old Scandinavian legends, introduced him to the notice of the public. He then commenced a periodical called the *Minerva*, and contributed to its pages many pieces both in prose and verse. He also wrote two tragedies, entitled *Damon and Pythias*, and *Frode and Fingal*, several comedies, and some smaller plays. In spite of the success of all these productions, the close of Pram's life was rather melancholy. He was deprived of his post in the Chamber of Commerce in 1816; his wife died in 1819; and in 1820 he emigrated to the island of St Thomas, only to expire there in the following year. A collection of Pram's works was published by his friend Rahbek, in 4 vols., 1824–26.

PRATO, a town of the grand duchy of Tuscany, in a fertile plain near the foot of the Apennines, 11 miles N.W. of Florence. Containing well-built houses and regular streets, and surrounded by old walls and ditches, the appearance of the town is cheerful and pleasant. In the principal square stands the cathedral, with its campanile or bell-tower; and several other buildings. The most striking feature of the cathedral is the alternate stripes of black and green serpentine with which the grey limestone of this fine edifice is inlaid, both outside and inside. It contains a beautiful painted window, and some of the best pictures of Filippo Lippi. Among the other buildings of Prato are the church of La Madonna delle Carceri, with a beautiful cupola; the Palazzo Pretorio, now used as a prison; and a college that once belonged to the Jesuits. There are also a theatre, public library, and several hospitals. Coarse woollen cloth is made here in large quantities; also red Turkish caps, ropes, paper, glass, hardware, &c. From Prato London derives supplies of straw plait, which is made by the peasantry in the adjacent country. Pop. 12,000.

PRATT, Charles, Viscount Bayham and Earl Camden, was the third son of Sir John Pratt, chief-justice of the King's Bench under George I., by his second wife Elizabeth, daughter of the Rev. Hugh Wilson, canon of Bangor, and was born in 1713, the last year of the reign of Queen Anne. He had the misfortune to lose his father when only ten years old; and from the reduced circumstances of his family, he was placed upon the foundation at Eton. Here he had the good fortune to form a lasting friendship with William Pitt, afterwards the "Great Commoner," one of the noblest spirits of the place. He went to Cambridge in October 1731, where he began that course of juridical and constitutional study which afterwards rendered his name so illustrious. In 1735 he took B.A., and was called to the bar in Trinity term 1738. He rode the Western Circuit for the following eight or nine years without receiving fees sufficient to pay the tolls. Disgusted with this sort of life, he resolved to enter the church, when Henley, afterwards Lord Northington, ridiculed the idea with his accustomed raillery, and from that day Pratt's progress was determined. At the next assize town, "it so happened" that Pratt was called to fill the leader's place, when he made a most animated and eloquent reply, obtained the verdict, was complimented by the judge, and received several retainers before he left the hall. He was made a king's counsel in 1755; and in 1757 he was appointed attorney-general by his old friend Pitt, who was at the head of affairs. He received the honour of knighthood shortly afterwards, and was returned to Parliament for the close borough of Downton. He subsequently married Elizabeth, daughter and co-heir of Nicolas Jefferys, Esq. of Brecknock Place. While attorney-general he had ample opportunity of acting upon those great principles of justice for which he had contended so long. When John Wilkes was seized and committed to the Tower on a charge of publishing, in the *North Briton*, No. xlv., a paper calculated to inflame the minds of the populace against the government, his lordship granted him a *habeas corpus;* and on being brought before the Court of Common Pleas, discharged him from his confinement, amid the shouts of the people, which were heard with dismay at St James's. After the liberation of Wilkes, he condemned successively "general warrants" and "search warrants for papers," which rendered him the idol of the nation. Busts and prints of him were hawked through remote villages; a Reynolds portrait of him was hung up in Guildhall; he had the freedom of London presented to him in a gold box; he grimly laid down the law from sign-posts; and English journals and travellers carried his fame over Europe. A peerage was inevitable; and a peerage came.

He was styled "Baron Camden, of Camden Place, in the county of Kent," on the 16th July 1765; and next year, by the resignation of Lord Northington, he was made lord high chancellor of Great Britain. His attitude of opposition to the American taxation cost him his office in 1770. On the fall of Lord North he was again taken into the administration; and on the 27th of March 1782 appointed president of the Council, and so important were the lord president's services esteemed, that he was raised in the peerage by being created "Viscount Bayham, of Bayham Abbey, in the county of Kent, and Earl Camden," on the 13th May 1786. The last occasion upon which he took part in the debates was upon the discussion of Mr Fox's celebrated Libel Act in 1792. He died in April 13, 1794, in his eightieth year. (See Lord Campbell's *Lives of the Lord Chancellors*, vol. v.)

PRAXITELES, a very distinguished artist of ancient Greece, who wrought both in bronze and marble. Hardly anything is known of his personal history. Pliny alludes to him (*Hist. Nat.*, xxxiv. 8, § 19) as contemporary with Euphranor, B.C. 364, a date which probably determines the beginning of his artistic career. Judging from an inscription still extant, in which Praxiteles is called an Athenian, he must either have been a native, or at least a citizen of Athens. His position as an artist can be ascertained with more definiteness. He stands with Scopas at the head of the later Attic school, so called in contradistinction to the earlier Attic school of Phidias. If Phidias exceeded all men in his idealization of divine majesty and sublimity, Praxiteles was unsurpassed in his exhibition of the softer beauties of the human form, and especially of female grace. He is reported by Pliny to have made two statues of the goddess Aphrodite, the one draped and the other not. The inhabitants of Cos, of severe virtue, bought the draped statue; while the inhabitants of Cnidus, of less rigid tastes, chose the naked figure. The choice of the Cnidians entirely eclipsed its rival. According to Pliny, it surpassed all other works, not only of Praxiteles, but in the whole world; and all who had leisure voyaged to Cnidus expressly to behold it. King Nicomedes offered to pay off the whole of the heavy public debt of the Cnidians if they would let him have it, but to no purpose. It was afterwards borne to Constantinople, where it was destroyed by fire. Of the numerous descriptions of this masterpiece, the most satisfactory is that of Lucian. The material was Parian marble of the most brilliant character; the form was in all respects perfect; the right hand held some drapery, which fell over a vase standing by the goddess; and her face wore a gentle smile. This was the first instance in which any artist had ventured to represent this divinity entirely divested of drapery. The artist modelled it after a favourite courtezan named Phryne, who became possessed of his statue of Eros in the following manner:—Praxiteles, in his fondness for the courtezan, had promised to give her whichever of his works she might choose. She was anxious to learn which of them, in his own opinion, was the best; but this was precisely what the artist was unwilling to disclose. Not to be baffled, Phryne sent a slave to inform Praxiteles that a fire had broken out in his house, and that nearly all his works had perished. On hearing this, the artist rushed out, exclaiming frantically that all his toil was lost if the fire had reached his Satyr or his Eros. Phryne lost no time in confessing the stratagem, and claimed the Eros, which Praxiteles, however unwillingly, allowed her to carry off.

Of his statuary in bronze, the most noted was the Dionysus which stood at Elis. It represented the god, clad in ivy, girt with a faun's skin, bearing the lyre and the thyrsus. Of his subjects from the mythology of Apollo, the most celebrated statue was the bronze figure of Apollo the lizard-slayer. A full enumeration of the works of Praxiteles are to be found in Sillig (*Cat. Artif.*)

PREBEND, the maintenance a prebendary receives out of the estate of a cathedral or collegiate church. Prebends are distinguished into simple and dignitary. A simple prebend has no more than the revenue for its support; but a prebend with dignity has always a jurisdiction annexed to it.

PRECEDENCE, a place of honour to which a person is entitled either by courtesy or by right. The former is that which is due to age, estate, or the like, and is regulated by custom and civility; the latter is settled by authority, and when broken in upon, gives an action at law.

In Great Britain, the order of precedency is as follows:—(1) The sovereign, (2) the queen's consort, (3) the princes of the blood, (4) the archbishop of Canterbury, (5) the lord high chancellor, (6) the archbishop of York, (7) the archbishop of Armagh, (8) the archbishop of Dublin, (9) the lord treasurer of England, (10) the lord president of the council, (11) the lord privy seal, (12) dukes, (13) the eldest sons of dukes of the blood royal, (14) marquises, (15) dukes' eldest sons, (16) earls, (17) marquises' eldest sons, (18) dukes' younger sons, (19) viscounts, (20) earls' eldest sons, (21) marquises' younger sons, (22) bishops, (23) barons, (24) speaker of the House of Commons, (25) lord commissioner of the great seal, (26) viscounts' eldest sons, (27) earls' younger sons, (28) barons' eldest sons, (29) knights of the Garter, (30) privy councillors, (31) chancellor of the exchequer, (32) chancellor of the duchy, (33) lord chief justice of the Queen's Bench, (34) master of the Rolls, (35) lord chief justice of the Common Pleas, (36) lord chief baron of the Exchequer, (37) puisne judges and barons, (38) knights banneret if made in the field, (39) masters in Chancery, (40) viscounts' younger sons, (41) barons' younger sons, (42) baronets, (43) knight banneret, (44) knights of the Bath, (45) knights bachelors, (46) baronets' eldest sons, (47) knights' eldest sons, (48) baronets' younger sons, (49) field and flag officers, (50) serjeants at law, (51) doctors graduate, (52) esquires, (53) knights' younger sons, (54) clergymen, (55) gentlemen bearing coat armour, (56) citizens and burgesses of towns corporate, (57) yeomen, (58) tradesmen, (59) artificers, (60) labourers. It is to be observed, that ladies, except those of archbishops, bishops, and judges, take place according to the degree of quality of their husbands; and unmarried ladies take place according to that of their fathers.

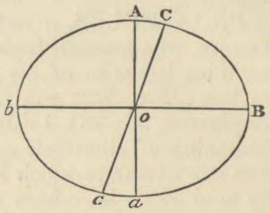
PRECESSION OF THE EQUINOXES.

In the article Astronomy (vol iv. 14), the phenomenon of the annual precession of the equinoxes has been described, and its physical cause stated to be the attraction of the sun and moon upon the protuberant mass of matter accumulated about the earth's equator, combined with the diurnal rotation. We shall here discuss the subject more particularly, and shew in what manner the different forces which tend to displace the plane of the earth's equator give rise to the phenomenon in question, and how their effects are computed from the fundamental principles of dynamics. The general problem, which is that of determining the perturbations of the earth's axis of rotation, embraces the *Nutation* of the axis, as well as the precessional motion of the equinoctial points, and is one of the most important and interesting in physical astronomy.

If the earth were a perfect sphere, the attraction of the sun or moon would have no tendency to communicate to it any motion about its centre of gravity. In this case, all the particles being symmetrically disposed with reference to every plane passing through its centre, the forces acting on opposite sides of any plane passing through its centre and the centre of the attracting body, would exactly balance each other, and consequently would have no tendency to produce a rotatory motion. But by reason of the spheroidal form of the earth, and the intensity of the force of attraction varying with the distance, the action of a distant body which is not situated either in the plane of the equator, or in the prolongation of the axis of rotation, produces an unequal effect on the opposite sides of every plane passing through the earth's centre (excepting the meridian in which the body is situated), and tends to generate a rotatory motion about that diameter of the equator which is perpendicular to the line which joins the centre of the earth with the centre of the attracting body. Hence the sun exerts a force, which at every instant has a tendency to bring the plane of the earth's equator towards the plane of the ecliptic; and if the earth had no motion of rotation about its axis, the two planes would at length be brought to coincide. In consequence, however, of the rotatory motion, the inclination of the two planes, as we shall shew, undergoes no permanent alteration; but a motion is given to the earth's axis, such that the pole of the equator constantly revolves about the pole of the ecliptic in the direction opposite to that of the diurnal rotation, and the intersection of the equator and ecliptic, following the motion of the pole, is carried backwards along the ecliptic. The moon produces a similar effect in reference to the plane of the lunar orbit; and the motion produced by the combined action of the sun and moon, which is the phenomenon observed, is the *luni-solar* precession of the equinoxes.

As the efficacy of the disturbing force to turn the earth about an axis varies with the distance of the attracting body from the plane of the equator, the precessional motion of the equinoxes is not uniform. The efficacy of the sun's force continues to increase, whilst the sun passes from either equinox to the solstice, and to diminish while it passes from the solstice to the equinox. The period of the inequality is consequently half a-year. The period in which the action of the moon passes through all its degrees of intensity is about nine years, being that in which the nodes of the lunar orbit accomplish half a revolution on the ecliptic. The apparent effect of this irregular action, is an alternate increase and diminution of the declinations of the fixed stars, most sensible for those nearest the pole, which is characteristically called the ***nutation*** of the earth's axis. The solar nutation, however, is so small as to be insensible to observation; the lunar nutation is sufficiently sensible, amounting to about 18″ between the extreme positions of the pole.

Before proceeding with the investigation of the problem, it will be convenient to premise the two following elementary theorems respecting the composition of rotatory motion, referring the reader for their demonstration to the article Rotation.



Theorem 1. If a rigid body revolving about an axis Aa, which passes through its centre of gravity O, with an angular velocity $=v$, receive an impulse which alone would cause it to revolve about an axis Bb, also passing through its centre of gravity, with a velocity $=\phi$, the body will now revolve about a third axis Cc, passing through its centre of gravity, and lying in the plane of the two axes Aa and Bb, and so situated that the sine of its inclination to the axis Aa will be to the sine of its inclination to the axis Bb, as the velocity about Bb to the velocity about Aa; that is, the new axis will divide the angle AOB, so that $\sin \text{AOC} : \sin \text{BOC} :: \varphi : v$.

In order to determine whether the pole C of the new axis lies between A and B, or between A and b, it is only necessary to consider that the new axis must evidently be that line in the body in which every point is at rest in respect of both motions. If, therefore, we suppose the original motion about Aa, to be in the direction which would raise the point B above the plane of the paper, and to depress b below it, and the new impulse to be given in the direction which would depress the point A below the plane of the paper, and raise a above it, then C will lie between A and B; but if the new impulse tends to raise A above the plane of the paper, then C will lie between A and b.

Corollary 1. If the two axes Aa and Bb are at right angles, then $\sin \text{BOC} = \cos \text{AOC}$, and we have $\dfrac{\sin \text{AOC}}{\cos \text{AOC}} = \dfrac{\varphi}{v}$, that is, $\tan \text{AOC} = \dfrac{\varphi}{v}$.

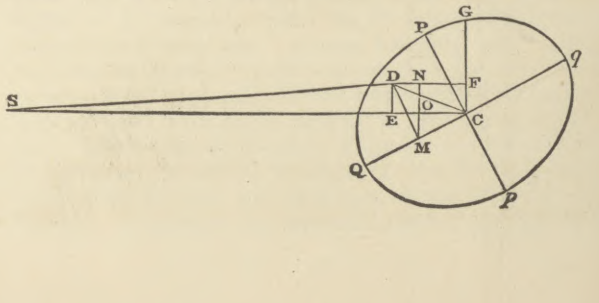
Cor. 2. If the impulse is renewed at every instant of time, the axis about which the body actually revolves must have a uniform motion in space from OA towards OB.

Theorem 2. If the force which tends to give the body a motion of rotation about an axis which is always perpendicular to the axis about which it is already revolving, and situated in the plane AOB, be uniform, the angular velocity of rotation remains unaltered, or v is a constant quantity.

These theorems, which are true of bodies in general, whatever be their figure, were first demonstrated by Frisi.

Proposition 1. To determine the efficacy of the sun's attraction to turn the spheroid about its centre, the earth being supposed homogeneous.

Let Pp be the axis of rotation, Qq the projection of the equator, S the sun, C the centre of the spheroid, and D



the projection of a point in the interior of the spheroid on the plane PQpq. Join SC, SD, DC; and draw CG perpendicular to SC, and DE, DF respectively perpendicular to SC, CG.

Let f represent the force of the sun's attraction on a particle at the centre C, and f' the force of its attraction on a particle at D, then the attraction being inversely as the square of the distance, we have $f'=f.\frac{\mathrm{SC}^2}{\mathrm{SD}^2}$. Now the force f', which acts on D in the direction SD, may be resolved into two; one in the direction CD, which has no tendency to turn the spheroid about its centre, and the other in the direction FD parallel to SC, which tends to turn the spheroid in the direction PQ about an axis passing through C, and perpendicular to the plane PQpq. The resolved part of the force f', in the direction FD is $f\cdot\frac{\mathrm{SC}^2}{\mathrm{SD}^2}\cdot\frac{\mathrm{SC}}{\mathrm{SD}}$, since SD is the diagonal of a parallelogram of which SC and CD are the sides. Now, if the resolved force in the direction FD parallel to SC were the same on every particle, and equal to f, it would have no tendency to produce rotation in the spheroid; we may therefore conceive the force on any particle which tends to produce rotation to be the difference between the part of the force acting on that particle in the direction parallel to SC, and the force f acting on the particle at C. Hence the force on D tending to impress a rotatory motion on the spheroid is $f\cdot\left(\frac{\mathrm{SC}^2}{\mathrm{SD}^2}\cdot\frac{\mathrm{SC}}{\mathrm{SD}}-1\right)=f\cdot\frac{\mathrm{SC}^3-\mathrm{SD}^3}{\mathrm{SD}^3}=f\cdot\frac{(\mathrm{SC}-\mathrm{SD})\,(\mathrm{SC}^2+\mathrm{SC}\cdot\mathrm{SD}+\mathrm{SD}^2)}{\mathrm{SD}^3}$. Now, by reason of the great distance of the sun in comparison of the radius of the earth, SD is very nearly parallel to SC, and equal to SC—CE. Substituting therefore SC—CE for SD, and neglecting terms divided by SC^2 which are so small as to be altogether insensible, the factor $\frac{\mathrm{SC}^2+\mathrm{SC}\cdot\mathrm{SD}+\mathrm{SD}^2}{\mathrm{SD}^3}$ becomes $\frac{3}{\mathrm{SD}}$, and consequently the above expression is reduced to $3f.\frac{\mathrm{CE}}{\mathrm{SD}}$, or to $3f.\frac{\mathrm{CE}}{\mathrm{SC}}$, since the difference between $1\div\mathrm{SD}$ and $1\div\mathrm{SC}$ is a quantity divided by SC^2, and therefore insensible. This is the part of the force on D which tends to turn the spheroid about the diameter of the equator which is perpendicular to Qq; and by the principles of mechanics, its efficacy in communicating a rotatory motion to the spheroid is proportional to the distance of its line of direction from the axis, that is, proportional to CF; whence the moment of the force at the point D becomes $3f.\frac{\mathrm{CE}\cdot\mathrm{CF}}{\mathrm{SC}}$.

Assume $r=\mathrm{SC}$, and let S denote the absolute force of the sun, then $f=\mathrm{S}\div r^2$; and if $k=$ the density at D, then kdm is the quantity of matter in the particle dm at D, and the moment of the force on that particle tending to produce in the spheroid a motion about its centre in the direction QP (which is the general direction of the motion produced by the forces on all the particles) is $-\frac{3\mathrm{S}}{r^3}.\ \mathrm{CE.CF}.\ k.dm$, the integral of which must be taken for the whole spheroid.

Draw DM parallel to Pp, and MN perpendicular to DF, meeting SC in O, and make

$$\mathrm{CM}=\mathrm{X},\ \mathrm{DM}=y,\ \mathrm{SCP}=\theta,$$

(θ being the complement of the sun's declination) then $\mathrm{CE}=\mathrm{DN}+\mathrm{NF}=y\cos\theta+x\sin\theta$, and $\mathrm{CF}=\mathrm{MN}-\mathrm{MO}=y\sin\theta-x\cos\theta$, whence the moment of the force impressed on D becomes

$$\frac{3}{r^3}\,kdm\left\{(x^2-y^2)\sin\theta\cos\theta+xy\,(\cos^2\theta-\sin^2\theta)\right\}.$$

In order to find the integrals $\int kx^2dm$, $\int ky^2dm$, $\int kxydm$ for every particle in the spheroid, let z be the co-ordinate perpendicular to the plane of the figure, and conceive the whole spheroid to be divided into an infinite number of thin slices parallel to the plane of yz, the thickness of each slice being dx; suppose, again, each slice to be divided into an infinity of parallelepipeds, parallel to the axis z, and terminated by the surface of the spheroid, the breadth of each being dy; and, lastly, let each parallelepiped be divided into an infinite number of lengths, each $=dz$. The element of the volume, dm, then becomes $dxdydz$; and consequently the sum of kx^2dm in respect of every particle is expressed by the triple integral $\iiint kx^2dxdydz$.

Assuming x^2, dx and dy to be constant, and integrating with respect to z, we obtain $kx^2dxdyz+\text{const}$. Let $a=$ the semi-diameter of the equator, $b=$ the polar semi-axis, and the equation of the spheroid is $\frac{x^2}{a^2}+\frac{y^2}{b^2}+\frac{z^2}{a^2}=1$, from which the limits of z must be found. This equation gives for a point at the surface, $z=\pm a\sqrt{1-\frac{x^2}{a^2}-\frac{y^2}{b^2}}$, and between those values of z the definite integral becomes

$$2\,kax^2dxdy\sqrt{1-\frac{x^2}{a^2}-\frac{y^2}{b^2}}.$$

This expresses the sum of kx^2dm for the parallelepiped corresponding to a given value of x.

If we next suppose x^2 and dx to be constant, and integrate this expression with respect to y, we shall have the sum of kx^2dm for the slice, the distance of which from the plane yz is x. Make $1-\frac{x^2}{a^2}=\frac{u^2}{b^2}$, or $u^2=b^2-\frac{b^2x^2}{a^2}$, and the expression becomes $\frac{2kax^2dx}{b}\sqrt{u^2-y^2}.\,dy$. In integrating this expression, the limits of y, in respect of any given value of x, are obtained from the equation of the section of the ellipsoid in the plane xy, namely $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$. This equation gives $y^2=b^2-\frac{b^2x^2}{a^2}$; whence, at the limits $y^2=u^2$, and therefore $y=\pm u$. Now, by a known formula, the integral $\int\sqrt{u^2-y^2}.dy$ from $y=-u$ to $y=+u$ is $\frac{1}{2}\pi u^2$ (π being the ratio of the circumference to the diameter); therefore the integral of x^2dm for the slice corresponding to a given value of x is $\frac{\pi kau^2x^2dx}{b}$; which, on substituting for u^2, its value $b^2-\frac{b^2}{a^2}x^2$, becomes

$$\pi k\frac{b}{a}(a^2x^2-x^4)dx.$$

We have, lastly, to integrate this expression from $x=-a$ to $x=+a$. The integral between those limits is $\frac{2\pi kl}{a}\left(\frac{a^5}{3}-\frac{a^5}{5}\right)$; whence we have ultimately, in respect of the whole spheroid,

$$\iiint kx^2dxdydz=\tfrac{4}{15}\pi ka^4b.$$

On going through the same process for y^2dm, or $y^2dxdydz$, and observing that the integral $\int y^2\sqrt{u^2-y^2}.dy$ from $y=-u$ to $y=+u$ is $\frac{1}{8}\pi u^4$, there results for the whole spheroid

$$\iiint ky^2dxdydz=\tfrac{4}{15}\pi ka^2b^3.$$

With respect to the remaining integral $\int xydm$, it is easy to see that its value in respect of the whole spheroid must be 0, for on integrating $kxydxdydx$ with respect to x, there results $\frac{1}{2}kx^2ydydz$, which vanishes on giving x all values between $-t$ and $+t$, t being any definite quantity.

From these values of $\int x^2dm$, $\int y^2dm$, $\int xydm$, we obtain the following expression for the moment of all the forces impressed on the spheroid,

$$\frac{3S}{r^3}\cdot\frac{4\pi}{15}ka^2b(a^2-b^2)\sin\theta\cos\theta.$$

Prop. 2. To determine the efficacy of the sun's attraction to turn the spheroid about its centre, the earth being supposed heterogeneous.

Conceive the spheroid to be composed of infinitely thin concentric layers, bounded by spheroidal surfaces, and suppose the ellipticity and density to be different for each layer, but both to be functions of the distance from the centre of the spheroid. Let α and β be respectively the equatorial and polar semi-diameters of the layer which contains a particle dm, $e=$ its ellipticity, and k its density. In order to find the moment of all the forces impressed on the spheroid, we must first find an expression in terms of β, for their moment on the elementary layer containing dm, and then integrate this expression from $\beta=0$ to $\beta=b$. Now, suppose all the matter of the spheroid exterior to the layer in question to be removed, and suppose also for a moment the matter in the interior of the spheroidal surface passing through dm to be all of the same density, k, then the moment of the impressed forces on the spheroid whose surface passes through dm, is by the last proposition

$$\frac{3S}{r^3}\cdot\frac{4\pi}{15}k\alpha^2\beta(\alpha^2-\beta^2)\sin\theta\cos\theta.$$

The variable part of this expression is $k\alpha^2\beta(\alpha^2-\beta^2)$. Now, since $\alpha=\beta(1+e)$, we have, on neglecting terms multiplied by e^2, which, by reason of the smallness of the earth's ellipticity are altogether insensible, $\alpha^2=\beta^2+2\beta^2e$ and $\alpha^2-\beta^2=2\beta^2e$, whence $k\alpha^2\beta(\alpha^2-\beta^2)=2k\beta^5e$. Suppose now the semi-axis β to receive an infinitely small increment, and to become $\beta+d\beta$; then since k and e are both functions of β, the expression $2k\beta^5e$ will become $2k\beta^5e+\frac{2d(k\beta^5e)}{d\beta}d\beta$. This is the variable part of the moment of the forces on the spheroid whose semiaxis is $\beta+d\beta$; consequently, in respect of the spheroidal layer which remains on subtracting the spheroid whose semiaxis is β, it becomes $\frac{2d(k\beta^5e)}{d\beta}d\beta$. Let the integral of this expression between the limits $\beta=0$ and $\beta=b$ be denoted by $2\,F(\beta)$; then the moment of all the forces impressed on the spheroid supposed heterogeneous is

$$\frac{3S}{r^3}\cdot\frac{8\pi}{15}F(\beta)\sin\theta\cos\theta.$$

Prop. 3. To determine the angular velocity φ generated by the sun's force, and the position of the equator after the infinitely small time dt.

By dynamics, the angular velocity of rotation is equal to the moment of the impressed forces divided by the moment of inertia of the mass to be moved. Now, the moment of inertia of a body, with respect to a given axis of rotation, is the sum of the products obtained by multiplying each particle of the body into the square of its distance from the axis; that is, in respect of the axis z, about which the impressed forces tend to turn the spheroid, the moment of inertia is $\int(x^2+y^2)dm$, supposing the spheroid homogeneous, and the density $k=1$. But it has been shewn that in this case $\int x^2dm=\frac{4}{15}\pi a^4b$, and $\int y^2dm=\frac{4}{15}\pi u^2b^3$; therefore the moment of inertia of the spheroid is $\frac{4}{15}\pi a^2b(a^2+b^2)$. And by prop. 1, the moment of the impressed forces is $\frac{3S}{r^3}\cdot\frac{4}{15}\pi a^2b(a^2-b^2)\sin\theta\cos\theta$, therefore

$$\varphi=\frac{3S}{r^3}\cdot\frac{a^2-b^2}{a^2+b^2}\sin\theta\cos\theta.$$

In the case of the heterogeneous spheroid the moment of inertia is thus found. As before, let α and β be the equatorial and polar semiaxes of the spheroidal surface passing through the particle dm, then if the matter within this surface be supposed of uniform density $=k$, the moment of inertia of this spheroid, by what is already shewn, is $\frac{4}{15}\pi k\alpha^2\beta(\alpha^2+\beta^2)$. But $\alpha^2+\beta^2=2\beta^2+2\beta e$, and $\alpha^2\beta=\beta^3+2\beta^3e$, therefore $\alpha^2\beta(\alpha^2+\beta^2)=2\beta^5+6\beta^5e$; and since e is a very small quantity, the second term of this expression is very small, and may be neglected in comparison of the first; therefore $k\alpha^2\beta(\alpha^2+\beta^2)=2k\beta^5$. For the spheroid whose semiaxis is $\beta+d\beta$, this quantity becomes $2k\beta^5+\frac{2d(k\beta^5)}{d\beta}d\beta$, and therefore in respect of the elementary spheroidal layer the semiaxes of whose interior and exterior surfaces are β and $\beta+d\beta$, it is $\frac{2d(k\beta^5)}{d\beta}d\beta$. Let $2F'(\beta)$ denote the integral of this quantity from $\beta=0$ to $\beta=b$, that is, let $\int\frac{d(k\beta^5)}{d\beta}d\beta=2F'(\beta)$, and the moment of inertia of the heterogeneous spheroid becomes $\frac{8\pi}{15}F'(\beta)$. But the moment of the impressed forces is by prop. 2, $\frac{3S}{r^3}\cdot\frac{8\pi}{15}F(\beta)\sin\theta\cos\theta$, therefore in the case of the heterogeneous spheroid,

$$\phi=\frac{3S}{r^3}\cdot\frac{F(\beta)}{F'(\beta)}\sin\theta\cos\theta.$$

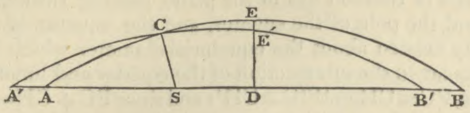
Let us assume $K=\frac{a^2-b^2}{a^2+b^2}$ in the case of the homogeneous spheroid, and $K=\frac{F(\beta)}{F'(\beta)}$ in the case of the heterogeneous spheroid, and we have for both cases

$$\phi=\frac{3S.K}{r^3}\sin\theta\cos\theta.$$

Now to find the place of the pole, and the position of the equator after the small interval of time dt, we must apply the first of the two theorems above premised. If the earth had no diurnal rotation, the sun's force would cause it to revolve about an axis passing through C perpendicular to the meridian P Qpq, or perpendicular to the plane of the paper, so as to bring the point Q nearer to the line SC, with a velocity $=\phi$. But the earth is already revolving about the axis Pp, with a velocity $=v$, and in the direction which raises the point q above the plane of the paper. Hence, by theorem 1, the new axis of rotation will be in the plane passing through Pp, perpendicular to the plane of the paper, and after the time dt will make with Pp an angle whose tangent $=\frac{\phi}{v}$, the pole P rising above the plane of the paper; and the new equator will intersect the former in the line Qq, and make with it an angle whose tangent is also $\frac{\phi}{v}$. The effect of the compound motion is thus to twist as it were the equator about the line Qq as an axis, or about that diameter of the equator which lies in the same meridian with the sun, instead of twisting it about the diameter perpendicular to that meridian, as would be the case if the earth had no diurnal motion.

Prop. 4. To find the amount of the solar precession after any given time.

Let AB be the intersection of the plane of the ecliptic, with the surface of sphere whose centre is at the centre of the earth; let ACB be the equator, and S the projection of the sun's place in the ecliptic. Now, the plane of the



equator being always perpendicular to the axis of rotation, when the axis changes its position the equator will also change its position, and the new equator will intersect the former in an angle equal to the deviation of the axis. Let A′CB′ be the new position of the equator, after the infinitely small time *dt*, intersecting the former in C, then the angle ACA′ is the measure of the momentary deviation of the axis, and AA′, which is the amount of variation in the place of the node, is the precession in the time *dt*.

From the known properties of spherical triangles we have sin SAC : sin ACA′ :: sin A′C : sin AA′. But because ACA′ is a very small angle, and AA′ a very small arc, the arcs may be taken instead of the sines; whence, since A′C=AC, the proportion gives $\mathrm{AA'}=\mathrm{ACA'}\dfrac{\sin \mathrm{AC}}{\sin \mathrm{SAC}}$.

But by the last proposition $\tan \mathrm{ACA'}=\dfrac{\phi}{v}=\dfrac{3\mathrm{S.K}}{vr^3}\sin\theta\cos\theta$, therefore, as the small arc may be substituted for its tangent,

$$\mathrm{AA'}=\frac{3\mathrm{S.K}}{vr^3}\,\frac{\sin \mathrm{AC}}{\sin \mathrm{SAC}}\sin\theta\cos\theta.$$

It will now be convenient to express this value of AA′ in terms of the sun's longitude and the obliquity of the ecliptic. Since the equator, as was shewn in the last proposition, is twisted about the diameter which is in the same meridian with the sun, it follows that the line joining S and C is a part of the meridian; whence ACS is a right angle, and SC (the sun's declination)$=90°-\theta$. Let l=AS, (the sun's longitude), and I=SAC, (the obliquity of the ecliptic), then, in the right angled spherical triangle SAC, we have cos SC . cos AC=cos AS, or $\sin\theta\cos \mathrm{AC}=\cos l$; and $\sin \mathrm{SC}=\sin \mathrm{SAC}\sin \mathrm{AS}$, or $\cos\theta=\sin \mathrm{I}\sin l$, therefore $\sin\theta\cos\theta=\dfrac{\sin \mathrm{I}\sin l\cos l}{\cos \mathrm{AC}}$. Again, in the same triangle we have tan AC=cos SAC tan AS, whence $\sin \mathrm{AC}=\cos \mathrm{AC}\cos \mathrm{I}\tan l$, and (dividing by sin SAC= sin I) $\dfrac{\sin \mathrm{AC}}{\sin \mathrm{SAC}}=\dfrac{\cos \mathrm{AC}\cos \mathrm{I}\sin l}{\sin \mathrm{I}\cos l}$. Substituting these values of $\sin\theta\cos\theta$ and $\dfrac{\sin \mathrm{AC}}{\cos \mathrm{AC}}$ in the above value of AA′, we get

$$\mathrm{AA'}=\frac{3\mathrm{S.K}}{vr^3}\cos \mathrm{I}\sin^2 l.$$

This is the solar precession in the element of time *dt*; consequently for a given time T we have

$$\text{solar precession}=\frac{3\mathrm{S.K}\cos \mathrm{I}}{v}\int\frac{\sin^2 l}{r^3}\,dt,$$

the integral being taken from $t=0$ to $t=\mathrm{T}$.

To prepare this expression for integration, r^3 and dt must be expressed in terms of l and known quantities. Let a=semiaxis major of the earth's orbit, ϵ=its eccentricity, T=a sidereal year, then r being the radius vector, and dl the angle described in the time dt, $\frac{1}{2}r^2dl$ is the space passed over by the radius vector in the element of the time, and by Kepler's law of the equable description of areas, we have $dt : \mathrm{T} :: \frac{1}{2}r^2dl$: area of orbit.

Now the area of the orbit is $\pi a^2\sqrt{1-\epsilon^2}$, therefore this proportion gives $dt=\dfrac{\mathrm{T}r^2dl}{2\pi a^2\sqrt{1-\epsilon^2}}$. But it is shewn in the article Astronomy, part iii. art. 10, that $\mathrm{T}=2\pi\sqrt{a}\div\sqrt{\mathrm{F}}$, where F is the attracting force at the mean distance *a*. But we have assumed S to denote the sun's force at the unit of distance; therefore, the forces being inversely as the squares of the distances, $\mathrm{F}=\mathrm{S}\div a^2$, whence $\mathrm{T}=\dfrac{2\pi a^{\frac{3}{2}}}{\sqrt{\mathrm{S}}}$

From this formula we get $\mathrm{S}=\dfrac{4\pi^2a^3}{\mathrm{T}^2}$, and therefore $\dfrac{\mathrm{S}.dt}{r^3}=\dfrac{2\pi a\,dl}{\mathrm{T}r\sqrt{1-\epsilon^2}}$. Again, assuming λ= longitude of sun's perigee, the polar equation of the ellipse gives $r=\dfrac{a(1-\epsilon^2)}{1+\epsilon\cos(l-\lambda)}$; whence $\dfrac{\mathrm{S}.dt}{r^3}=\dfrac{2\pi\{1+\epsilon\cos(l-\lambda)\}dl}{\mathrm{T}(1-\epsilon^2)^{\frac{3}{2}}}$, and the above expression becomes

$$\text{solar precession}=\frac{6\pi\mathrm{K}\cos \mathrm{I}}{\mathrm{T}v(1-\epsilon^2)^{\frac{3}{2}}}\int\sin^2 l\{1+\epsilon\cos(\lambda-l\}dl.$$

The expression under the sign of integration consists of two parts, of which the first $\int\sin^2 l\,dl=\frac{1}{2}(\mathrm{C}+l-\cos l\sin l)$. (See Fluxions, art. 153.) The second part, namely $\int\epsilon\sin^2 l\cos(l-\lambda)dl$, when integrated becomes $\epsilon\sin(l-\lambda)-\frac{\epsilon}{2}\sin(l+\lambda)-\frac{\epsilon}{6}\sin(3l-\lambda)$, but by reason of the smallness of ϵ these terms are insensible, and are therefore neglected. Rejecting also the terms in the divisor of the coefficient which are multiplied by ϵ^2, and observing that $\cos l\sin l=\frac{1}{2}\sin 2l$, we obtain, finally,

$$\text{solar precession}=\frac{3\pi\mathrm{K}\cos \mathrm{I}}{\mathrm{T}v}(\mathrm{C}+l-\tfrac{1}{2}\sin 2l).$$

The first term of this expression, which depends upon $\mathrm{C}+l$, or on the sun's longitude, is the constant or uniform precession. Its amount in one year is found by supposing l to be increased by 2π, and is consequently $\dfrac{6\pi^2\mathrm{K}\cos \mathrm{I}}{\mathrm{T}v}$. The second is periodic, and being proportional to twice the sine of the sun's longitude, it runs through its changes in half a-year. It is usually regarded as a part of solar nutation, and called *the solar equation of the equinoxes in longitude.*

Prop. 5. To find the diminution of the obliquity of the ecliptic produced by the sun's attraction.

Referring to the last diagram, make AE=EB=90°, and let ED be perpendicular to AB the ecliptic, and meet A′CB′ in E′, then EE′ is the small change in the inclination in the time *dt*. In the triangle ECE′, we have sin EE′ = sin CE sin ECE′. But EE′ being very small, the arc may be taken for the sine, and therefore EE′= sin CE sin ECE′.

Now $\sin \mathrm{CE}=\cos \mathrm{AC}=\dfrac{\cos l}{\sin\theta}$; and it has been already seen that $\sin \mathrm{ECE'}=\mathrm{ACA'}=\dfrac{\phi}{v}=\dfrac{3\mathrm{S.K}}{r^3v}\sin\theta\cos\theta$; therefore $\mathrm{EE'}=\dfrac{3\mathrm{S.K}}{r^3v}\cos\theta\cos l$, or since $\cos\theta=\sin \mathrm{I}\sin l$, $\mathrm{EE'}=\dfrac{3\mathrm{S.K}}{r^3v}\sin \mathrm{I}\sin l\cos l$. Multiplying by *dt*, and making the same substitutions as in the last proposition, we have

$$\int\mathrm{EE'}dt=\frac{6\pi\mathrm{K}}{\mathrm{T}v(1-\epsilon^2)^{\frac{3}{2}}}\sin \mathrm{I}\int\sin l\cos l\{1+e\cos(l-\lambda)\}dl,$$

whence neglecting as before terms multiplied by ϵ, and integrating, there results

$$\int \text{EE}'dt = -\frac{3\pi\text{K}}{2\text{T}v}\sin \text{I} \cos 2l,$$

for the solar nutation in obliquity. This expression, depending on twice the cosine of the sun's longitude, runs through all its changes in half a year; but its greatest value amounts to scarcely half a second, and is consequently altogether insensible to observation.

Prop. 6. To investigate the precessional motion of the equinoxes produced by the moon. Let

$\text{M} =$ moon's mass,
$\text{E} =$ earth's mass,
$\text{I}' =$ inclination of moon's orbit to the equator,
$l' =$ moon's distance from the intersection of her orbit with the equator,
$r' =$ radius vector of the moon's orbit,
$a' =$ semitransverse axis of moon's orbit,
$\epsilon' =$ eccentricity of the lunar orbit,
$\text{T}' =$ sidereal time of revolution.

Then, by following exactly the same reasoning as was pursued in *prop*. 4, there results for the retrograde motion of the points in which the plane of the lunar orbit intersects the plane of the equator (corresponding to the solar precession in *prop*. 4.), the expression

$$\frac{3\text{M}.\text{K}\cos \text{I}'}{v}\int \frac{\sin^2 l'}{r'^3}\,dt.$$

Now, we have $dt = \frac{\text{T}'r'^2dl'}{2\pi a'^2\sqrt{1-\epsilon'^2}}$, and $r' = \frac{a'(1-\epsilon'^2)}{1+\epsilon'\cos(\lambda'-l')}$ therefore $\frac{dt}{r'^3} = \frac{\text{T}'\{1+\epsilon'\cos(\lambda'-l')\}\,dl'}{2\pi a'^3\,1-\epsilon'^2)^{\frac{3}{2}}}$. But in the present case $\text{T}' = \frac{2\pi a'^{\frac{3}{2}}}{\sqrt{(\text{E}+\text{M})}}$ (for the mass of the moon cannot be neglected in comparison of that of the earth, as the mass of the earth is neglected in comparison of that of the sun), hence $\frac{1}{a'^3} = \frac{4\pi^2}{\text{T}'^2(\text{E}+\text{M})}$. The above expression therefore becomes

$$\frac{6\pi\text{M}.\text{K}\cos \text{I}'}{\text{T}'v(\text{E}+\text{M})(1-\epsilon'^2)^{\frac{3}{2}}}\int \sin^2 l'\{1+\epsilon'\cos(x-l')dl',\},$$

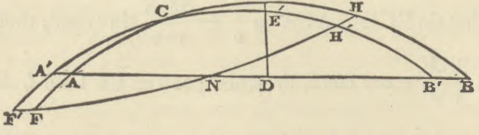
the integral of which (rejecting, as before, terms multiplied by ϵ') gives

$$\frac{3\pi\text{M}.\text{K}\cos \text{I}'}{\text{T}'v(\text{E}+\text{M})}(\text{C}+l'-\tfrac{1}{2}\sin 2l').$$

for the regression of the equator on the plane of the lunar orbit. Suppose l' to be increased by 2π, or a whole circumference, the regression caused by the moon's action in a sidereal revolution becomes $\frac{6\pi^2\text{M}.\text{K}\cos \text{I}'}{\text{T}'v(\text{E}+\text{M})}$.

It is now necessary to reduce this retrograde motion to the plane of the ecliptic.

Let AB be the ecliptic, ACB the equator, A′CB′ the new position of the equator, and FH the plane of the lunar orbit intersecting the new equator in F′ and H′, and the ecliptic in N. The mean effect of the moon's action in the course of a month, if the earth had no motion of rotation, would be to bring the equator nearer the plane of the lunar orbit, causing it to revolve about the line of its intersection with the lunar orbit; therefore by *Theorem* I., the momentary axis of rotation lies in the plane passing through that line and the pole of the equator, and the equator is consequently twisted about the equatorial diameter which is perpendicular to the intersection of the equator and lunar orbit. Hence, $\text{FC}=\text{CH}$ and $\text{F}'\text{C}=\text{CH}'$; and since $\text{FC}+\text{CH}=180°$, therefore FC and F′C are quadrantal arcs, and the two triangles CFF and CHH′ are in all respects equal. Now



$$\sin \text{FC} : \text{CF}'\text{F} :: \sin \text{FF}' :: \text{ACA}',$$

that is, $$1 : \sin \text{I}' :: \text{FF}' :: \text{ACA}',$$

and $$\sin \text{CA}'\text{A} : \sin \text{AC} :: \sin \text{ACA}' :: \sin \text{AA}',$$

that is, $$\sin \text{I} : \cos \text{AF} :: \text{ACA}' :: \text{AA}',$$

therefore,

$$\sin \text{I} : \sin \text{I}'\cos \text{AF} :: \text{FF}' : \text{AA}',$$

and consequently,

$$\text{AA}' = \frac{\text{F}'\text{F}\sin \text{I}'\cos \text{AF}}{\sin \text{I}}.$$

But AA′ represents the velocity along the ecliptic, and FF′ the velocity along the plane of the moon's orbit, and we have seen that the motion along this plane is $\frac{6\pi^2\text{K}.\text{M}\cos \text{I}'}{\text{T}'v(\text{E}+\text{M})}$, in the time T′, or a sidereal revolution. Dividing this by T′, we get the mean velocity in the plane of the orbit in the unit of time; whence $\text{FF}' = \frac{6\pi^2\text{K}.\text{M}\cos \text{I}'}{\text{T}'^2v(\text{E}+\text{M})}$.

For the sake of brevity let $\text{Q} = \frac{\pi^2\text{K}.\text{M}}{\text{T}'^2v(\text{E}+\text{M})}$, then $\text{FF}' = \text{Q}\cos \text{I}'$, and we have

$$\text{AA}' = \frac{\text{Q}\cos \text{I}'\sin \text{I}'\cos \text{AF}}{\sin \text{I}}.$$

We must now express cos I′ sin I′ cos AF, in terms of the obliquity and inclination of the lunar orbit to the ecliptic. Let $i = \text{ANF} =$ inclination of moon's orbit to the ecliptic, $n = \text{NA}$, the longitude of the node; then in the triangle ANF, we have by spherical trigonometry,

$$\cos \text{ANF} = \cos \text{NAF}\cos \text{NFA} + \sin \text{NAF}\sin \text{NFA}\cos \text{AF},$$

that is, since $\text{NAF}=\text{I}$, $\text{NFA}=\text{I}'$,

$$\cos i = \cos \text{I}\cos \text{I}' + \sin \text{I}\sin \text{I}'\cos \text{AF},$$

In like manner, in the same triangle,

$$\cos \text{I}' = \cos \text{I}\cos i + \sin \text{I}\sin i\cos n.$$

From these two equations we obtain this other,

$$\begin{aligned}\cos \text{I}'\sin \text{I}'\cos \text{AF} = {} & \cos \text{I}\sin \text{I}\cos^2 i \\ & -(\cos^2 \text{I}-\sin^2 \text{I})\cos i\sin i\cos n \\ & -\cos \text{I}\sin \text{I}\sin^2 i\cos^2 n,\end{aligned}$$

which, on substituting in it $\cos 2\text{I}$ for $\cos^2 \text{I}-\sin^2 \text{I}$, $\frac{1}{2}\sin 2i$ for $\cos i\sin i$, and $\frac{1}{2}+\frac{1}{2}\cos 2n$ for $\cos^2 n$, becomes

$$\begin{aligned}\cos \text{I}'\sin \text{I}'\cos \text{AF} = {} & \cos \text{I}\sin \text{I}(\cos^2 i-\tfrac{1}{2}\sin^2 i) \\ & -\tfrac{1}{2}\cos 2\text{I}\sin 2i\cos n \\ & -\tfrac{1}{2}\cos \text{I}\sin \text{I}\sin^2 i\cos 2n.\end{aligned}$$

Assuming i (the inclination of the moon's orbit) to be constant, which may be done in the present case without sensible error, the only variable in this expression is n, (the longitude of the node), which, on the supposition of i constant, is proportional to the time. Let τ denote the time of a revolution of the node, then for any time t, we have $n = \frac{2\pi t}{\tau}$. On making this substitution in the last equation, we obtain by means of it

$$\begin{aligned}\text{AA}' = \text{Q}\Big\{ & \cos \text{I}(\cos^2 i-\tfrac{1}{2}\sin\ i) \\ & -\frac{\frac{1}{2}\cos 2\text{I}}{\sin \text{I}}\sin 2i\cos\frac{2\pi t}{\tau} \\ & -\tfrac{1}{2}\cos \text{I}\sin^2 i\cos\frac{4\pi t}{\tau}\Big\}\end{aligned}$$

Now, if we assume $y =$ the regression of the equinoctial points on the ecliptic caused by the lunar action, and sup-

Precession of the Equinoxes.

pose y a function of t, then $AA' = \frac{dy}{dt}$, and the amount of this regression in a given time $= \int \frac{dy}{dt}\,dt$. Multiplying therefore the right hand side of the last equation by dt, and integrating, $\left(\text{observing that} \int \cos \frac{2\pi t}{\tau}\,dt = \frac{\tau}{2\pi} \sin \frac{2\pi t}{\tau}\right.$, and $\left.\int \cos \frac{4\pi t}{\tau}\,dt = \frac{\tau}{4\pi} \sin \frac{4\pi t}{\tau}\right)$, we obtain, finally, for the regression of the equinoctial points, or the precessional motion of the equinoxes, produced by the moon in the time t,

$$Q \left\{ \cos I\,(\cos^2 i - \tfrac{1}{2} \sin^2 i)\,t - \frac{\tau}{4\pi} \frac{\cos 2I \sin 2i}{\sin I} \sin \frac{2\pi t}{\tau} - \frac{\tau}{8\pi} \cos I \sin^2 i \sin \frac{4\pi t}{\tau} \right\} + \text{const.}$$

The first term of this expression increases uniformly with the time, and is called the *lunar precession*. The second term, being multiplied by $\sin \frac{2\pi t}{\tau}$, is periodic, and depends on the mean longitude of the moon's ascending node. It is called the *lunar equation of the equinoxes in longitude*. The third term is also periodic, but its numerical value is so small as to be insensible, and it is therefore omitted in the calculation. The lunar precession in a sidereal year is found by substituting T for t in the first term, and we have, therefore,

$$\text{lunar annual precession} = Q \cos I\,(\cos^2 i - \tfrac{1}{2} \sin^2 i)\,T.$$

Prop. 7. To find the diminution in the inclination of the equator to the ecliptic produced by the moon's action.

Let AB be bisected in D, and let DE be an arc perpendicular to AB, and meeting A′B′ in E′; then the alteration of obliquity produced by the moon in the time dt is represented by EE′. Now in the triangle CFF′ we have

$$\sin CF' : \sin CFF' :: \sin FF' : \sin FCF',$$

that is, $1 : \sin I' :: FF' : FCF'$;

and in the triangle CEE′,

$$\sin CE'E : \sin CE :: \sin ECE' : \sin EE'$$

that is, by reason of CE=AF (since FC=AE=90°) and ECE′=FCF′

$$1 : \sin AF :: FCF' : EE';$$

whence $EE' = FF' \sin I' \sin AF$. Now it was shewn in the last proposition that $FF' = Q \cos I'$, therefore

$$EE' = Q \cos I' \sin I' \sin AF.$$

To refer this to the ecliptic we have in the triangle NAF,

$$\sin NFA : \sin ANF :: \sin AN : \sin AF$$

which gives the equation

$$\sin I' \sin AF = \sin i \sin n;$$

and, as before we have

$$\cos I' = \cos I \cos i + \sin I \sin i \cos n;$$

whence multiplying the two equations together, and substituting $\frac{1}{2} \sin 2i$ for $\cos i \sin i$, and $\frac{1}{2} \sin 2n$ for $\cos n \sin n$, we get

$$\cos I' \sin I' \sin AF = \tfrac{1}{2} \cos I \sin 2i \sin n + \tfrac{1}{2} \sin I \sin^2 i \sin 2n,$$

and, consequently, writing for n its value $\frac{2\pi t}{\tau}$,

$$EE' = Q \left\{ \tfrac{1}{2} \cos I \sin 2i \sin \frac{2\pi t}{\tau} + \tfrac{1}{2} \sin I \sin^2 i \sin \frac{4\pi t}{\tau} \right\}.$$

Multiplying this by dt and integrating, we obtain for the diminution of the inclination, or *lunar nutation in obliquity*

$$-Q \left(\frac{\tau}{4\pi} \cos I \sin 2i \cos \frac{2\pi t}{\tau} + \frac{\tau}{8\pi} \sin I \sin^2 i \cos \frac{4\pi t}{\tau} \right).$$

Both terms of this expression are periodic; but the second is omitted in the calculation, as being too small to be sensible. Hence we have

Precession of the Equinoxes.

$$\text{lunar nutation in obliquity} = -Q \cdot \frac{\tau}{4\pi} \cos I \sin 2i \cos \frac{2\pi t}{\tau}.$$

Prop. 8. To compute the numerical value of the annual precession.

By prop. 4. the solar precession in one year $= \frac{6\pi^2 K \cos I}{Tv}$. Now Tv is the angle which any point of the earth describes about its axis of rotation in a sidereal year, or 366·26 days, and consequently $= 2\pi \times 366{\cdot}26$. The solar precession therefore becomes $\frac{3\pi K \cos (23^\circ\,28')}{366{\cdot}26}$ expressed in parts of the radius. To reduce it to seconds, we have, assuming radius $=1$, $\pi = 180^\circ = 180 \times 60 \times 60 = 648000$ seconds. Substituting this for π, and computing the above expression by the logarithmic tables we get

$$\text{solar annual precession} = K \times 4869''.$$

By prop. 6, the lunar precession in a sidereal year (on substituting for Q its value) is $\frac{6\pi^2 K \cdot M}{T'^2 v(E+M)} \cos I\,(\cos^2 i - \frac{1}{2} \sin^2 i)\,T$. But $T'v$ is the angle described by the diurnal rotation of the earth in one sidereal revolution of the moon, or 27·32 days (Astronomy, vol. iv.), and therefore $= 2\tau \times 27{\cdot}32$. We have also $i = 5^\circ\,8'\,47''{\cdot}9$, and, as before, $T = 366{\cdot}26$ days. Now assuming the moon's mass = 1-70th of the earth's mass, $M \div (E+M) = \frac{1}{71}$. By the substitution of these numbers, the lunar annual precession becomes

$$\frac{3\pi \cdot K \times 366{\cdot}26 \times \cos (23^\circ\,28') \times \{1 - \frac{3}{2} \sin^2 (5^\circ\,8'\,50'')\}}{27{\cdot}32 \times 27{\cdot}32 \times 71},$$

the calculation of which, reduced to seconds as before, gives

$$\text{lunar annual precession} = K \times 12176''.$$

Adding this to the solar annual precession, we obtain the effect produced by the joint action of the sun and moon, or

$$\text{luni-solar annual precession} = K \times 17045''.$$

It is now necessary to assign a value to the quantity K which depends on the law of the density of the earth. Supposing the earth homogeneous, we have $K = \frac{a^2 - b^2}{a^2 + b^2} = \frac{e}{1-e}$, e being the elipticity $= \frac{1}{301}$, (Figure of the Earth,)

whence $K = \frac{1}{300}$. This value of K gives

$$\text{luni-solar annual precession} = \frac{17045''}{300} = 56''{\cdot}82.$$

The observed quantity is only 50″·4; the difference being occasioned chiefly by the erroneous assumption of the homogeneity of the earth. If the earth be denser towards the centre, (and it is known to be so from other phenomena), the momentum of the protuberant parts will not be so great as if it were equally dense with the interior parts, and the precession will be less. From Cavendish's experiment, and experiments on the attraction of mountains, it has been ascertained that the mean density of the whole earth is about five times greater than that of water, and twice as great as that of the solid substances composing its exterior crust. But we are entirely ignorant of the law according to which the density varies from the surface towards the centre; and an infinity of hypotheses may be made which would give the observed precession, and at the same time satisfy the condition of a superficial density equal to half the mean density.

Prop. 9. To compute the numerical value of the solar and lunar nutation.

The solar nutation consists of two parts. The first is the solar equation of the equinoxes in longitude, or the second term of the expression for the solar precession in prop. 4, Precession of the Equinoxes.

Precession of the Equinoxes.

its value is $\frac{3\pi K}{Tv}\cos I\times\frac{1}{2}\sin 2l$. Substituting $2\pi\times 366{\cdot}26$ for Tv, and multiplying by $\frac{180\times 60\times 60}{\pi}$ to reduce to seconds, the computation gives

$$\text{1st part of solar nutation} = K\times 387''{\cdot}5\times\sin 2l.$$

The second part is the nutation in obliquity, found by prop. 5, the value of which is $\frac{3\pi K}{Tv}\sin I\times\frac{1}{2}\cos 2l$. This being computed in the same manner as the last gives

$$\text{2d part of solar nutation} = K\times 168''{\cdot}3\times\cos 2l.$$

Assuming the earth to be homogeneous, and consequently $K=\frac{1}{300}$, we have for the sum of the two parts

$$\text{solar nutation} = 1''{\cdot}29\sin 2l + 0''{\cdot}56\cos 2l,$$

both terms being so small as to be insensible to observation.

The lunar nutation is also composed of two parts; the first being the lunar equation of the equinoxes in longitude, or the second term of the expression in prop. 6; and the second the nutation in obliquity found in prop. 7. By prop. 6, the first of these parts is

$$\frac{3\pi K.M.\tau}{2T'^2v(E+M)}\cdot\frac{\cos 2I\sin 2i}{\sin I}\sin\frac{2\pi t}{\tau},$$

which, since $\tau=18{\cdot}6\times 366{\cdot}26$ days, becomes, on substituting for the different quantities their numerical values, and reducing to seconds,

$$K\times\frac{3\times 64800\times 18{\cdot}6\times 366{\cdot}26\times\cos(46^\circ 56)\sin(10^\circ 17'36)}{2\pi\times(27{\cdot}32)^2\times 2\times 71\sin(23^\circ 28)}\sin\frac{2\pi t}{\tau},$$

whence there is found from computation,

$$\text{lunar nutation in longitude} = K\times 6093''\times\sin\frac{2\pi t}{\tau}.$$

By prop. 7. the lunar nutation in obliquity becomes, on substituting for Q its value, and neglecting the sign,

$$\frac{3\pi K.M.\tau}{2T'^2v(E+M)}\cdot\cos I\times\sin 2i\times\cos\frac{2\pi t}{\tau}.$$

Comparing the coefficient of $\cos\frac{2\pi t}{\tau}$ in this expression with that of $\sin\frac{2\pi t}{\tau}$ in the above, it is obvious that the latter is found by multiplying the former by $\frac{\cos I\sin I}{\cos 2I}=\frac{\sin 2I}{2\cos 2I}$ $=\frac{1}{2}\tan 2I=\frac{1}{2}\tan(46^\circ 56')$. The multiplication gives

$$\text{lunar nutation in obliquity} = K\times 3260''\cos\frac{2\pi t}{\tau}.$$

Assuming that the earth is homogeneous, and consequently $K=\frac{1}{300}$, these two parts added together give

$$\text{lunar nutation} = 20''{\cdot}31\sin\frac{2\pi t}{\tau} + 10''{\cdot}88\cos\frac{2\pi t}{\tau}.$$

The observed values of the coefficients are 18″·36 and 9″·239, the differences between the observed and computed values, as in the case of the precession, arising from the assumption of the uniform density of the earth.

Prop. 10. To determine the motion of the pole of the earth's axis of rotation.

As the inclination of the equator to the ecliptic undergoes no permanent alteration in consequence of the action of the sun and moon, and as the precessional motion of the equinoxes is proportional to the time, it follows that, abstracting the effects of lunar and solar nutation, the pole of the equator must describe a circle about the pole of the ecliptic, the plane of which is parallel to the ecliptic, and of which the radius is equal to the sine of the obliquity, or = sin (23° 28′). The mean velocity corresponding to the regression of the equinoctial points, is 50″.4 in a year, and consequently the period of a revolution is about 25900 years. Now in order to take account of the lunar nutation (the solar, as has already been remarked, is scarcely sensible), it is only necessary to remark that the absolute velocity of the pole in its small circle, is to the velocity with which the equinoctial points regress in the ecliptic, as the radius of the small circle to the radius of the ecliptic, or as sin I : 1. Hence the motion of the pole in the plane of the small circle, is obtained by multiplying the expression in prop. 6, by sin I; and therefore the correction to be applied to the uniform motion of the pole, is the second term of that expression, multiplied by sin I, or sin I × lunar equation of the equinoxes in longitude. But by prop. 9, this term $=K\times 6093''\sin\frac{2\pi t}{\tau}$, therefore the corresponding motion of the pole =

$$K\times 6093''\sin(23^\circ 28')\sin\frac{2\pi t}{\tau}=K\times 2427''\sin\frac{2\pi t}{\tau}.$$

With respect to the second part of the nutation, it is obvious that any change of obliquity produces an equal change in the place of the pole on the meridian, and therefore, by the last proposition, the motion of the pole in this direction is $K\times 3260''\cos\frac{2\pi t}{\tau}$. Now let $K\times 2427''=a$, and $K\times 3260''=b$, and let the motion of the pole in the two directions be respectively denoted by x and y, we have then $x=a\sin\frac{2\pi t}{\tau}$, $y=b\cos\frac{2\pi t}{\tau}$; and consequently the equation

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1;$$

which is the equation to an ellipse, and shews that the pole describes a small ellipse about its mean place in the course of a revolution of the nodes, as was discovered by Bradley from observation.

Prop. 11. From the observed values of the precession and nutation, to determine the ratio of the moon's mass to the mass of the earth.

The quantities most accurately determined from observation, from which the moon's mass can be found, are the whole annual precession p (=50″·4), and the coefficient of the lunar nutation in obliquity q (=9″·239). Let s = the solar annual precession, and m = the lunar annual precession, then $s=p-m$. Now, by prop. 7, $q=Q\frac{\tau}{4\pi}\cos I\sin 2i$, and, by prop. 6, $m=Q\cos I(\cos^2 i-\frac{1}{2}\sin^2 i)T$, whence by eliminating Q cos I, we get

$$m=\frac{q.4\pi.T(\cos^2 i-\frac{1}{2}\sin^2 i)}{\tau\sin 2i},$$

and on computing m from the values of T, τ and i above given, we find $m=q\times 3''{\cdot}735=34''{\cdot}51$; therefore, also, $s=p-m=15''{\cdot}89$.

Again, from prop. 4, we have $s=\frac{6\pi^2.K\cos I}{Tv}$, and from prop. 6, (on substituting for Q its value), $m=\frac{6\pi^2.K.M\cos I}{T'^2v(E+M)}$ $(\cos^2 i-\frac{1}{2}\sin^2 i)T$; whence

$$\frac{s}{m}=\frac{T'^2}{T^2(\cos^2 i-\frac{1}{2}\sin^2 i)}\cdot\frac{E+M}{M}.$$

By computing the coefficient of $(E+M)\div M$, and by means of the values s and m now found, this equation gives

$$\frac{E+M}{M}=81{\cdot}755,$$

whence it follows that the mass of the moon is to the mass of the earth in the ratio of 1 to 80·755.

The phenomena of the precession and nutation, and those of the tides, are the only astronomical facts which enable us to determine the moon's mass. From a long series of observations on the tides at the harbour of Brest, Laplace found the ratio of the masses of the moon and earth to be 1 : 75·77.

The regression of the equinoctial points amongst the fixed stars, and consequent precession of the equinoxes, being a motion which, though extremely slow (amounting only to a degree in about seventy-two years), increases constantly with the time, was detected at an early period in the history of astronomy, and its rate was determined with considerable accuracy by Hipparchus. Its physical cause was of course not suspected until after the discovery of gravitation; but Newton himself, by a process of reasoning, which, although not quite accurate, affords some of the most remarkable instances of his extraordinary sagacity (*Principia*, lib. iii., prop. 39), showed it to be a necessary consequence of the flattened form of the earth. D'Alembert was the first who gave a general and accurate solution of the problem, in his *Recherches sur la Précession des Equinoxes* (1749); and Euler also treated the subject in the *Berlin Memoirs* for the same year. Various solutions of the problem have since been given, amongst which may be mentioned those of Sylvabella and Walmesley in the *Philosophical Transactions* (vols. xlviii. and xlix.); that of Simson (*Miscellaneous Tracts*, 1751); that of Frisi in his *Theoria Geometrica Diurni Motûs* (*Opera*, tom. iii.); that of Lagrange in his *Memoir on the Libration of the Moon*, which obtained the prize of the Academy of Sciences of Paris for 1769; that of Landen (*Mathematical Memoirs*, 1780); and that of Vince (*Philosophical Transactions*, 1787). Of these solutions, that of Frisi deserves to be noticed as perhaps the most perspicuous and elegant. An excellent elementary demonstration is given by Mr Airy, the present astronomer-royal, in his *Mathematical Tracts* (1826 and 1831), of which we have freely availed ourselves in the present article; but for a complete investigation of the question in all its generality, we must refer the reader to the *Mécanique Céleste*, and still more particularly to a Memoir of Poisson, "Sur le Mouvement de la Terre autour de son Centre de Gravité," in the *Mémoires de l'Académie Royale des Sciences*, tome vii., 1829.

The nutation, as has already been remarked (see also Astronomy, vol. iv., p. 13), was detected by Bradley, from a comparison of observations which were undertaken with a view to determine the parallax of the fixed stars. Bradley assigned to the co-efficient or constant of nutation the value 9″, which till a late period was adopted by most astronomers. Laplace computed its value from theory to be 9″·63; but as this result could only be obtained by having recourse to hypotheses respecting the ellipticity and density of the earth, and also the mass of the moon, which may possibly differ considerably from the truth, it cannot be regarded as of much weight. There are, however, three other determinations of the constant (besides that of Bradley), from observation, which may be supposed to give its value with all the precision that is capable of being attained. The first is that of Von Lindenau, from about 800 observations of Polaris made between the years 1750 and 1815, and consequently including three revolutions of the moon's node; as well as from those made by Bradley, Maskelyne, Bessel, Carlini, Piazzi, and Von Lindenau himself. From these observations he found the value of the constant of nutation to be 8″·97718. The second determination is that of Dr Brinkley (*Philosophical Transactions*, 1821), deduced from his own observations with the Dublin Mural Circle; and the value which he found was 9″·25. The third determination, and that which has the greatest probability in its favour, is a very recent one by Dr Robinson of Armagh, undertaken at the instance of the British Association. It is deduced from 11,000 observations made at Greenwich with the mural circle, between the years 1812 and 1834, and embraces more than a complete revolution of the node. The result gives the constant of nutation = 9″·23913. (See the *Monthly Notices* of the Royal Astronomical Society for May 1838.) (T. G.)

Since the above was written M. Poinsot, member of the Institute of France, has proved (1858) from mathematical calculations, founded on his theory of couples, that by the law of gravitation, the earth's axis must describe an oscillation of 1·08 seconds in virtue of the attraction of the sun, and 16·9 seconds in virtue of that of the moon, or about 18 seconds in all in the course of nine years and three months, after which a similar oscillation takes place in a contrary direction. This quantity of 18 seconds all but exactly coincides with the results of observation; and his determination of the precession is equally exact, since he finds it to be 50·4 seconds. He has likewise proved that the precession would be the same if the earth, instead of being a solid spheroid, were hollow, or if its mass or volume were changed, provided its momentum of inertia remained the same.

PRECIOUS METALS.

Precious Metals, a designation given to gold and silver. These, though not the most useful of the metals, having been converted into coin and used from a remote period to perform the functions of money, have in consequence been generally regarded as of peculiar importance, and dignified with the epithet "precious."

The reader will find in the articles Gold and Silver in this work descriptive notices of these metals; and the mode in which they are obtained is explained in the article Mining. In this article we mean to confine ourselves to an inquiry into the magnitude of their supply, their consumption, and their probable future value in exchange. And as these metals serve as standards by which to measure the values of other things, and as the equivalents for which they are most commonly exchanged, it is plain that these inquiries involve considerations of the highest importance, and which deeply affect the interests of all classes. Unluckily, however, the difficulty of such investigations is at least as great as their importance. They are not, in truth, of a kind to afford any certain conclusions, and we must be contented with those that seem to present on the whole the greatest amount of probability.

Jacob,[1] and others who have engaged in inquiries relative to this subject, have carried their researches to a very remote epoch, and have tried to amuse their readers with estimates of the quantities of gold and silver in existence at different epochs, such as the commencement of the Christian æra, the year 1492, when America was discovered, and so forth. But though these estimates, and the researches which serve as their basis, may illustrate the learning and industry of their authors, no reliance can be safely placed on their accuracy. Even at present, when most matters that have reference to currency and commerce are the objects of study and research, and many of them are embodied in official returns, the difficulties in the way of accurate investigation are often all but insuperable. And

---

[1] The author of an *Historical Inquiry into the Production and Consumption of the Precious Metals*, 8vo, 2 vols., London, 1831.

Supply of Precious Metals.

when such is now the case, what must be the chance of our coming to anything like correct conclusions in regard to the like subjects at remote periods, when these inquiries were almost entirely neglected, and when, in the lapse of ages, the few records that might have originally existed have either been much mutilated or wholly destroyed? The truth is, that the estimates of the amount of the precious metals extant in the world at the epochs referred to, are not worth the ink with which they are written. They may chance not to be wide of the mark, but there are no means of judging whether such is or is not the case. The investigations which they involve are buried in an obscurity which most likely will never be dispelled.

Dismissing, therefore, such unfruitful inquiries, we shall not in this article carry our researches farther back than the discovery of America, and shall principally confine ourselves to a consideration of the events of the last twelve or twenty years. Those, indeed, that belong to previous periods are principally interesting as they may serve to throw light on the latter.

Part I.—*Supply of the Precious Metals.*

Supply of precious metals.

Since the discovery of America, by far the greatest supplies of gold and silver have been derived from that continent. Previously to the publication of Humboldt's *Essai Politique sur la Nouvelle Espagne*, several estimates, some of which were framed by individuals of great intelligence, had been given of the quantities of gold and silver imported from America. They, however, differed widely from each other, and were all deduced from comparatively limited sources of information. When brought together, they exhibit the following results:—

Estimates of the Imports of the Precious Metals from America into Europe since 1492.

Authorities.	Periods.	Total Estimated Influx.	Annual Estimated Influx.
		Dollars.	Dollars.
Ustariz	1492–1724	3,536,000,000	15,241,379
Solorzano	1492–1628	1,500,000,000	11,029,411
Moncada	1492–1595	2,000,000,000	19,417,475
Navarete	1519–1617	1,536,000,000	15,673,469
Raynal	1492–1780	5,154,000,000	17,895,833
Robertson	1492–1775	8,800,000,000	31,095,406
Necker	1763–1777	304,000,000	21,714,285
Gerboux	1724–1800	1,600,000,000	21,052,631
The Author of *Recherches sur le Commerce*, Amst. 1776	1492–1775	5,072,000,000	17,922,261

Of these estimates, that which bears the name of Robertson is very greatly in excess of the others, and is certainly the widest of the mark. But in looking into the work of that judicious and excellent historian, he hardly seems to be responsible for the computation. It is, in truth, the estimate of the Spanish authorities to which he refers, and is not founded upon any investigations or inquiries of his own. (*History of America*, iii., p. 389, ed. 1778.)

Estimates of Humboldt.

But all previous estimates have been wholly superseded by those founded on the more extensive and laborious investigations of Humboldt. Besides being acquainted with all that had been written on the subject, and having ready access to sources of information unknown to the writers already alluded to, this illustrious traveller was well versed in the theory and practice of mining, and critically examined several of the most celebrated mines. He was therefore incomparably better qualified for forming correct conclusions as to the past and present productiveness of the mines than any of those who had previously speculated on the subject. His statements have indeed been accused of exaggeration, and there seem to be good grounds for believing that this charge is in some measure well founded, particularly as respects the accounts of the profits made by mining, and of the extent to which the supplies of the precious metals may be increased. But this criticism applies, if at all, in a very inferior degree to the accounts Humboldt has given of the total produce of the mines, and the exports to Europe. And making every allowance for the imperfection inseparable from such investigations, it is still true that the statements in question, and the inquiries on which they are founded, are among the most valuable contributions that have been made to statistical science.

According to Humboldt, the annual average supplies of the precious metals derived from America have been as follows:—

	Dollars a Year at an Average.		Dollars a Year at an Average.
From 1492 to 1500	250,000	From 1600 to 1700	16,000,000
„ 1500 to 1545	3,000,000	„ 1700 to 1750	25,500,000
„ 1545 to 1600	11,000,000	„ 1750 to 1803	35,300,000

(*Essai sur la Nouvelle Espagne*, iii. 428, 2d ed.) The following is Humboldt's estimate of the annual produce of the mines of the New World at the beginning of the present century:—

Annual Produce of the Mines of America at the Commencement of the Nineteenth Century.

Political Divisions.	Gold.		Silver.		Value of the Gold and Silver, in Dollars.
	Marcs of Castile.	Kilogs.	Marcs of Castile.	Kilogs.	
Viceroyalty of New Spain	7,000	1,609	2,338,220	537,512	23,000,000
Viceroyalty of Peru	3,400	782	611,090	140,470	6,240,000
Captain-Generalship of Chili	12,212	2,807	29,700	6,827	2,060,000
Viceroyalty of Buenos Ayres	2,200	506	481,830	110,764	4,850,000
Viceroyalty of New Granada	20,505	4,714	...	...	2,990,000
Brazil	29,900	6,573	...	...	4,360,000
Total	75,217	17,291	3,460,840	795,581	43,500,000

Taking the dollar at 4s. 6d., this would give L.9,666,000 for the total annual produce of the American mines. Humboldt further estimated the annual produce of the European mines of Hungary, Saxony, &c., and those of Northern Asia, at the same period, at about L.1,000,000 more; making, in round numbers, their entire production nearly L.11,000,000.

The quantity of gold produced in America at the beginning of the century was to the quantity of silver as 1 to 46; in Europe the proportions were as 1 to 40. The value of equal quantities of gold and silver were then in the proportion of 15 or 15½ to 1.

Estimates of Jacob.

From 1800 to 1809 the yield of the American mines continued to increase, and their produce, and that of the European and Russian mines, was then probably rather above than below L.12,500,000. But in the last-mentioned year the contest began, which terminated in the dissolution of the connection between Spain and her American colonies. The convulsions and insecurity arising out of this struggle, the proscription of the old Spanish families, to whom the mines principally belonged, who repaired with the wrecks of their fortunes, some to Cuba, some to Spain, and some to Bordeaux and the south of France, caused the abandonment of several of the mines, and an extraordinary falling off in the amount of their produce. There are no means of estimating the precise extent of this decline; but, according to Jacob, who collected and compared the existing information on the subject, the total average produce of the American mines, inclusive of Brazil, during the twenty years ending with 1829, may be estimated at L.4,036,838 a year, being less than half their produce at the beginning of the century! (Jacob, i. 267.)

It has, however, been supposed that Jacob rather exaggerated the falling off. And, at all events, the supplies of bullion obtained from Mexico and South America began soon after the publication of his work (1831) to increase; and notwithstanding the anarchy to which they have continued to be a prey, that increase has been maintained down to the present time (1858).

It appears, from the returns sent home by the British consuls, that the coinage of gold and silver in the Mexican mints amounted in 1847 to 16,923,948 dols., and in 1848 to 19,506,754 dols. But it is well known that considerable quantities of these metals are raised and exported from Mexico without being brought to the mints to be coined. And, taking this item into account, we shall not perhaps be very wide of the mark if we estimate the entire produce of the Mexican mines in 1847 and 1848 at about 19,000,000 and 21,500,000 dols., of which from 17,000,000 to 20,500,000 dols. were in silver.

Supplies of gold and silver in 1857 and 1858 in America.

The discovery of new mines, and the greater cheapness and more abundant supplies of quicksilver obtained from California, have conspired to increase the produce of the Mexican mines during the last half-dozen years. And though these circumstances have been to a considerable extent countervailed by the unsettled state of public affairs, and the greater insecurity that has prevailed during the period referred to, yet, on the whole, it appears to be pretty well established that there has been a material increase.

In 1850 the produce of the Peruvian mines was estimated at about 6,000,000 dols., and it is not supposed to have varied much in the interval.

The produce of the Bolivian mines is usually estimated at about a third part of the produce of those of Peru.

In 1857 the value of the gold and silver in coin, bars, and ore exported from Chili amounted, according to the custom-house returns, to 4,185,284 dols.; and we are assured that we shall not be far wrong if we estimate the total produce of the Chilian mines at about 5,000,000 dols.

The elaborate estimates of Birkmyre,[2] Chevallier (*Monnaie*, p. 228), and other authorities, in regard to the produce of the mines of Brazil, New Granada, and other parts

---

[1] Birkmyre's estimate of the production of the precious metals in 1846 and 1850, the most elaborate and valuable of any hitherto published, appeared in the *Times* of the 19th May 1851. We subjoin some of its principal portions:—

Comparative Table, showing the Annual Produce (approximate Calculation) in value of fine Gold and Silver for 1846 *and* 1850, *the first being Two Years before the Discovery of the rich deposits of Gold in California; the latter, Two Years after the Discovery.*

* Exclusive of China and Japan, which produce large quantities of gold and silver, the amount of which is quite unknown to Europeans.

"The quantities of gold and silver produced at the under-mentioned epochs were:—In 1801, the quantity of pure gold produced in America was 46,331 lb.; in Europe and Northern Asia (exclusive of China and Japan), 4,916 lb.; total produce, 51,247 lb. = 55,910 lb. British standard gold = L.2,612,200. In 1846 the quantity of pure gold produced in America was 25,503 lb.; in Europe, Africa, and Asia (exclusive of China and Japan), 89,171 lb; total produce, 114,674 lb. = 125,108 lb. British standard gold = L.5,846,772. In 1850, the quantity of pure gold produced in America was 261,731 lb.; in Europe, Africa, and Asia (exclusive of China and Japan), 104,219 lb.; total produce, 365,950 lb. = 399,247 lb. British standard gold = L.18,654,322. The above quantities are probably less than the actual production. The duties on gold in Russia on the produce of the private mines are heavy, varying from 12 to 24 per cent.; in Austria they amount to 10 per cent., in Brazil to 5 per cent., and are understood to lead to a great deal of smuggling. In other countries, such as the United States, where there are no duties, the gold and silver stated in the table are only the quantities brought to the mints to be coined, there being no means of determining the quantity used in jewellery and other arts and manufactures."

of America, differ very widely; and there is, in truth, little besides conjecture on which to form an estimate. Probably, however, it may amount, excluding California, to about 4,000,000 dols. The above results, when brought together, give for the estimated produce of the American mines:—

	dollars.
Mexico	23,000,000
Peru	6,000,000
Bolivia	2,000,000
Chili	5,000,000
Other parts	4,000,000
Total	40,000,000

This sum is equivalent, at 4s. 6d. per dol., to nearly L.9,000,000; the value of the silver produced being from five to six times greater than that of the gold.

It is perhaps needless to observe that all investigations into matters of this sort are liable to be affected by so many sources of error that, even when they are most skilfully and cautiously conducted, their results are not always to be depended upon. But, speaking generally, we are disposed to think that the previous estimates are rather within than beyond the mark. It is worthy of remark that they do not differ much from Humboldt's estimate (43,500,000 dols.) of the produce of the American mines in the early part of the century.

In Russia.

Russian Mines.—Small supplies of the precious metals have been for a lengthened period obtained from Russia. But since 1830, and more especially since 1840, the produce of the Russian mines and washings, but principally the latter, has been rapidly and largely increased. Thus the produce of gold from the Siberian washings and the mines of the Ural, which amounted (according to the official returns) to 3875 kilog. in 1826, had increased in 1840 to 8736 kilog., and in 1847 to 27,362 kilog. Since then, however, the produce has rather fallen off; and during the three years ended with 1854, their average yield amounted to only 22,768 kilog. a year.[1] Formerly the value of the silver supplied by Russia greatly exceeded that of the gold; but since 1830 this has not been the case; for, while the produce of gold has been so very greatly increased, that of silver has varied but little (from 17,000 to 18,000 kilog. a year), so that the value of the former is now about twenty times that of the latter. The following table, extracted from the work of M. Otreschkoff, is founded on official returns, and gives a view of the production of the precious metals in Russia down to 1855:—

Account of the Quantity and Value of the Precious Metals produced in Russia from 1810 *to* 1855.

Years.	Gold.		Silver.		Annual Average of Total Prod.
	Kilog.	Francs.	Kilog.	Francs.	Francs.
1810 to 1825...	16,485	54,830,448	189,189	42,067,480	6,459,856
1825 „ 1848...	231,543	772,445,780	443,262	98,563,008	37,869,948
1848 „ 1851...	75,547	252,034,380	53,959	11,998,348	88,000,908
1851 „ 1855...	92,085	307,206,156	68,426	15,215,200	80,605,339
Totals......	415,610	1,386,516,764	754,836	167,844,036	...

The Russian authorities have ascribed the falling off in the produce of the mines and washings since 1847 to the exhaustion of the deposits and the unskilfulness of those engaged in the business. But though this be most probably the case to some extent, it is believed that it has been in part also occasioned by the heavy taxes imposed on the gold raised by private parties. These vary in amount according to the productiveness of the mines and washings, from about 12 to 24 or 25 per cent., and are most oppressive.

While, however, it may be fairly assumed that these heavy duties have tended to lessen the produce of gold, there can be little doubt that their principal effect has been to defeat themselves by tempting the parties concerned to adopt every means for their evasion, which the notorious corruption of the revenue officers renders an easy matter. And in addition to the influence of these circumstances over the private mines, the depredations and carelessness of the parties employed to work the crown mines tells quite as much over their produce: so that we need not be surprised that it has been doubted whether from a third to a half, or more, of the gold furnished by the Russian mines and washings be not omitted in the official returns. But, taking the deficit at a fourth part only, and supposing the official produce of the washings and mines to amount at present (1858) to about 70,000,000 fr. a year, the real produce would be equal to 87,500,000 fr., or L.3,500,000 sterling. It is said that the Russian government intend to throw open the crown mines and washings to the public, and at the same time to make a large reduction in the duties on the produce obtained from the private mines. This would be sound policy; and if it be adopted, a considerable increase in the supplies of gold and silver may be anticipated.

In Europe.

Produce of Gold and Silver in other parts of Europe.—It might have been supposed that the late extraordinary influx of the precious metals from California and Australia would have given a serious check to their production in Europe; such, however, has not been the case, but on the contrary it has considerably increased within the last ten or twelve years.

Our readers are aware that lead ore always contains a greater or less quantity of silver; and when the value of the latter is sufficient to repay the expense, it is usual to extract it by means of the process of "refining." This process has latterly been much improved, and is now profitably applied to ores to which it was formerly unsuitable. And as silver in Europe is mostly obtained from lead, this has been a principal source of its late increase.

In 1845 some rich mines of argentiferous lead were discovered in the provinces of Murcia and Granada in Spain, not far from Alicant; the yield of silver from which, and the mines in other parts of the peninsula, is believed to amount to L.500,000 or L.600,000 a year. The produce of the Austrian and German gold and silver mines has also increased, and small quantities are furnished by Piedmont, France, and other parts of the Continent.

The reader may perhaps be surprised to learn that, in consequence principally of the improved process of refining already referred to, no fewer than 532,866 oz. of silver were obtained from lead in the United Kingdom in 1857, which, at 5s. an oz., was worth L.133,216, 10s.[2]

The total annual production of the precious metals in Europe, exclusive of Russia, may be roughly estimated to have amounted in 1857 and 1858 to L.1,500,000 or L.1,600,000 a year.

Total supply of gold and silver in 1857 from old sources.

On the whole, therefore, it may reasonably be concluded that the aggregate production of the precious metals (excluding the produce of the Californian and Australian gold fields) in America, Asiatic Russia, and Europe in 1857, or rather in each of the three years ending with 1857, amounted to about L.14,050,000, viz.:—

---

[1] Otreschkoff, *De l'Or et de l'Argent*, &c., i. 179. The author is a councillor of state in the service of the Czar.

[2] During the year 1857, 5190 tons argentiferous ores were imported, mostly from Chili, which produced 846,569 oz. of silver, worth, at 5s. an oz., L.211,642. This, however, is to be reckoned in the produce of Chili rather than of England. (Hunt's *Mining Records for* 1858, p. 30.

America	L.9,000,000
Asiatic Russia	3,500,000
Europe	1,550,000
Total	L.14,050,000

And deducting from this sum the total estimated produce of the same countries in 1809, when the American mines had attained the maximum of their productiveness previously to the revolutionary disturbances (L.12,500,000), there is an increase of L.1,550,000.

But though, compared with its former amount, this may appear to be a considerable increase, yet, if we compare it with the vast increase that has taken place since 1809 in the population, commerce, and wealth of Europe and America, it will at once be seen to be quite inconsiderable. We believe, indeed, that no small portion of the extraordinary progress that has taken place of late years has been owing to the impulse given to emigration, and to most sorts of industrial undertakings, by the discovery of the precious metals in California and Australia. But if we suppose that the advances we have witnessed might have been effected without this impulse, it is quite obvious that the increased supply of the precious metals from the old sources would not have sufficed to meet the additional demands for coin and for the bullion which is required in the arts. And though the greater scarcity and value of the precious metals would, under the supposed circumstances, have led to the employment of various substitutes in their stead, their increased price, as compared with the mass of ordinary products, would have been too manifest to escape general notice, and would have had a most injurious influence. But the fortunate discovery of the Californian and Australian gold-fields have prevented these results from being realized; and while there is no longer any fear of injury from a rise in the value of gold and silver, many evil results are anticipated from that fall in their value which is said to be imminent. Probably, however, this apprehension may also turn out to be ill-founded.

In addition to the supplies of the precious metals already specified, further quantities are supplied by China and other parts of Asia, Japan, the Eastern Archipelago, &c., and also by various parts of Africa. There is, however, no authentic information in regard to this produce; and excepting small supplies of gold dust brought from some parts of the African coast, the bullion of the countries referred to has but little influence in the markets of the civilized world. M. Otreschkoff estimates, or rather conjectures, that the produce of gold and silver in Asia (exclusive of Russia), the Eastern Archipelago, Oceanica, &c., amounted, at an average of the four years ending with 1854, to 114,527,820 fr. (L.4,581,000) a year, and that of Africa to 13,980,672 fr. (L.560,000) a year. (*De l'Or et de l'Argent*, &c., i. 287, 293.)

Supplies from California and Australia.

Supplies of Gold from California and Australia.—The gold in these regions is found in the debris of the quartz rocks in which it has been imbedded, and in the rocks themselves. In the former case it is found in the hollows to which it has been carried down by rains or streams, at different depths, sometimes in grains or *flakes*, and sometimes in lumps or *nuggets*, of varying but occasionally of very considerable magnitude. Gold may be sought or dug for (hence *diggings*) either by single or associated individuals; but when quartz rock is crushed to obtain gold, expensive machinery is usually employed, and the work is for the most part carried on by companies. The business of the diggings has very much of the character of a lottery, with many blanks and a few large prizes; but in the crushing of quartz the returns are less irregular, and the business partakes more of the character of an ordinary branch of industry.

The Californian deposits were discovered late in May or early in June 1848; and notwithstanding the remoteness of the country, and the fact of its being almost destitute of inhabitants, above 5000 persons were attracted to the spot by the end of the season, who are said to have realized above L.1,000,000 sterling. The news of the discovery and of the unexampled richness of the gold-fields having spread on all sides with electrical rapidity, occasioned an extraordinary influx of immigrants from most parts of the world into California. The supplies of gold attained to an unexampled magnitude; cities rose in the wilderness as if by enchantment; the great bay of San Francisco, which had hitherto been entirely deserted, was crowded with ships and steamers from the most distant countries; and California speedily became one of the states of the Union, and has now a large population.

But here, as elsewhere, we have to regret the want of accurate information in regard to the production of gold. It appears, however, from the custom-house returns that during the years 1856 and 1857, gold of the value of 51,142,269 and 49,340,186 dols. was shipped from San Francisco. And, in addition to these quantities, large amounts, of which no account is taken, are conveyed away by parties returning to Mexico, to the Eastern States, Europe, and China. Of these various estimates have been made. But the prevalent opinion in the best-informed quarters seems to be that, when they are included, and allowance is also made for the quantity retained at home, the total yield of gold in California in 1856 and 1857 may be moderately reckoned at from 60,000,000 to 65,000,000 dols., or from L.13,300,000 to L.14,400,000, or nearly L.14,000,000 at an average.

But vast as it certainly is, this production has been equalled and sometimes surpassed by that of Australia. The deposits in the latter were not discovered till 1851, and they were so very rich, and the influx of immigrants so extraordinary, that the gold-fields of Victoria only are estimated to have produced in 1852 no fewer than 4,247,152 oz.; which, at the then price of 70s. an oz., gives a gross amount of L.14,866,799. This, however, has been the *maximum* amount of production hitherto attained. In 1857 the same gold-fields furnished only 2,606,040 oz. According to the carefully-compiled and valuable returns of Mr Khull of Melbourne, the yield of gold in Victoria since 1852 has been as follows, viz.:—

Year.	Ascertained Ounces.	Unrecorded Ounces.	Total Ounces.	Price per Oz.	Value.
1852	3,159,322	1,088,325	4,247,152	70s.	L.14,866,799
1853	2,274,152	816,199	3,090,342	75	11,588,782
1854	1,831,434	361,264	2,192,699	80	8,770,796
1855	2,234,296	729,864	2,964,073	80	11,856,292
1856	2,530,383	1,003,144	3,533,527	80	14,134,108
1857	2,341,147	264,893	2,606,040	80	10,424,160

In addition to the gold obtained from Victoria, a supply which in 1852 amounted to nearly L.3,000,000 was obtained from the Sydney or New South Wales district. The produce from this source has, however, rapidly declined, and is now (1858) so inconsiderable as hardly to be worth notice.

Total supply of gold and silver in 1857.

It would therefore appear that the entire annual produce of the precious metals in different parts of the civilized world might, in 1857, be estimated as follows, viz.:—

America, excluding California	L.9,000,000
Asiatic Russia	3,500,000
Europe	1,550,000
California	14,000,000
Australia	11,000,000
Total	L.39,050,000

The question in regard to the probable continuation, increase, or diminution of this supply is of the greatest interest. Unfortunately, however, nothing but the vaguest conjectures can be offered with respect to it. Those who think that the supplies of the precious metals are likely to increase may allege that, being very widely diffused, fresh deposits will be successively brought to light; that the processes followed in the diggings, in the crushing of quartz rocks, and in the smelting and refining of the metals, will be further improved; and that the increase of population will make a still greater amount of labour be devoted to the search after these metals. But while we admit that there is a good deal of probability in these statements, still we question whether the result which they point at will be realized. Though gold be very generally distributed, it is extremely doubtful whether there be many places in which the deposits are so rich and so extensive as in California and Australia; and even in these the produce, as already seen, is either stationary or has begun to decline. The myriads of adventurers that are attracted to prolific diggings being all animated by the "*auri sacra fames*," and putting forth their entire energies, can hardly fail, in no very lengthened period, to rifle the richest beds. And when this is done,—when the excitement inspired by the original discovery is worn off, and the great prizes in the gigantic lottery recur only at distant intervals,—then, unless new and equally promising discoveries should be made, a serious check will be given to the gold-seeking mania. The process of quartz-crushing is believed to produce only moderate profits, and is not of a kind to collect crowds of competitors. The few fortunes that have been realized in California and Australia have not been made by the miners, but by the merchants and others who have supplied their real or imaginary wants, and bought their gold-dust and nuggets on advantageous terms. Of those engaged on their own account in the search for gold, very few have retired from the pursuit with anything like a competence. The great majority have hardly realized the wages current in the districts before the deposits were discovered; and the conviction seems to be everywhere gaining ground that more is to be made by cultivating the surface of the earth than by digging in its bowels or crushing its rocks.

Probable continuance of supply.

Earnings of the gold-seekers.

We have already seen that in 1856, when the produce of the gold-fields of Victoria was greater than it has been since 1852, it amounted to L.14,134,000. By far the largest portion of this immense sum is to be regarded as wages, or as belonging to the diggers and other adventurers engaged in its production. But a considerable portion must also be considered as the profit upon or return to the capital employed in the diggings, in crushing quartz rocks, in defraying the export duty (L.375,426 in 1856), with the expense of conveying the gold to Melbourne, and so on. It is not possible to say what these various items may amount to; but taking them at the low estimate of one million only, we have a sum of L.13,134,000 to be divided among those engaged in the gold-fields. Now, it appears from the official return that the population of the latter amounted, on the 26th December 1856, to no fewer than 115,343 men (including 18,104 Chinese), and 65,667 women and children.[1] And dividing the produce (under deduction of profits, &c.), or L.13,134,000, among the men employed, it gives a sum of nearly L.114 for the average wages of each. And this, considering the hardships and privations to which they are exposed, and the high price of most articles, is in truth but a poor remuneration. Inasmuch, however, as those employed were mostly adventurers, a few of whom made comparatively large sums, it follows that the earnings of the majority must have been proportionally reduced. It is, indeed, well known that a great many made, if anything, only the merest trifle. And nothing but the spirit of gambling, or the hope by which every one is inspired, that eventually he will stumble upon a nugget or a rich deposit, could induce them to continue in so poor a business.

The yield of the gold-fields fell off, as previously seen, from L.14,134,000 in 1856 to L.10,424,000 in 1857; and deducting from the latter one million for profits and expenses of all sorts, we have L.9,424,000 to be divided among the diggers and others employed in its production. And as the population of the gold-fields amounted, on the 28th February 1857, to 175,585, of whom 111,425 were men, and the residue women and children, it follows, supposing it to have continued at about the same level throughout the year, that the average earnings of the men would amount to L.84, 10s. each, which is less than the wages of most sorts of skilled labour in this country. The earnings of the Californian gold-seekers have not been greater. These facts have told already, and will tell more, the more they become known, on the European population of the gold-fields. The spirit of adventure and gambling is no doubt very powerful, but the knowledge of the vast preponderance of blanks in the gold-digging lottery cannot fail to reduce the numbers of those who embark in it. Immigration has already sustained a severe check; and it is not improbable that in the end the gold-fields will be principally wrought by Chinese labourers for such capitalists as may carry on the business as an ordinary and not very productive branch of industry. The general poverty of the soil of Victoria, and the injurious regulations which prevent its settlement, will tend to retard this result. But unless some new and more productive deposits, something to whet and excite the spirit of adventure, should be discovered, it is not easy to see how the depopulation of the gold-fields should be prevented.

It may be said perhaps that we have omitted in the previous statements to notice the supplies of gold that may be expected to be derived from the newly-discovered deposits along the Fraser River, in British Columbia, adjoining Vancouver's Island. Hitherto, however, no means have been afforded by which to form any estimate of the productiveness of these deposits. And independent of this circumstance, we do not think that we should be warranted in laying much stress on their discovery. To whatever extent they may be wrought, it seems most likely that those of California will be neglected in a corresponding degree. Except from the latter, there has been as yet no considerable influx of immigrants into British Columbia. And unless in the improbable event of the gold-fields in the latter being decidedly more productive than those in the former, there are but slender grounds for thinking that their aggregate produce will be materially increased. On the contrary, the better opinion seems to be, that it will be reduced by the population resorting in preference to agriculture, for which California is extremely well fitted, and the ordinary pursuits of industry.

We are therefore inclined to anticipate a falling-off rather than an increase in the supply of gold. But no great stress can reasonably be laid on any conclusion, whether on one side or another, in regard to matters which are liable to be affected by an infinite variety of circumstances which can neither be foreseen nor appreciated beforehand.

In all speculations in regard to the probable future supply of gold, it should be carefully borne in mind that any considerable fall in its value would certainly check its production, and consequently tend to lessen or prevent its further fall. It is plain, for example, that a decline of 10 per cent. in the value of gold would, *cæteris paribus*, occasion the abandonment of all those mines, diggings, washings,

---

Consumption of the Precious Metals.

Consumption of the Precious Metals.

crushings, &c., which yield only a nett profit of that amount. It is true, indeed, that the production of gold, as at present carried on, having far more of a gambling character than pertains to most branches of industry, the principle now stated would not operate so speedily as might perhaps be anticipated. But of its ultimate operation there can be no question; and it may therefore be laid down, that any reduction in the value of gold, which is not accompanied by a corresponding improvement in the method of its production, inevitably tends to correct itself, or to check or hinder its further reduction.

In the event, however, of an increase being destined to take place in the produce of the precious metals, we are disposed to believe that it will take place in silver rather than in gold. The disturbances that have so long prevailed in Mexico, and the other *ci-devant* colonies of Spain, cannot be perpetual. And when the reign of good order and security has been once more established in them, whether it be by the efforts of the inhabitants themselves, or, which is most probable, by their absorption into the United States, industry will again revive. And under such circumstances, and considering the extent and riches of the silver mines of these countries, the fair presumption is, that the supplies of silver would be largely increased. We should not, indeed, be at all surprised if, in the course of some twenty years or less, a cry were to be set up in regard to the fall of silver as compared with gold; and that the governments of such countries as may have a silver standard should be called upon to abandon it for one of gold.

But these are events of which it is not possible to cast the horoscope. They will gradually manifest themselves, but not to *à priori* inquirers.

PART II.—*Consumption of the Precious Metals.*

Consumption of precious metals.

In order to form a reasonable conjecture in regard to the probable influence of this vast supply of the precious metals, it is necessary to inquire into their uses and probable consumption. And this inquiry, we regret to say, is still more difficult, and more likely to be infected with errors, than the inquiry in regard to their production.

The precious metals are used as coin or currency to facilitate exchanges; as wealth which may be conveniently kept or hoarded; and they are used in the arts in the shape of plate, and in gilding, and so on.

The quantities employed in these functions are very large indeed. They vary, however, in different countries and periods with the circumstances peculiar to each; such, for example, as the greater or less abundance of paper money, and the degree in which the use of coins is lessened by the various devices resorted to for economizing currency; the fashion as to plate and furniture; the feeling of security at the time; and a number of other circumstances all liable to great and sometimes sudden changes.

Sum employed as money.

The gold and silver employed in this country as currency, and in the customary reserves in the hands of the bankers, is supposed to amount to from L.70,000,000 to L.75,000,000.[1] In France the precious metals employed in the same way probably amount to nearly double the sum now mentioned, or to L.130,000,000 or L.140,000,000.[2] And we believe that we may safely estimate the entire sum employed as currency in Europe, America (North and South), Australia, the Cape of Good Hope, and Algeria, at from L.490,000,000 to L.510,000,000, or L.500,000,000 at a medium.[3] Now, supposing this sum to be employed as above stated, as currency, we have first to inquire into its probable wear and tear and loss, and then into the probable rate of its increase. And taking into account the extraordinary extension of navigation and emigration, and the proportional risk of loss from shipwreck and other casualties, we are disposed to think that the annual wear and tear and loss of coin may be estimated at about 1½ per cent. of the entire mass of the currency; which, taking the latter at L.500,000,000, would amount to L.7,500,000 a year.

It is difficult to form any probable estimate of the rate at which the bullion used as currency may be likely to increase, supposing its value not to fall off. The extremely rapid increase of refinement and population in most parts of the civilized world, and especially in America and Australia, is known to every one. And it seems pretty certain that some important countries which have hitherto made comparatively little progress, are about to enter on a new career of industry and enterprise. In Russia, for example, the measures that are in progress for the construction of railways and the emancipation of the peasantry can hardly fail to awaken the dormant energies of the latter, and give new vigour to their exertions. And the capacities of that country are so very great that it is not easy to imagine, were its resources at all developed, to what an extent its wealth and population might be increased.

At present some of the finest, best situated, most extensive, and of old the most populous and flourishing countries in the world, groan under the deadly influence of the superannuated but destructive despotism of the Turks. It is difficult, however, to suppose, despite the efforts that may be made to bolster it up, that this miserable fabric of superstition and tyranny should hold together much longer. And were it overthrown, and anything like an efficient government established in its stead, a fruitful and all but boundless field would be laid open to industry and enterprise.

But without insisting on such prospective considerations, and looking only to the advances that are now being made, we do not think that we shall exaggerate if we estimate the increase of currency that is now going on at 2 per cent. on its gross amount (L.500,000,000), or at L.10,000,000 a year.

It is impossible, however, supposing this estimate not to be very wide of the mark at present, to conjecture how long the currency will go on increasing in this ratio. It may, as we have seen, be safely taken for granted that the sphere of civilization and commerce is destined rapidly to extend. But its expansion will no doubt be accompanied with various contrivances for economizing the use of metallic money; so that the quantity of it in circulation may not increase for any very lengthened period at the rate above stated. If it did, it would absorb an immense supply of gold. In barbarous countries, and in those which are entering on the career of civilization, the coins afloat may increase at the rate of 3 or 5 per cent., or more. But in countries which are more advanced their increase may be nothing, or less perhaps than even 1 per cent.

---

[1] It has been estimated as high as L.90,000,000; but the best authorities look upon this estimate as greatly beyond the mark.

[2] It has been estimated by Levasseur (p. 106) and others at no less than L.160,000,000! But this includes a portion of the coins that have been hoarded, and which can no longer be reckoned in the currency.

[3] It would be inconsistent with the objects of this article, and with the limits within which it must be confined, to engage in a discussion of the numerous and often conflicting statements and details on which this estimate has been founded. Some information with respect to it may be found in Chevalier's valuable treatise *De la Monnaie* (p. 326, &c.), Paris, 1850; in Stirling's *Gold Discoveries*, p. 182; in the learned and excellent tract of Tegoborski, *Essai de la Découverte des Gites Auriferes en Californie et en Australie*, &c., p 65; Levasseur, *De la Question de l'Or*, p. 106; in the work of Otreschkoff, *De l'Or et de l'Argent*; and a host of other publications. The precious metals in circulation in Russia in the early part of 1851 were estimated in the *Petersburg Gazette* (October 12, 1852) at 326,000,000 roubles, equal, at 40d. per rouble, to L.53,800,000. The greater part (190,000,000 roubles) of this currency consisted of gold.

Sum employed in the arts.

It is equally difficult to acquire any satisfactory information in regard to the quantity of bullion consumed in the arts. Jacob estimated its amount in Europe and America in 1830 at about L.5,900,000 a year. But it has since been repeatedly shown by various intelligent writers that this estimate was in many respects wide of the mark, and that on the whole it was a good deal under-rated. And supposing the consumption of the precious metals in the arts to have amounted to L.6,500,000 or L.7,000,000 in 1830, it must now be very much greater. Everywhere, indeed, but more especially in England, America, Germany, and Russia, there has been an extraordinary increase of population and wealth during the last eight-and-twenty years. Plate and plated articles for use and ornamental purposes are now in extensive demand among all but the very lowest orders. Vastly more persons are raising themselves from poverty to competence and affluence than at any former period; and these are universally large buyers of plate and other costly articles. Horace, were he now amongst us, would not venture to repeat his boast, that—

> "Non ebur, neque aureum
> Meâ renidet in domo lacunar." Lib. ii., Od. 18.

A taste for gilded saloons, magnificent glasses, and the gorgeous furniture of the age of Louis XIV., is at present all but universally diffused, and must have added greatly to the consumption of gold, which has been still further augmented by its increased outlay on the gilding of earthenware and china, harness, books, &c.[1] At the first blush of the matter, some of these items may not appear to the careless observer to be of much importance; but those who reflect a little on the subject, and who consider the immense and rapidly-increasing demand for the articles referred to in this country and Europe generally, and in America and Australia, will be satisfied that the total consumption of the precious metals, and especially of gold, in the way now mentioned, must be quite immense.

We incline to think that the value of the precious metals in Great Britain in 1857, in the shape of plate, watches, jewels, and trinkets of all descriptions, may be safely estimated at about L.4 to each individual of the entire population, making in the aggregate a sum of about L.88,000,000, to which, if we add L.12,000,000 for Ireland, the whole will amount to L.100,000,000. And vast as this sum may appear, we believe it is inside the mark. Silver spoons and forks, silver tea-services, with trays, &c., are now universally met with throughout the middle as well as the upper classes; while most families, of any antiquity or consideration of any kind, possess large quantities of ornamental as well as useful plate. In the Continent and the United States the bullion invested in the way now stated is very great indeed. In Italy and some other countries the lower classes, especially the women, though not generally so well off as in England, spend more money upon massive rings, chains, brooches, and such like articles, which they regard much as girls in England do their deposits in the savings-bank, as a reserve fund or capital.

We are aware that Jacob says, that "In the present day in this country the quantity of gold and silver in actual existence, including utensils, ornaments, jewelry, trinkets, and watches, is three or four times as great as the value of those metals which exists in the form of money." (*Historical Inquiry*, i. 210.) And as the value of the precious metals in Great Britain, in the shape of coin, is certainly not less at present (1858) than L.70,000,000 or L.75,000,000, the value of the bullion in plate, jewellery, &c., ought, on this hypothesis, to amount to at least L.210,000,000 or L.280,000,000! But there can be no manner of doubt that the lowest of these sums would be far beyond the mark. Tegoborski, indeed (*Gites Aurifères*, &c., p. 66), who is supported by Humboldt (*Nouvelle Espagne*, iii., p. 465, ed. 1827), estimates the value of the bullion vested in plate, watches, jewellery, &c., at only half the amount vested in coin. But this estimate, though not perhaps very far wrong if applied to the poorer countries of Europe, would undoubtedly, if applied to Great Britain, be as much under as that of Jacob is above the mark.

But, without pretending to an accuracy which, on such subjects, is unattainable, we run little risk in concluding that the expenditure of bullion in the arts—that is, in plate, jewellery, gilding, &c.—in Europe, America, and Australia, cannot at present (1858) be under, if it do not exceed, L.15,000,000 or L.16,000,000 a year. But of this a portion, estimated at about one-fifth, or 20 per cent., is supposed to be obtained from the fusion of old plate, the burning of lace, picture-frames, &c. And hence, if we deduct from the L.15,000,000 used in the arts 20 per cent for the old bullion, we have L.12,000,000 for the tota quantity of the supplies from the mines annually disposed of in this way; a considerable portion of which, including that used in the gilding of rooms, earthenware, books, harness, buttons, &c., cannot be again recovered or applied to any useful purpose.

And however great it may appear to be, this amount will be largely increased with the increase of population and the spread of refinement in the arts, and still more by anything like a considerable fall in the value of bullion.

Total consumption of gold and silver.

Hence it would appear, putting these items together, that the annual consumption of bullion as currency, and in the arts, amounts to about L.29,500,000, viz.:—

Wear and tear and loss of coin,............	L.7,500,000
Increase of currency.........................	10,000,000
Used in the arts..................................	12,000,000
Total	L.29,500,000

It will be difficult to show that these estimates are beyond the mark; and supposing them to be nearly correct, it follows, deducting the above sum from the previously estimated produce of the mines (L.39,050,000 – L.29,500,000), that we have a surplus of L.9,550,000 to defray the sums required for hoarding, for exportation to the East, &c. And there certainly seems to be little reason for thinking that a supply of this amount will do more than meet the demands upon it.

It may be said, perhaps, that we must have exaggerated the consumption of the precious metals, inasmuch as the sum which we suppose is annually consumed considerably exceeds the entire produce of the mines previously to the supplies from California and Australia. But, while we admit the fact to be as stated, we deny the inference which is attempted to be drawn from it. The truth is, that while the discovery of the Californian and Australian deposits has added in so great a degree to the supply of bullion, it has also added very largely to its consumption. It has given an unparalleled stimulus to emigration and commerce. The population of California and Victoria has increased in a ratio hitherto unheard of, or from next to nothing a dozen years ago, the former to 507,000 in 1856 (American Almanac for 1858), and the latter to 463,000 on the 31st December 1857. But despite this increase, wages, owing to the general desire to speculate on one's own account, continue to be extravagantly high. In California in 1856 miners readily obtained from 10s. to 25s. a day, according

---

[1] Estimates have been made of the expenditure upon some of these items, but the data on which they are founded are too vague to entitle them to much attention.

Consumption of the Precious Metals.

to their skill and capacity for enduring fatigue; common labourers from 8s. to 12s. a day; and house-servants from L.5 to L.6 a month. For a while most articles were proportionally high, so that these extravagant wages were not so advantageous to the parties receiving them as might have been supposed. But there has latterly been a great fall in the price of manufactured goods and colonial produce; while, owing to the progress of agriculture, provisions have also been greatly reduced. Lodgings are still very dear, but not so exorbitant as formerly. In Australia, the state of things for a while after the discovery of the gold-fields, was not very dissimilar; wages, however, though still very high, are now (1858) a good deal lower there than in California; while in other respects there is but little difference between the two. And if, in addition to these unprecedented circumstances, we take into account the unsettled character of the population, with the absorbing pursuit of wealth on the one hand, and the utter recklessness of expenditure on the other, we must be satisfied that the currency of these countries cannot be otherwise than excessive as compared with their population.

The powerful influence of the late gold discoveries is not, however, confined to California and Australia. The emigration to these countries, and the new and rapidly-increasing markets which they afford, have told effectually here, and indeed in every commercial country. In England the rise of wages cannot be estimated at less than from 10 to 30 per cent., while in Ireland it has been a good deal more. And though the rise of wages in the latter be in part ascribable to the famine of 1846–47, and in a still greater degree to the emigration to the United States, yet, as this emigration has been powerfully promoted by the efflux of emigrants from the Atlantic states to California, it is clear that the gold of the latter has been at bottom a prominent cause of the improvement in the condition of the Irish peasantry. The same may be said of the emigration from Germany, which has latterly become of first-rate importance. At an average of the seven years ended with 1852, it amounted to 103,591 individuals a year; the numbers in 1851 and 1852 being respectively 120,708 and 155,730, of which by far the greater portion was destined for the United States. (*Report of Emig. Com. for* 1853, p. 104.) In 1854 the emigrants to the latter from Germany only, amounted to no fewer than 223,862; and though not so great since, they are still very numerous, having amounted in 1857 to 91,781. (Hunt's *Com. Mag.*, June 1858, p. 768.)

The rise of wages consequent on these extraordinary mutations, and the increased exports of produce which they have occasioned, have exercised a powerful influence in the United States as well as in Europe. And there, consequently, as well as here, a greater supply of bullion is required to serve as currency. And while this influence is operating on the one hand, on the other the swarms of *parvenus* who are every day rising to opulence, contribute to swell the demand for all sorts of things, but especially for plate and plated goods, jewellery, and such like articles. And what is probably of still greater importance, the metallic basis of the currency is everywhere being enlarged; and the conviction is rapidly gaining ground in the United States as well as in Europe, that no paper currency can be safe unless effectual measures be taken to maintain such a supply of the precious metals in the countries in which it circulates as may be necessary to ensure its immediate conversion into coin.

Consumption of the Precious Metals.

Burying of gold and silver in Europe.

Burying of Gold and Silver.—It is singular that, in estimating the consumption of gold and silver, Jacob did not make any allusion to the practice which has uniformly prevailed in all countries harassed by intestine commotions or exposed to foreign invasions, of burying treasure in the earth. Of the sums so deposited a very considerable proportion has been altogether lost, and this has no doubt been one of the principal means by which the stock of the precious metals has been kept down to its present level. Every one is aware that during the middle ages *treasure trove*, or money dug from the ground, formed no inconsiderable part of the revenues of this and most other countries.[1] And though the burying of money has long ceased in Great Britain, such has not been the case among our neighbours. Wakefield tells us that down to 1812 the practice was common in Ireland;[2] and though much fallen off in the interval, it continues to this day to be occasionally resorted to in that part of the kingdom. It has always prevailed, sometimes to a less and sometimes to a greater extent, in almost every part of the Continent.[3] The anarchy and *brigandage* that accompanied the revolution of 1789 made the practice be carried to an extraordinary extent in France; and there owing to various causes, which are too obvious to require being pointed out, it still maintains a broad and firm footing. So much so is this the case that, to use the words of a distinguished authority, "*En France nous enfouissons notre argent dans nos coffres, ou nous le cachons dans les murs de nos maisons et les sillons de nos champs, selon les vieilles coutumes de l'Orient. Il y a peut être un milliard* (FORTY MILLIONS sterling) *de notre numeraire rendu ainsi sterile.*"[4] And yet we doubt whether the burying of treasure be at present as prevalent in France as in many parts of Germany, and in Hungary, Russia, Italy, Spain, and European Turkey. The feeling of insecurity that has prevailed in all these countries, especially since 1848, has given a stimulus to this practice which nothing can countervail. Of the many millions that were distributed among the countries round the Black Sea during the recent campaigns in that quarter, the greater portion is believed to be as much withdrawn from circulation as if it had never been dug from the mine.

It is impossible, of course, to form any estimate of the sums that are thus annually placed as it were in mortmain. They vary from year to year, and are always greatest when wars or revolutionary disturbances are in progress, or when their occurrence is anticipated, or but little confidence is placed in the permanence of existing institutions. There can, at all events, be no question that the sums which have been disposed of in the way now stated in the different continental countries of late years have been quite enormous—greater, perhaps, than those absorbed by any of the other channels of expenditure.

Exportation of the precious metals to the East.

Besides the countries already mentioned, there is a vast portion of the earth's surface, including Turkey in Asia, Arabia, Persia, India, China, and other eastern territories, into which bullion has been largely imported from the remotest æra. During the intercourse of the Phœnicians, Greeks, and Romans, with the East, gold and silver, obtained from the mines of Spain and other European countries, always formed important articles of export to Arabia and India. The same notions of the mischievous influence of the exportation of these metals that have prevailed in modern times were also prevalent in antiquity; and various efforts were in consequence made to hinder its taking place. That such had been the practice in the earlier periods of Roman history, is evident from the statement of Cicero,[1] and the prohibition was repeatedly renewed, though with very little effect, by the emperors. Tiberius complained to the Senate that the wealth (meaning gold and silver) of the state was irrecoverably consigned to foreign and hostile nations in exchange for luxuries and female ornaments.[2] Pliny computed the annual drain of cash to India only for these objects at fifty million sesterces, or L.400,000;[3] and to India, China, and Arabia, at double that sum, or L.800,000.[4] And the drain thus early commenced, though varying in intensity, has continued, with but little interruption, down to the present times. Since the establishment of the East India Company in 1600, gold and silver have usually been among the best and safest articles of export to the East. And despite the vast quantities of these metals, but more especially of silver, that have thus been poured into India, they appear of late years to be in greater request than ever in that and the adjacent countries. The supplies thrown upon their markets, like the water poured into the sieves of the Danaids, completely disappear, or are so absorbed that the demand for fresh supplies continues without any abatement.

[2] *Account of Ireland*, i., p. 593.

[3] Storch, *Economie Politique*, i., p. 222, 1823.

[4] Dupuynode, *De la Monnaie, Du Credit*, &c., i. 182, Paris, 1853; one of the best of the late French publications on the important subjects of which it treats.

Humboldt estimated that, of the entire produce of the American mines at the commencement of this century, amounting, as already seen, to 43,500,000 dols., no less than 25,500,000 were sent to Asia,—17,500,000 by the Cape of Good Hope, 4,000,000 by the Levant, and 4,000,000 through the Russian frontier. And though it be generally believed by later authorities that this estimate was beyond the mark,[5] still there is no manner of doubt that the drain of bullion to the East was then, and for several years before and after, of the most formidable dimensions. Gradually, however, it began to diminish, partly in consequence of the decrease in the supplies of bullion from America subsequently to 1808, and partly, and we believe principally, from the great and sudden increase in the exports of cottons and other manufactured goods to India which followed the opening of the trade in 1813. Such, indeed, was the influence of these and other concurring causes, that in 1832 and 1833 the export of bullion from England to India had not merely ceased, but the tide had actually begun to set in the opposite direction. This abnormal state of things did not, however, continue for any very lengthened period. For a few years there was no very decided movement of bullion either from Europe to the East, or from the East to Europe. But this approach to an equilibrium has wholly passed away. Within the last dozen years the drain of bullion from Europe to the East has again set in with renewed force, and is become deeper and broader than at any former period. And yet, despite their continued influx, there is no general rise of prices nor anything to show that India is becoming saturated with the precious metals, or even with silver. On the contrary, the supply appears to be as deficient as ever; and it is doubtful whether this apparently bottomless abyss be not of itself sufficient to swallow up the largest portion, if not the whole, of the late extraordinary additions to the supply of bullion. The following returns supply the latest and most authentic information in regard to the exportation of bullion to the East:—

[2] Taciti, *Annal.*, lib. iii., cap. 53.

[3] "Digna res, nullo anno imperii nostri minus H. S. quingenties exhauriente India, et merces remittente." (*Hist. Nat.*, lib. vi., cap. 23.)

[4] "Minimaque computatione millies centena millia sestertium India et Seres, peninsulaque illa (Arabia) imperio nostro adimunt. Tanto nobis deliciæ et fœminæ constant." (Ibid., lib. xii., cap. 18.)

[5] "Humboldt, cela n'est plus douteux, estimait trop haut la valeur de l'or et de l'argent, qui s'écoulaient au commencement de ce siècle d'Europe en Asie, et portaient trop bas la déperdition qu'ils éprouvaient, dans la même temps, par le frottement et leur conversion en objets d'orfevrerie et de bijouterie." (Dupuynode, *De la Monnaie*, &c., i., p. 35.) There is no longer any doubt in regard to the accuracy of the latter part of this statement; and it is pretty generally supposed that the first part is also well founded.

Consumption of the Precious Metals.

II. *Total Exports of Bullion from Great Britain to the East for each of the Seven Years ending* 1857 *(from Tables compiled by James Lowe, Esq., of Austin-Friars).*

Years.	Gold.	Silver.
	L.	L.
1851	102,280	1,716,100
1852	921,739	2,630,238
1853	880,202	4,710,665
1854	1,174,299	3,132,003
1855	948,272	6,409,889
1856	404,749	12,118,985
1857	269,275	16,795,232
Total for seven years	4,700,816	47,513,112
Annual average	671,545	6,787,587

Total Exports of Bullion from the Mediterranean Ports to the East, for each of the Five Years ending with 1857.

Years.	Gold.	Silver.
	L.	L.
1853	93,528	848,362
1854	48,456	1,451,014
1855	243,239	1,524,240
1856	74,039	1,988,916
1857	259,986	3,350,689
Total for five years	719,248	9,164,221
Annual averages	143,849	1,832,844
Total annual averages	815,394	8,620,431
Total annual average of gold and silver, L.9,435,825.		

To which have to be added the exports by the Black Sea, the Russian and Turkish frontiers, &c. But the exports of bullion to the East in the current year (1858) have greatly fallen off; and will not exceed L.5,700,000. (See *post.*)

It is of importance to observe that, of the silver exported from England in 1857, nearly a third part, or L.5,451,698 went to China.

III. *Account of the Imports and Exports of Treasure into and from India, during each of the Twenty-three Years ending with* 1856–7.

Years.	Imports.	Exports.	Excess of Imports.
1834–35	L.1,893,023	L.194,741	L.1,698,282
1835–36	2,146,465	108,109	2,038,356

* Not stated whether gold or silver.

Causes of the drain of bullion to India.

It is difficult to account for the long-continued and heavy drain of bullion to India. It would seem, however, to be principally owing to the following circumstances, viz. :—1. To the country having no mines of its own ;[1] 2. To the great amount of the population, their early civilization and poverty, and their habit of wearing ornaments of silver and gold ; and, 3. To that burying and hoarding of the precious metals which is perhaps more prevalent in India than anywhere else.

1. The influence of the first of these causes of the importation of the precious metals into India is too obvious to require any illustration.

2. The influence of the second cause of the importation referred to is of the most powerful kind. From the remotest period the people of India have been in a considerably advanced state of civilization, which, owing to the early institution of castes and other circumstances, has continued in a comparatively stationary state. Owing also to the economical habits of the people, and the facility with which they have obtained subsistence, their wages have always been, and continue to be, extremely low. And from the combination of these and other causes, the businesses carried on in India have, with few exceptions, been generally on a petty scale ; and while comparatively few large payments have to be made, the everyday transactions of an immense population, though individually small, amount in the aggregate to a very great sum. And hence the extraordinary demand for silver to serve as coin in retail transactions, and for *cowries*, inferior in value even to the smallest coins.

And in addition to the very great sums required for currency, another, and also a very large sum, is absorbed in jewellery or trinkets. The habit of wearing rings, bracelets, brooches, hair-pins, and such like personal ornaments of gold and silver, but generally the latter, is universal in India, and cannot fail to occasion a very large expenditure. There are no data on which to build up an approximate estimate of the gross amount of the sums invested in the coin in circulation and in trinkets in India. It has, however, been said that it is quite conceivable it should come up to 400,000,000 sterling ;[2] and to those who bear in mind that the population is not less perhaps than from 150,000,000 to 160,000,000, and that metallic ornaments are worn by all but the most degraded persons, this conjectural estimate may not appear to be in any degree extravagant.

But if it be not very far from the mark, the wear and tear or abrasion and loss upon so great a sum, being taken at only 1 per cent., would require an influx of bullion to the extent of L.4,000,000 a year. And as this source of loss may be regarded, so to speak, as a constant quantity, it is plain that if, owing to circumstances affecting the commerce of the Peninsula, or any other cause, this supply

---

[1] This statement may not, perhaps, be strictly correct. It is affirmed that gold and silver have been produced in India ; but if so, it is admitted on all hands that the production has been so inconsiderable as to be unworthy of notice.

[2] Newmarch in *Tooke on Prices*, vi., p. 723.

Consumption of the Precious Metals.

should be diminished for a few years, the demand for bullion would be proportionally increased as soon as the disturbing force had ceased to operate.

3. We have already noticed the burying or hoarding of treasure in Europe. But the practice has been carried to a still greater extent in India, Persia, Turkey in Asia, and other eastern countries, than anywhere in the western world. Despotism and a want of security have always prevailed in these countries. The inhabitants have in consequence been accustomed to regard the money they have committed to the earth as their only real wealth, and have availed themselves of every opportunity to place portions of their means beyond the grasp of their avaricious and tyrannical masters. And as many of the hoards so deposited will never be brought to light, the practice has undoubtedly been a principal cause of the constant flow of bullion to the East.[1]

Bernier, "that most curious traveller," as he is called by Gibbon,[2] remarks on this subject as follows, viz. :—"Avant que de finir, je dirai d'ou peut venir que cet empire du Mogol étant ainsi une abyme d'or et d'argent, comme jai dit dans le commencement, on ne voit neanmoins pas qu'entre le peuple il y en ait davantage qu'ailleurs, au contraire le peuple y paroit moins pecuniex et l'argent s'y trouvent plus rare qu'en beaucoup d'autres endroits.

"La premiere raison est qu'il s'en consomme beaucoup a fondre et refondre tous ces anneaux de nez et d'oreilles, chaines, bagues, et brasselets des pieds et des mains que portent les femmes; et principalement dans cette incroyable quantitè de manufactures où il en entre tant, que se perd, et qu'on ne sçait ce qu'il devient, comme dans toutes ces broderies, alachas ou étoffes de soye rayes, &c. &c." And then, having adverted to the injustice and exactions to which the mass of the people are exposed, he goes on to state,—"D'ou vient qu'un chacun est dans une crainte perpetuelle de ces sortes de gens, et surtout des Gouverneurs, plus qu'une esclave de son maitre. Que pour l'ordinaire ils affectent de paroitre gueux et sans argent, très-simples dans le vestement, logement, ameublement, et encore plus dans le boire et le manger. Qu'ils apprehendent même souvent de se mesler trop avant dans le negoce, dans la crainte qu'ils ont qu'on ne les croye riches et qu'on ne leur trâme quelque piece pour les ruiner; si bien qu'enfin ils ne trouvent point de meilleur remede que de cacher et enfouir leur argent bien secretement et bien profondement en terre, sortant ainsi hors du commerce ordinaire des hommes, et perissant enfin là dedans, sans que le Roy ni l'etat, ni que ce soit en profite. Ce qui arrive non seulement entre les païsans et artisans, mais ce qui est plus considerable entre toutes sortes de marchands, soit Mahometans soit Gentils; mais principalment entre les Gentils qui sont presque seuls les maitres du negoce et de l'argent, infatuez qu'ils sont de cette croyance, que l'or et l'argent qu'ils cachent durant leur vie leur servira après la mort; et c'est à mon avis la veritable raison pourquoi il paroit, si peu d'argent en commerce parmi le peuple." (Bernier, *Voyage dans les Etats du Grand Mogul*, i., pp. 306–311, Amst. 1710.)

And at a later date, Mr Luke Scrafton has referred to the same practice in still stronger terms:—"In India," says he, "the Hindoos bury their money underground, often with such secrecy as not to trust their own children with the knowledge of it; and it is amazing what they will suffer rather than betray it. When their tyrants have tried all manner of corporal punishments upon them, they threaten to defile them; but even that fails; for, resentment prevailing over the love of life, they frequently rip up their bowels or poison themselves, and carry the secret to their graves. And the sums lost in this manner in some measure account why the silver of India does not appear to increase, though there are such quantities continually coming into it, and none going out." (*On the Government of Hindostan*, p. 16.)

The comparative security that was lately enjoyed by the natives in most parts of India may have done something to lessen this habit. But one so widely diffused and so deeply rooted, could not be easily or speedily modified. And though the illegal exactions of their rulers were curbed and partially put down in the countries directly under the Company's government, there was in Oude and many other parts of India, previously to the late insurrection, a great deal of disorder, oppression, and robbery. And since that unfortunate outbreak insecurity and disorders of all sorts have immeasurably increased, and have proportionally stimulated the practice of hoarding. The rebellion raging in China has had similar effects; and we have been assured by those who, from experience and observation, are well qualified to form an opinion on such a subject, that it may be moderately estimated that in India and China, during the half-dozen years ending with 1857, a sum of not less than L.100,000,000 sterling has been consigned to the earth.

Trade of the United Kingdom with India and China.

But in addition to those now noticed, which, though varying in intensity, may be regarded as being to a considerable extent constant in their operation, the state of the trade between Europe and America and the East has latterly been such as to lead to an unusual increase in the exports of the precious metals to the latter. This has been occasioned by the value of the imports of the commodities of India and China into this country and the United States very greatly exceeding the value of the manufactured and other produce exported to them, and leaving a large balance which could not be cancelled otherwise than by an equivalent exportation of bullion. This is evident from the following statement, viz. :—

Countries.	1854.	1855.	1856.	1857.
	L.	L.	L.	L.
Exports from United Kingdom to India, incl. Singapore......	9,643,693	10,622,118	11,419,004	12,562,996
Exports from United Kingdom to China, incl. Hong Kong...	1,000,716	1,277,944	2,216,123	2,449,982
Totals..............	10,644,409	11,900,062	13,635,127	15,012,978
Imports from India, incl. Singapore, into United Kingdom.	11,466,967	13,284,470	18,069,350	19,590,404
Imports from China incl. Hong Kong, into U. Kingdom...	9,125,040	8,746,590	9,421,648	11,448,639
Totals..............	20.592,007	22,031,060	27,490,998	31,039,043
Excess of imports over exports........	9,947,598	10,130,998	13,855,871	16,026,065

A portion amounting to about L.3,000,000 or L.3,500,000 of the excess of imports consists of remittances from India on account of the home expenses of the East India Company. But after this portion is deducted, the excess of imports is still very great, amounting to about L.6,500,000 or L.7,000,000 a year in 1854 and 1855, and to no less than from L.10,000,000 to L.13,000,000 a year in 1856 and 1857.

There has been, during the present year (1858), an increase to the extent of about L.4,000,000 in the amount of the exports of British produce to India (L.3,695,000 in the first ten months). But this increase has been in great measure, if not wholly, owing to the military operations now going on in India, and affords no grounds for estimating what the exports may amount to after tranquillity has been restored.

Trade of United States with India and China.

The same excess of imports over exports which characterizes the trade between Great Britain and India and

---

[2] *Decline and Fall*, i., p. 267, ed. 1838.

China, distinguishes also, though in a less degree, the trade between the United States and these countries. Thus in the year ending 30th June 1857, the value of the exports of all sorts of produce from the United States to India and China amounted to 5,373,067 dols., and that of the imports to 19,123,146 dols.; leaving a balance of no less than 13,750,079 dols.,[1] or about L.3,300,000 to be provided for by drafts on London and other places indebted to America.

Trade between India and China.

From the period when we have authentic accounts of the trade between India and China, it is found that the exports of cotton and other produce from the former to the latter have usually exceeded the imports; so that China, which has mines of the precious metals, has been one of the principal sources from which India had drawn her supplies of bullion. But down to 1830 the drain from the former to the latter was confined within reasonable limits. Subsequently, however, owing to the growing taste for the opium of India, and its enormously increased consumption in China, the exports of bullion from the latter to India were increased to such an extent as to lay the Chinese under very serious difficulties. It appears, for example, that at an average of the seventeen years ending with 1850–51, the annual value of the merchandise exported from India to China amounted to L.4,564,400 a year, and that of the merchandise annually imported, to only L.643,210, leaving a balance of no less than L.3,921,190 a year to be paid in bullion and in drafts on London and other places indebted to China; and this balance has increased during the intervening period, though, owing to the disturbances that have lately prevailed in India as well as in China, the recent state of the trade between them affords no just example of its state in ordinary years. We may, however, mention that in 1856 the imports of opium into China from India amounted to about 66,500 chests, which, at 420 dols. per chest, gives a gross sum of about L.6,200,000 for this item only.[2] Under such circumstances, it might have been supposed that, whether there were or were not a demand for the bullion of the West in China, India at all events would be pretty well supplied with bullion brought from the latter. But, as already seen, this is very far indeed from being the case. Notwithstanding the great increase in the exports of British produce to India, the imports of Indian produce into the United Kingdom are still greater; while the annexation of the Punjab and other provinces, and the peculiar state of India, has greatly increased the internal demand for bullion.

But while China has on the one hand a considerable balance against her on the trade with India, she has, on the other, a still larger balance in her favour on the trade with Europe and America; so that latterly her imports of bullion have greatly exceeded her exports. This has been mainly owing to the trifling amount of the exports of British produce and manufactures to China, which, though much augmented of late years, did not amount to L.2,500,000 (L.2,449,982) in 1857, being only between one-fourth and one-fifth part of the value of the imports from China in that year. The latter, however, were then unusually large, the imports of silk only having risen from 2,838,047 lb. in 1853, to 6,664,532 lb. in 1857, while the price of the silk rose at the same time about 50 per cent.; and hence it is that of the silver exported from England in 1857, the following amounts went to China, viz:—

Singapore, in transit for China	L.875,583
Hong Kong	2,048,795
Canton	28,592
Shanghai	2,398,728
Total	L.5,451,698

But the importation of Chinese silk having been overdone, has sustained so severe a check that the imports in the present year (1858) will not probably exceed 2,000,000 lb.,[3] obtained at a greatly reduced price. It is therefore all but certain that the late heavy balance against us in the trade with China has already been very materially reduced; and hence the great reduction, already noticed, in the exports of bullion to the East generally in 1858, and more especially in those to China, which will not probably exceed L.1,500,000. But despite its fluctuations, the drain of bullion from Europe (or Australia) and America to China must necessarily continue so long as the immense importations of tea, silk, and other Chinese products are not fully balanced by the exports; and there are various circumstances which make it doubtful whether this will speedily be the case. The events now (December 1858) in progress must, however, have a considerable influence, which it is yet too soon to appreciate. But the increased facilities given to trade by the late treaty, and more especially the abolition of the tolls and duties by which foreign products were prevented from penetrating into the interior, can hardly fail, provided they are *bona fide* carried out, to add considerably to the imports, and will consequently bring them nearer to an equality with the exports.

Down to rather a recent period the importation of opium into China, and its cultivation in the empire, were both forbidden by law. But as everybody knows, and we have seen, the prohibition of importation has long ceased to be of any practical efficiency; and during the last two or three years it has been openly admitted at most ports on moderate payments being made to the authorities. In the arrangements which have recently been made with the Chinese, there is one that legalizes the importation of opium at a duty of 30 taels per picul of 133⅓ lb.

Whether, however, its free importation will increase the demand for the opium of India is not so very clear. Opium is already cultivated to a great extent in China, and its growth is said to be rapidly increasing. There could not, indeed, be any conceivable motive after its importation had been permitted, for attempting to prohibit its being raised at home. And if, as many anticipate, the native supplies of opium should, notwithstanding their alleged inferiority in point of quality, eventually suffice for the consumption, India will lose her market for opium, and government will be deprived of the revenue of nearly L.5,000,000 a year it has latterly yielded, in the most unobjectionable manner, to the East India Company. The existing drain of bullion from China to India would, under such circumstances, either wholly cease, or be greatly reduced.

But it is important to bear in mind that, though changes in the trade between China and India, and between these countries and Europe, may lead to changes in the transmission of bullion from the one to the other, these changes, in as far as Europe and the East generally are concerned, can be temporary only. Owing, as already seen, to the want of mines, and the peculiar and deeply-rooted habits of its vast population, India must always have a very extensive demand for bullion, and to it, consequently, it will be sure to find its way. The supplies sent to it may not be paid for by shipments of its goods direct to Europe; but if not, they will be paid for indirectly by imports from China and other countries having payments to make to India.

Impolitic regulation in regard to the currency of India.

Some of the circumstances peculiar to India to which we have previously adverted, are such that by far the larger portion of the currency must necessarily consist of silver coins; and in 1835 they were made the only legal tender. But though not legal tender, gold coins continued to circulate in India; and a proclamation issued in 1841 directed them to be received at the public treasuries. Little attention was paid to this measure at the time; but after the discovery of the gold deposits in Australia, it became probable, if gold coins continued to be received by the public departments, that eventually none else would be paid into them, and that silver would cease to be employed except in petty payments. This contingency appears to have alarmed the government; and notice was accordingly given on the 22d December 1852, that from and after the 1st January next (1853) gold coins would not be received on account of taxes or other payments due to the public. Silver has consequently again become in fact as well as in law the sole legal tender of India. A good deal of controversy has taken place in regard to this measure. It is plain that, by continuing to act on the proclamation of 1841, government would have practically set aside the law of 1835, which made silver the only legal tender; and would thus have made itself responsible for the losses that might in consequence have resulted to individuals, and for the risk of having its own revenues reduced by the anticipated fall in the value of gold.

---

[1] Report on the Commerce and Navigation of the United States for the year ended 30th June 1857, printed by order of Congress.

[2] *Papers on the Trade of various Places*, &c., 1857, p. 27. In 1857 the imports are said to have amounted to above 76,000 chests. (Crawfurd's Lecture at Leeds.)

[3] 1,849,918 lb. in the first ten months, against 5,270,330 lb. in the same period of last year.

But these appear to be most inadequate grounds for the course that was adopted. There are no sufficient reasons for supposing that any material, or indeed sensible injury, would have resulted either to the government or to individuals from the contingencies referred to; and there are at the same time various circumstances which make it much to be regretted that an attempt should have been made to exclude gold from the currency of India. Silver coins, being the only ones fitted to serve the purposes of the great bulk of the inhabitants, must always be in extensive demand in all parts of the peninsula. But had gold also been allowed to circulate as coin, it is most likely that it would have been extensively employed in making large payments, and it would also have been extensively hoarded. Even as it is, leaf and bar gold have been of late largely imported into India from China, to be used in the arts or buried. In 1855–6, for example, the imports in question amounted to no less than L.1,508,541; the fair presumption being, that but for the suppression of gold as currency, they would have been very much greater. And if so, the increased demand for gold would, on the one hand, have in so far counteracted that fall in its value which has been so generally apprehended; while, on the other, it would, by lessening the demand for silver, have checked any tendency it may have had to rise. And for these, and other reasons that will readily suggest themselves to the reader, it would be good policy to re-introduce a gold currency. It is contrary to all principle, and indeed to the plainest dictates of common-sense, to exclude it by forcible means from a field where it would otherwise be largely used, the more especially as by doing this we create an unnatural demand for silver at the very time when it is supposed to be rising in value as compared with gold.

Besides the powerful influence that the reverting to a gold currency would have in opening a new demand for gold, and lessening the existing demand for silver in India, there can be little doubt that gold will become in greater request in the latter. It is believed by many that the late outbreak in India will be the harbinger of a better order of things throughout that wide region; and if such should be the case, and its wealth and civilization be augmented, gold would be more largely used than at present in the arts or in the manufacture of jewellery and ornaments of all kinds, as well as in the effecting of large payments. Hence, on the whole, we are inclined to anticipate that at no distant date the exports of silver to the East will be diminished and those of gold increased. Such a result would be materially hastened by any considerable increase in the value of silver as compared with that of gold. But, independently altogether of a contingency of this sort, which depends on a great variety of circumstances, it seems fair to infer that the restoration of tranquillity in India will be accompanied by a decrease in the imports of silver and an increase in the imports of gold,—a result which would be further and effectually promoted by government again making and receiving payments in gold.

Substitution of gold for silver

Hitherto, both gold and silver coins have been legal tender in the United States, France, and some other countries. Wherever such is the case, the value of the coins in respect of each other has to be fixed by authority; that is, it has to be enacted that debts may be discharged by payments either of gold or silver money, at the rate of so many dollars to the eagle, francs to the Napoleon d'or, shillings to the sovereign, and so on, as laid down in the mint regulations of the different countries. But however correct at the periods when they are made, these valuations speedily become incorrect; and whenever such is the case, it is for everybody's advantage to make all his payments in the metal which happens to be overvalued as compared with the other. And hence the use of gold as money in preference to silver in England, and of silver in preference to gold in France and the United States.

In the improbable event of the mint valuations of gold and silver continuing for any considerable period to be nearly identical with their real values, the former would be sure to be preferred as money to the latter in all but petty transactions. Being much more valuable in proportion to its bulk and weight than silver, gold is more easily concealed and carried about. Where notes circulate of a low value, the advantage now referred to on the side of gold is less obvious. But such low notes are in all respects most objectionable; and where, as in England, there are no notes in circulation for less than L.5, and in France for less than 50 francs, the use of gold as money is accompanied with so many advantages that we are disposed to think it would maintain its place even though it were somewhat underrated as compared with silver. Inasmuch, however, as gold has so many natural grounds of preference on its side, the true plan is to make it the only standard, and to use silver merely as a subsidiary currency. This plan has been followed since 1817 in this country with the most complete success; and there is no reason to doubt that it may be elsewhere adopted with equal advantage.

in France.

The late extraordinary demand for silver in India has been quite enough to make gold be substituted for it in those countries in which they are equally legal tender. In France, for example, where the metallic currency consisted, down to 1850, almost wholly of silver, it now consists principally of gold. This is evident from the following account of the gold and silver coined in that empire from 1850 down to 1857, both inclusive:—

Years.	Gold.	Silver.		Total.	
	Fr.	Fr.	c.	Fr.	c.
1850...	85,192,390	86,458,485	20	171,650,875	20
1851...	269,709,570	59,327,308	90	329,036,878	90
1852...	27,028,270	71,918,445	50	98,946,715	50

Consumption of the Precious Metals.

Substitution of gold for silver in the United States.

In the United States the coinage of gold has increased in a somewhat similar ratio, having risen from 9,007,761 dollars in 1849 to 62,614,492 dollars in 1851, and 59,343,465 dollars in 1856. Hence gold coin is now used in these two countries, as it is used in England, in all considerable payments which are not effected by notes or cheques; while large portions of the silver coin that has in consequence been disengaged have found their way to the East.

This substitution of gold for silver, while it materially enlarges the field for the employment of the former, proportionally narrows that for the employment of the latter. And hence a very considerable permanent addition may be made to the comparative supply of gold without its value, measured in silver, being materially affected. In the end, no doubt, the values of both metals will be proportioned, independently of variations of demand, to the respective costs of their production. But before this equalization can take place, they must be distributed among the various countries of the world according to the circumstances peculiar to each, including therein their peculiar aptitudes for different purposes, and the novel conditions of their supply.

In Holland, as well as India, that substitution of gold for silver coin which is taking place in the United States and France has been hindered by the intervention of government, which has declared, in opposition to all sound principle, that silver only shall be legal tender. The value of the gold that has been consequently liberated in Holland has been estimated at about 172,000,000 florins, most part of which has been absorbed in the new gold currency of France. We may add that the additional quantity of silver required, through the cessation of gold as currency, for the supply of the Dutch mints slightly affected the price of the former, which, however, very soon fell to about its old level.

It would not be safe to lay much stress on any speculations that may be formed in regard to the more extensive employment of gold as money in Austria and Germany. Much depends on the continuance of tranquillity. But if it be preserved, and the government of Austria succeed in withdrawing any considerable amount of paper from circulation, gold will, no doubt, be partially substituted in its stead; and it is all but certain, supposing no measures are taken to prevent it, that eventually gold will supersede silver in all but the smallest payments throughout the great majority of the German states.

A further substitution of gold for silver may probably be effected by using gold coins of less value than formerly. In the United Kingdom, for example, gold might be advantageously coined into 5s. pieces. It would be inconvenient, perhaps, to have gold coins worth less than this; but of this value their employment would be beneficial, as well by economizing the use of silver, as by their being more convenient and easily carried about.

Supposing that the substitution of gold for silver now referred to were fully effected, and that the production of gold as compared with silver were to go on as it has done since the discovery of the Californian and Australian gold-fields, the value of silver, measured in gold, could hardly fail to rise. This, however, would in great measure depend on the demand for silver for the East continuing at about its late average amount, or on its not falling off. And there are but slender grounds for thinking that gold and silver will continue for any considerable period to be produced in the same proportions that they have been during the last ten years. As already seen, the presumption appears to be rather in favour of the future increase of silver than of gold.

Consumption of the Precious Metals.

Estimate by Bank of England of additions made to the bullion of Europe since 1851.

We may perhaps, before proceeding further, notice in this place the following estimate which the Bank of England laid before the committee of the House of Commons on banks in 1857-58:—

Estimated Increase of the European Stock of Bullion in the Seven Years 1851–1857, *both inclusive.*

Years	Imports from Producing Countries.		Exports to the East from Great Britain and the Mediterranean.	
	Gold.	Silver.	Gold.	Silver.
1851...	L.8,654,000	L.4,076,000	L.102,000	L.1,716,000
1852...	15,194,000	4,712,000	922,000	2,630,000
1853...	22,435,000	4,355,000	974,000	5,559,000
1854...	22,077,000	4,199,000	1,222,000	4,583,000
1855..	19,875,000	3,717,000	1,192,000	7,934,000
1856...	21,275,000	4,761,000	479,000	14,108,000
1857...	21,366,000	4,050,000	529,000	20,146,000
Total..	L.130,876,000	L.29,870,000	L.5,420,000	L.56,676,000

GOLD.

The total import of gold in seven years has been, say		L.130,000,000
The exports of gold bullion and British gold coin to India, China, Australia, the Cape, Brazils, the West Indies, United States, &c., may be taken at...		22,500,000
Which would leave as the increase to the European stock of gold		L.107,500,000

SILVER.

The exports of silver to India and China have been	L.56,676,000	
The imports from the producing countries	29,870,000	
Making the amount of silver abstracted from the European stock		26,800,000
And the estimated increase in the European stock of bullion		L.80,700,000

In some respects this estimate might be advantageously modified. But supposing it to be, as it may be presumed it is, nearly accurate, still it is obvious that, to get the total addition made to the stock of European bullion during the seven years ending with 1857, we must add to the addition from importations the bullion produced in Europe during the above period. And the latter being taken at L.1,550,000 a year, makes an aggregate sum of L.10,850,000, which, added to the above balance of L.80,700,000, makes the total increase amount to L.91,550,000.

But, though immense, the demands this fund has had to sustain have been equally immense. We have already seen that the coinage of gold in France during the eight years ending with 1857, amounted to no less than L.109,987,740; and during the seven years ending with 1857, the period referred to in the Bank of England estimate, it amounted to L.87,085,201. A portion of this gigantic sum was derived from Dutch, English, and other European coin imported into France, and very considerable portions have been exported, partly to the Crimea, and thence to the adjacent Asiatic countries, for supplies for the French forces in that quarter, and partly to the East by way of Egypt, Smyrna, &c. Still, however, we feel satisfied that we shall be far within the mark if we assume that France has absorbed L.35,000,000 of new gold, during the period in question, in the shape of coin, which is partly employed as currency, and partly hoarded.[1] And if we be nearly right in this assumption, it follows that only L.56,550,000, or L.8,080,000 a year, remains to supply all Europe,—1*st*,

---

[1] See in confirmation of the statement now made, Levasseur, *La Question de l'Or*, p. 106.

Consumption of the Precious Metals.

with new coins (*ex* France), and to make good the wear and loss of the old coins;[1] 2*d*, To supply the sums required for use in the arts; and 3*d*, To supply those that are hoarded and carried away in the pockets of emigrants, &c. &c.

The last item now referred to is of much more importance than is generally supposed. Taking the entire number of emigrants from Europe to the United States, Australia, and all other places at 400,000 a year, it is pretty certain that they do not take with them, at an average, less than from L.2 to L.3 in coin, besides plate, watches, rings, &c. Some estimates make the exports of bullion by emigrants much greater than this; but even on this very moderate hypothesis it will amount to L.1,000,000 a year in coin only.

Hence, as compared with the outgoings, the supply of bullion in Europe during the last seven or eight years, far from being in excess, has been scanty rather than otherwise. And without a diminution of the former, or an increase of the latter, most people amongst us will be but little sensible of the influence of Californian and Australian gold.

Past and probable future influence of the increased supply of bullion on prices and on its value

The previous statements seem to be sufficient to show that the present supply of the precious metals is not more than adequate to meet the existing demand, and that therefore there is no ground for anticipating a fall in their value unless the supply should be increased or the demand diminished.

It is now ten years since the increased supplies of gold from California, and seven since those from Australia, have been poured into the markets of Europe and America; and yet there has not, during that period, been anything like a general rise of prices. On the contrary, the prices of most articles are as low at this moment (December 1858) as they were at the same time in 1850, while several are a good deal lower. And of the few that have risen in price since the latter epoch, there is not one of which the rise may not be satisfactorily explained by something peculiar to itself, and affecting either its demand or the conditions of its supply, or both. Thus, the rise that has taken place in the rate of wages in Great Britain and in Ireland is wholly ascribable, partly to the greater demand for labour, partly to the extent to which emigration has been carried, and partly to the potato rot and the consequent famine in Ireland. There is, in truth, nothing whatever, in comparing the prices of to-day with those of ten years ago, to entitle any one to affirm that the value of gold and silver has undergone the smallest change in the interval.

It has been attempted to show that gold has fallen in value, by alleging that the value of silver, as compared with it, has increased. But a rise may take place in the comparative value of silver without its being occasioned by a corresponding fall in the valne of gold. The value of silver is affected by a variety of circumstances peculiar to itself; and if it have really increased during the last half dozen years, such increase may be satisfactorily accounted for by the extraordinarily increased demand for it in the East. It is, however, very doubtful whether there has been any rise in the value of silver as compared with gold. We subjoin an account of the price of silver per oz. in London, in the months of March, July, and November annually since 1852, viz.:—

Consumption of the Precious Metals.

	Price per Ounce.		
Years.	March.	July.	November.
1852	$60\frac{1}{8}$d.	$60\frac{1}{4}$d.	$61\frac{7}{8}$d.
1853	$61\frac{3}{8}$	$61\frac{1}{2}$	$61\frac{7}{8}$
1854	$61\frac{7}{8}$	$61\frac{3}{4}$	$61\frac{1}{2}$
1855	$60\frac{7}{8}$	$61\frac{1}{2}$	$60\frac{7}{8}$
1856	60	$61\frac{1}{4}$	$62\frac{1}{8}$
1857	$61\frac{3}{4}$	$61\frac{5}{8}$	$61\frac{1}{2}$
1858	$61\frac{5}{8}$	...	...

It does not appear from this table that the price of silver has risen during these seven years. It appears to have fluctuated much less than might have been anticipated, its extremes being 60 and $62\frac{1}{8}$, making its value, as compared with that of standard gold (at L.3, 17s. 6d. an oz.),[2] as 15·5 to 1, and 14·97 to 1; but at an average of the entire period there has been no sensible variation.

That there is but little probability that prices will be raised by a continuance of the present supplies of gold and silver, may be inferred from what took place after the discovery of America in 1492. It appears from the researches of Adam Smith[3] and other authorities, that the influx of the precious metals had exerted its full effect upon prices previously to or about 1640; and yet this influx was much greater then and subsequently than it had been at any previous period. According to the best information attainable, the average annual importation of the precious metals from America into Europe, from 1492 down to 1810, may be estimated as follows:—

Period	Amount
From 1492 to 1500	L.54,300 a year
„ 1500 „ 1545	651,600 „
„ 1545 „ 1600	2,389,200 „
„ 1600 „ 1700	3,475,200 „
„ 1700 „ 1750	4,887,000 „
„ 1750 „ 1803	7,667,160 „
„ 1803 „ 1810	9,016,920 „

Annual average of the entire period (1492–1810), L.4,109,191.

In 1640 or 1650, when the bullion of America had produced its full effect on prices in Europe, its annual influx amounted to about L.3,000,000. And yet, though its influx was nearly trebled between that epoch and 1803, it is admitted on all hands that, down to the last-mentioned year, there was no general rise of prices.[4] The increased demand of Europe was fully sufficient to take off this great increase of supply without any fall taking place in the value of silver. Indeed, it is contended by some high authorities that, instead of falling, it rose in value during the period referred to.

There can be no manner of doubt, not merely that the quantity of the precious metals employed in Europe and America is incomparably greater now than in the seventeenth and eighteenth centuries, but that the demand for additional quantities is also incomparably greater. And when it is seen that their value continued stationary from 1650 to 1800, despite the immense additional supplies that were thrown upon the market, there is, it is plain, little ground for wonder that their late increase, great as it has been, has not affected their values, or for anticipating that they will materially decline in the course of the next half century.

A fall in the value of the precious metals would, on the whole, be advantageous.

Should it, however, turn out that we are mistaken in these conclusions, and that a considerable fall in the value of the precious metals is about to commence, it is satisfactory to know that there are no really tenable grounds for supposing that such fall will be publicly injurious. It is indeed impossible for any change to take place in the measure of value without its exercising an injurious influence over a greater or less number of individuals. But if the loss it may inflict on A., B., and C. be counteracted by the advantages which it confers on X., Y., and Z., its effect in a public point of view, may not be perceptible. It is easy, however, to see that, in the case now under consideration, the inconveniences resulting from a fall in the value of gold and silver would be a good deal more than compensated by the advantages of which it would be productive.

---

[1] A very considerable addition has been made to the metallic currency of the United Kingdom during the last ten years. Owing, however, to our gold coins being exempted from seignorage, they have no greater value than an equal weight of standard bullion, and are exported indifferently with the latter. Hence the accounts of the sums coined throw, if taken by themselves, little or no light on the increase or diminution of the currency.

[2] The price paid by the bank for standard gold.

[3] *Wealth of Nations*, M'Culloch's edition, 1 vol. 8vo, p. 88.

[4] Prices rose in this country subsequently to 1793; but this was entirely owing to the difficulties which the war that was then commenced threw in the way of importation, the waste of capital, and the shock given to industrial undertakings which it occasioned, and the disorders of all sorts incident to national struggles.

1. In the first place, we may observe that the mischievous influence resulting from a fall in the value of the precious metals depends in great measure on the rapidity with which it is brought about. If it were to take effect suddenly, and without giving any distinct warning of its approach, it would be much more injurious than if it took effect slowly and gradually; for, in the former case, it is difficult to take any measures by which to mitigate or avert the impending evil, whereas, in the latter, abundant opportunities are afforded for that being done; and though these were not availed of, a change that is brought about by a slow and all but insensible progress, is but little felt, at least when compared with one that takes place suddenly or rapidly. Now it is sufficiently certain, supposing the value of the precious metals to be in the end reduced, that that reduction will be a very slow process; and that any one likely to be injuriously affected by its occurrence will have ample time to concert measures to secure himself, in as far as practicable, against its operation. That we are warranted in coming to this conclusion is obvious. When an unprecedented influx of bullion has been going on for ten years without having had any appreciable influence over its value, it would be contradictory to suppose that it is at all likely to be speedily and seriously affected by a continuance of the influx.

2. But supposing that these anticipations should not be realized, and that the supplies of the precious metals should be largely and rapidly increased, and their value reduced, the results are not of a kind that should be deprecated. "In every kingdom," says Hume, "into which money begins to pour in greater abundance than formerly, everything takes a new face: labour and industry gain life, the merchant becomes more enterprising, the manufacturer more diligent and skilful, and even the farmer follows his plough with greater alacrity and attention. But when gold and silver are diminishing, the workman has not the same employment from the manufacturer and merchant, though he pays the same price for everything in the market; the farmer cannot dispose of his corn and cattle, though he must pay the same rent to the landlord: the poverty, beggary, and sloth that must ensue are easily foreseen." (*Essay on Money.*)

Hume appears to have supposed that the stimulus he has so well described, which is given by an influx of money to industry, is occasioned by the additional money coming first into the hands of capitalists, and enabling them to extend their businesses and employ more work-people. But though this would have some influence, the philosophical historian seems to have overlooked the mode in which an increase in the quantity, and a fall in the value of money, principally contributes to excite industry and enterprise. Such fall proportionally diminishes the many fixed money payments that are borne by the industrious classes. The prices of commodities vary with variations in the value of money; whereas taxes, rents, mortgages, and other pecuniary burdens, continue stationary for longer or shorter periods. The latter are rated or specified in certain amounts of money,—those to whom these are due being obliged to receive them in payment, though the value of money should have fallen 5, 10, or even 50 per cent. since the date of the contract or engagement in which the payments originate; while those by whom they are due are bound to pay them, however much the value of money may have risen. Hence the powerful influence of variations in its value over the different classes of society. When it declines, the debtor portion, or those who have fixed money payments to make, are benefited at the expense of the creditor portion, or those who have such payments to receive; and conversely when it rises. Fundholders, annuitants of all sorts, landholders during the currency of the leases of their estates, mortgagers, the army and navy, &c., suffer according to the diminution in the value of money; for, though their incomes and claims continue nominally the same, their value is really reduced, and they no longer have their former command over necessaries and conveniences. But while the farmer pays the same rent for his farm, and the same taxes to government, he sells his produce for a price increased proportionally to the reduced value of money. And while manufacturers, merchants, and tradesmen pay the same duties on their goods, the same port and market dues, the same tolls, the same rent for shops and warehouses, the same rate of interest for capital borrowed, and so on, they obtain increased prices for whatever they have to sell. In other words, the condition of these classes is improved at the expense of their landlords and creditors, and of annuitants, and other receivers of incomes which are either temporarily or permanently reduced through the fall in the value of money. The greater the fall, the more advantageous for them; and conversely.

Now, as fixed or stationary payments include the interest of the public debt, as well as the many outgoings of government which do not readily accomodate themselves to changes in the value of money, with the rents of farms and houses let on lease, or under equivalent agreements, feu-duties, the interest of mortgages, and other stationary loans, the payments to private annuitants and clergymen, the fees of lawyers, physicians, &c., it is obvious that, in a country like this, they must amount in the aggregate to a vast sum. No doubt it sometimes, and indeed not unfrequently happens, that individuals belong to both classes, or that they have fixed payments to receive as well as to make, and that therefore neither the gain to the one party, nor the loss to the other, from fluctuations in the value of money, is so great as might be at first supposed. Still, however, there is no room for doubting that the greater proportion by far of fixed payments is made to the classes not engaged in business or in industrial undertakings by those who are; and hence the advantage which any considerable fall in the value of money confers on the latter,—that is, on those whose well-being, and that of the public, are commonly supposed to be identical. Such fall, by lightening the burden of taxation and of all fixed charges, increases universally the productiveness of industry and the rate of profit. And it is hardly necessary to add that this increased profit operates as a spur to production, that it quickens all the operations of trade, and occasions an increased demand for labour.

The opposite effects follow when, instead of falling, the currency becomes more valuable. Taxes and fixed charges being then augmented in an equal degree, the profits of those by whom they are principally borne are proportionally reduced, industry is depressed, and the situation of the productive classes changed for the worse. But though there cannot, as it appears to us, be a doubt that a fall in the value of money, however injurious to large classes, is on the whole advantageous, we hope it will not be thence inferred that we are disposed to approve in any degree of an intentional reduction of its value. Money being the standard or measure of value, to interfere with it, whether in the way of increase or diminution, would be an act of extreme injustice. Government is bound to protect, in as far as possible, the rights and interests of all classes of its subjects; and it cannot, without trampling on its most sacred duty, adopt, to benefit one part of them, any measure which might be injurious to another part. But a fall in the value of the precious metals caused by the greater facility of their production, or by the discovery of new sources of supply, is a wholly different matter. It depends in no degree on the theories of philosophers or the decisions of statesmen or legislators, but is the result of circumstances that are beyond human control. And though, like a fall of rain after a long course of dry weather, it may be prejudicial to certain classes, it is beneficial to an incomparably greater number, including all who are actively engaged in industrial pursuits; and is, speaking generally, of great public or national advantage.

On the whole, therefore, we are warranted in concluding—1. That there has been no fall in the value of the precious metals, and more especially in that of gold, during the ten years ending with 1857; 2. That there do not appear to be any good grounds for anticipating a speedy or considerable fall in the value either of gold or silver; and 3. That supposing a fall in the value of gold were to take place, its advantageous would much more than countervail its disadvantageous influence. (J. R. M.)

PREDESTINATION, the supposed decrees of God by which he has from all eternity unchangeably appointed whatsoever comes to pass; and has more especially fore-ordained certain individuals of the human race to everlasting happiness, and passed by the rest, and fore-ordained them to everlasting misery. The former of these are called the elect, and the latter are called the reprobate.

This doctrine is the subject of one of the most perplexing controversies that has occurred amongst mankind. But it is not altogether peculiar to the Christian faith. The opinion, that whatever occurs in the world at large, or in the lot of private individuals, is the result of a previous and unalterable arrangement by that Supreme Power which presides over nature, has always been a favourite opinion amongst the vulgar, and has been believed by many speculative men. Thus, in that beautiful scene in the sixth book of the *Iliad*, Hector, taking leave of his wife and child, speaks thus:—

> "Andromache, my soul's far better part,
> Why with untimely sorrows heaves thy heart?
> No hostile hand can antedate my doom,
> Till fate condemns me to the silent tomb.
> Fix'd is the term to all the race of earth,
> And such the hard condition of our birth.
> No force can then resist, no flight can save;
> All sink alike, the fearful and the brave."

The ancient Stoics, Zeno and Chrysippus, whom the Jewish Essenes seem to have followed, asserted the existence of a Deity, that, acting wisely, but necessarily, contrived the general system of the world; from which, by a series of causes, whatever is now done in it unavoidably results. This series, or concatenation of causes, they held to be necessary in every part; and that God himself is so much the servant of necessity, and of his own decrees, that he could not have made the smallest object in the world otherwise than it now is, much less is he able to alter any thing.

According to the words of Seneca,—"The same chain of necessity constrains both gods and men. Its unalterable course regulates divine as well as human things. Even he who wrote the Fates, the Maker and Governor of all things, submits to them. He did but once command, but he always obeys." The stoical fate, however, differs from the Christian predestination in several points. The Stoics regarded the divine nature and will as a necessary part of a necessary chain of causes; whereas the Christians consider the Deity as the lord and ruler of the Universe, omnipotent and free, appointing all things according to his pleasure. Being doubtful of the immortality of the soul, the Stoics could have no idea of the doctrine of election and reprobation; nor did they ever doubt their own freedom of will, or power of doing good as well as evil, as we shall presently see the Christian predestinarians have done.

Mohammed introduced into his Koran the doctrine of an absolute predestination of the course of human affairs. He represented life and death, prosperity and adversity, and every event that befalls a man in this world, as the result of a previous determination of the one God who rules over all; and he found this opinion the best engine for inspiring his followers with that contempt of danger, which, united to their zeal, has extended the empire of their faith over the fairest portion of the habitable globe.

The controversy concerning predestination first made its appearance in the Christian church about the beginning of the fifth century. Pelagius a British, and Cœlestius an Irish monk, both lived at Rome during that period, and possessed great celebrity on account of their piety and learning. They taught that the opinion is false which asserts, that human nature is necessarily corrupted by a depravity derived from our first parents. They contended that men are born at present in a state as pure as that in which Adam was originally created; and that they are not less qualified than he was for fulfilling all righteousness, and for reaching the most sublime eminence of piety and virtue. They maintained that the external grace of God, which is given unto all, and attends the preaching of the gospel, is necessary to call forth the attention and the exertions of men; but that we do not want the assistance of any internal grace to purify the heart, and to give it the first impulse towards what is good. Having fled into Africa on account of the Goths, who at that time (A.D. 410) invaded Italy, Cœlestius remained at Carthage as a presbyter; but Pelagius went into the East, where he settled, and prospered under the patronage of John, Bishop of Jerusalem, to whom his sentiments were agreeable. On the contrary, the celebrated Augustin, Bishop of Hippo, strenuously asserted the depravity of human nature since the fall of the first man, the necessity of a special interposition of divine grace to enable us to do any one good action; and consequently, that none could obtain salvation excepting those whom God has thought fit to elect, and upon whom he bestows this grace. The dispute was carried on with great zeal. Zozimus, Bishop of Rome, decided at first in favour of Pelagius and Cœlestius, whose followers were called *Pelagians;* but he afterwards altered his opinion, and by the activity of Augustin, the council of Ephesus was called, at which the opinion of his antagonists was formally condemned.

In the course of the same century these opinions assumed a variety of forms and modifications. One party, called *Predestinarians*, carried Augustin's doctrine fully farther than he himself had ventured to do in express words; and asserted that God had not only predestinated the wicked to punishment, but also that he had decreed that they should commit those very sins on account of which they are hereafter to be punished. Another party moderated the doctrine of Pelagius, and were called *Semipelagians*. Their peculiar opinion is expressed in a different manner by different writers; but all the accounts sufficiently agree. Thus, some represent them as maintaining that inward grace is not necessary to the first beginning of repentance, but only to our progress in virtue. Others say that they acknowledged the power of grace, but said that faith depends upon ourselves, and good works upon God; and it is agreed upon all hands that these Semipelagians held that predestination is made upon the foresight of good works. The assistance of Augustin, though then far advanced in life, was called in to combat these tenets, and he wrote several treatises upon the subject. In all these he strenuously maintained that the predestination of the elect was independent of any foresight of their good works, but was according to the good pleasure of God only; and that perseverance comes from God and not from man. Thereafter the doctrine of St Augustin, as he is often called, became general. He was the oracle of the schoolmen. They never ventured to differ from him in sentiment; they only pretended to dispute about the true sense of his writings.

The whole of the earliest Reformers maintained these opinions of Augustin. They assumed, under Luther, a more regular and systematic form than they had ever formerly exhibited. But as the Lutherans afterwards abandoned them, they are now known by the name of *Calvinistic Doctrines*, from John Calvin of Geneva. This reformer asserted, that the everlasting condition of mankind in a future world was determined from all eternity by the unchangeable decree of the Deity, arising from his sole good pleasure or free will. Being a man of great ability, industry, and eloquence, Geneva, where he taught, and which was a free state, soon became the resort of a very large number of the men of letters belonging to the Reformed churches, and was a kind of seminary from which missionaries issued to propagate the Protestant doctrine throughout Europe. Their success was such that, excepting a small part of Germany, the principles of all the Reformed churches are professedly Calvinistic or Predestinarian.

The opponents of the doctrine of predestination among the Protestants usually receive the appellation of *Arminians* or *Remonstrants.* They derive the first of these appellations from James Arminius, who, in 1602, was appointed professor of theology at Leyden. (*Relatio Historica de Origine et Progressu Controversiarum in fœderato Belgio de Prædestinatione* Philippi à Limborch.) He was violently opposed by Gomer his colleague, and he died in 1609. After his death, the controversy was conducted with great eagerness on both sides. The Calvinists, however, gradually prevailed. A synod was called at Dort, in 1618, to which the most celebrated divines of different countries were invited. There, in a great measure, by the authority and influence of Maurice, Prince of Orange, the Arminians were condemned as heretics; for by this time ambitious and powerful men found themselves politically interested in this religious contest. The Arminians presented to this synod a remonstrance, containing a statement of their faith upon the subjects in dispute; and from this they derived the appellation of *Remonstrants.* This statement contained the following five articles:—1. That God from all eternity predestinated those to everlasting salvation whom he foresaw would believe in Christ unto the end of their lives, and predestinated obstinate unbelievers to everlasting punishment. 2. Jesus Christ died for the whole human race, and for every individual of it, but believers alone reap the benefit of his death. 3. No man can produce faith in his mind by his own free-will, but it is necessary that man, who is by nature wicked and unfit for acting or thinking aright, should be regenerated by the grace of the Holy Spirit, imparted by God for Christ's sake. 4. This divine grace constitutes the source, the progress, and the fulfilment, of all that is good in man, but it is not irresistible in its operation. 5. Believers, by the assistance of the Holy Spirit, are abundantly fitted for every good work; but whether it is possible for those who have once been truly such to fall away, and to perish finally, is not clear, and must be better inquired into by searching the sacred Scriptures.

In opposition to these, a counter remonstrance was presented, containing the opinions of the Calvinists, which was approved of by the synod. The substance of it was afterwards adopted, and in nearly the same expressions, into the *Confession of Faith* compiled by the assembly of divines which met at Westminster in 1643, and which every clergyman and probationer for the ministry in Scotland is at present required to subscribe previous to his admission. To give as clear and fair an idea as possible of the Calvinistic doctrine upon this head we transcribe the following passage from that Confession:—" God from all eternity did, by the most wise and holy counsel of his own will, freely and unchangeably ordain whatsoever comes to pass; yet so, as thereby neither is God the author of sin, nor is violence offered to the will of the creatures, nor is the liberty or contingencies of second causes taken away, but rather established. Although God knows whatsoever may or can come to pass upon all supposed conditions; yet hath he not decreed anything because he foresaw it as future, or that which would come to pass upon such conditions. By the decree of God, for the manifestation of his glory, some men and angels are predestinated unto everlasting life, and others are foreordained to everlasting death. These angels and men, thus predestinated and foreordained, are particularly and unchangeably designed; and their number is so certain and definite that it cannot be either increased or diminished. Those of mankind that are predestinated unto life, God, before the foundation of the world was laid, according to his eternal and immutable purpose, and the secret counsel and good pleasure of his will, hath chosen, in Christ, unto everlasting glory, out of his mere free grace and love, without any foresight or faith, or good works, or perseverance in either of them, or any other thing in the creature, as conditions or causes moving him thereunto; and all to the praise of his glorious grace. As God hath appointed the elect unto glory, so hath he, by the eternal and most free purpose of his will, foreordained all the means thereunto. Wherefore, they who are elected, being fallen in Adam, are redeemed by Christ, are effectually called unto faith in Christ, by his spirit working in due season; are justified, adopted, sanctified, and kept, by his power through faith unto salvation. Neither are any other redeemed by Christ effectually called, justified, adopted, sanctified, and saved, but the elect only. The rest of mankind, God was pleased, according to the unsearchable counsel of his own will, whereby he extendeth or withholdeth mercy as he pleaseth for the glory of his sovereign power over his creatures, to pass by, and to ordain them to dishonour and wrath for their sin, to the praise of his glorious justice."

There are two kinds of Calvinists or Predestinarians, viz.:—the *Supralapsarians*, who maintained that God did originally and expressly decree the fall of Adam as a foundation for the display of his justice and mercy; whilst they who maintain that God only *permitted* the fall of Adam, are called *Sublapsarians*, their system of decrees concerning election and reprobation being, as it were, subsequent to that event. But, as Dr Priestley justly remarks, if we admit the Divine prescience, there is not, in fact, any difference between the two schemes; and accordingly that distinction is now seldom mentioned.

Nor was the Church of Rome less agitated by the contest about predestination than were the first Protestants. The council of Trent was much perplexed how to settle the matter without giving offence to the Dominicans, who were much attached to the doctrine of St Augustin, and possessed great influence in the council. After much dispute, the main object came to be, how to contrive such a decree as might give offence to nobody, although it should decide nothing. Upon the whole, however, they seem to have favoured the Semipelagian scheme. Amongst other things, it was determined that good works are of themselves meritorious to eternal life; but it is added, by way of softening, that it is through the goodness of God that He makes His own gifts to be merits in us. Catarin revived at that council an opinion of some of the schoolmen, that God chose a small number of persons, such as the blessed Virgin, the apostles, and others, whom He was determined to save without any foresight of their good works; and that He also wills that all the rest should be saved, providing for them all necessary means, but they are at liberty to use them or not. This is called the *Baxterian* scheme in England, from one of its promoters there. But at all events, the Council of Trent seems to have been extremely anxious that any opinions entertained amongst them concerning predestination might have as little influence as possible upon practical morality. "Let no man," say they, "whilst he remains in this mortal state, presume that he is among the number of the elect, and that therefore he cannot sin, or sin without repentance; for it cannot be known who are elected without a special revelation from God." (Sect. vi., c. 13.)

The Jesuits at first followed the opinion of St Augustin; but they afterwards forsook it. Molina, one of their order, was the author of what is called the *middle scheme*, or the doctrine of *a grace sufficient for all men*, but subject to the freedom of the human will. Jansenius, a doctor of Louvain, opposed the Jesuits with great vigour, and supported the doctrine of St Augustin. He wrote in a very artful manner, declaring that he did not presume to state his own sentiments upon the subject. He pretended only to explain and publish the sentiments of that great father of the church St Augustin. But the Jesuits, in consequence of that inviolable submission to the authority of the Pope which they always maintained, had sufficient interest at Rome to procure the condemnation of the opinion of Jansenius; with this addition subjoined, however, that nothing was thereby intended to be done in prejudice of the doctrine of St Augustin. This produced an absurd dispute about the Pope's infallibility in matters of fact. The Jansenists affirmed that the Pope had made a mistake in condemning the opinions of Jansenius as different from those of St Augustin, whereas in truth they are the same, and the one cannot be condemned without the other; but the Jesuits affirmed that the Pope is no less infallible in points of fact than he is in questions of faith, and he, having decided that the opinions of Jansenius are different from those of St Augustin, every good Catholic is bound to believe accordingly that they are different. Some of the ablest supporters of predestination have appeared amongst the Jansenists, and particularly amongst the gentlemen of Port-Royal.

With regard to Great Britain, the earliest English Reformers were in general Sublapsarian, although some of them were Supralapsarians. But the rigid Predestinarians have been gradually declining in number in that church, although they still subscribe the Thirty-Nine Articles of their faith, which are unquestionably Calvinistic. The celebrated Scotch Reformer John Knox, having been educated at Geneva, established in this country the doctrine of predestination in its strictest form; and it has probably been adhered to with more strictness in Scotland than in any country in Europe.

Concerning this and many other theological questions men will continue to vex themselves; and until they will devise some means of explaining how the finite and the infinite are related, there is positively no hope of a solution to such difficulties. Such an explanation may safely be asserted to be impossible to man, and hence he must rest contented with the little knowledge which is within his reach. Questions such as predestination are entirely out of the sphere of his faculties of knowing—however vital to his faith,—because one of the relations of knowledge always implies an apprehension of the infinite.

PREDICATE. See LOGIC.

PREEZ, or PREETZ, a market-town of Denmark, in the duchy of Holstein, on the Schwentine, at the foot of a small lake 8 miles E.S.E. of Kiel. Its principal building is the convent, founded in 1216, to which the town owes its origin, and which is now an establishment for unmarried ladies of noble birth. It is connected with the town by a shady walk, and contains a fine church and cloisters. Pop. 4750.

PREMIUM. See INSURANCE.

PREMONSTRATENSIANS, a religious order of regular canons instituted in 1120 by St Norbert, and thence called *Norbertines.* The first monastery of this order was built by Norbert in the Isle of France, three leagues to the west of Laon, which he called *Præmonstratum;* and hence the order itself derived its name, though as to the occasion of the name the writers of the order are divided. At first the religious of this order were so very poor that they had only a single ass, which served to carry the wood they cut down every morning, and was sent to Laon for the bread purchased. But they soon received so many donations, and built so many monasteries, that in 30 years after the foundation of the order, they had above 100 abbeys in France and Germany; and in process of time the order so increased that it had monasteries in all parts of Christendom, amounting to 1000 abbeys, 300 provostships, a vast number of priories, and 500 nunneries; but they are now greatly diminished. The rule they followed was that of St Augustin, with some slight alterations, and an addition of certain severe laws, the authority of which did not long survive their founder. The order was approved by Honorius II. in 1126, and again by several succeeding Popes. At first the abstinence from flesh was rigidly observed. In 1245 Innocent VI. complained of its being neglected to a general chapter. In 1288 their general, William, procured leave of Pope Nicholas IV. for those of the order to eat flesh upon journeys. In 1460 Pius II. granted them a general permission to eat meat, excepting from Septuagesima to Easter. The dress of the religious of this order was white, with a scapulary before the cassock.

The Præmonstratenses, or monks of Premontre, vulgarly called *white canons*, came first into England in the year 1146. Their first monastery, called *New-house,* was erected in Lincolnshire by Peter de Saulia, and dedicated to St Martial. In the reign of Edward I. this order had 27 monasteries in England, and in Henry VIII.'s time they had 35.

PRENZLOW, or PRENZLAU, a town of Prussia, in the province of Brandenburg, on the Ucker, at the foot of the lake of the same name, from which it issues, 57 miles N.N.E. of Berlin. Of its seven churches, the most important is that of St Mary, a Gothic building with two towers, containing a fine altar-piece by Rode. There is also here a gymnasium, several hospitals, and mineral baths. Woollen, linen, and cotton fabrics; straw-hats, leather, tobacco, &c., are manufactured here; and an active trade is carried on in corn. In 1806, 20,000 Prussians, under the Prince of Hohenlohe, surrendered to the French at Prenzlow. The celebrated landscape-painter Philip Hackert was born here. Pop. 12,973.

PRESBYTERIANISM.

Definition.

Presbyterianism[1] is that form of ecclesiastical polity according to which the chief power is vested in a court of presbyters. A church recognising as its government a body of presbyters, whose office includes the twofold function of teaching and ruling, is commonly designated Presbyterian, although the system which bears this name has been variously modified in its development according to events in the history of the nation, or of the religious community adopting it. But under every form which it has assumed, Presbytery has its points of vital difference from every other kind of ecclesiastical rule with which it competes. These by a common analysis have been reduced to three, if we exclude the Erastian theory on the one hand, according to which the state, identifying itself with the church, may avail itself of any species of government over it; and the Romish system on the other, according to which, as prelates take the place of the apostles, so the Roman pontiff, succeeding to Peter in his alleged primacy, becomes the vicar of our Lord upon the earth. The latter, indeed, if we except the claim to universal supremacy and infallibility, and if we view it simply as the subjection of bishops to the jurisdiction of a superior, is a species of Episcopacy, not without its analogies beyond the pale of the Romish Church both in ancient and modern times. But if we regard Episcopacy and Independency as the two other main forms of ecclesiastical government, Presbytery differs from the former in refusing to acknowledge any such succession to the apostleship on the part of bishops as would constitute them an office separate from and superior to presbyters; and from Independency, in claiming for presbyters the official authority which it lodges in the common membership of the church, and in asserting such a connection between the different congregations of a church as renders them amenable to a common jurisdiction.

Theory of Presbyterianism.

Theory.

Three elements exist in the Presbyterian system,—the authority of the presbyters, more especially as subordinate to no office-bearer of higher rank in the church; the representation of the laity in its government; and the provision made for its external unity in courts of review.

The authority of the presbyter.

I. In regard to the *authority* claimed for the presbyter: 1. It is of *divine appointment*, not merely in so far as the office itself, from the official titles bestowed upon those exercising it, from the official qualifications demanded of them, and from the recognition of their official dignity enjoined in Scripture, is a divine institute, but inasmuch as they derive their power, not from the people, but from Christ as the Head of the church.[2] Proceeding upon such facts as, that the people have received no commission to exercise ecclesiastical power, but a command to obey it, and accordingly cannot convey what they themselves have not received; and that the rulers of the church are described as the gift of Christ, and occupy a special relation to him as his messengers and ambassadors, Presbyterians generally maintain that the official authority of the presbyter directly emanates from Christ, though the call to exercise it comes through the channel of the people. In this respect, obedience to ecclesiastical rule is enforced upon the conscience by the highest spiritual sanctions,—as an arrangement not springing from mere expediency, but expressly appointed by God.

2. The office of the presbyter is *distinct* and *peculiar*. It is not competent for every member of the church to assume at his pleasure the functions either of teaching or of ruling in the church. From the peculiar gifts requisite; from the special forms by which in the primitive church men were set apart to the office; from the distinction so often traced between those who bore rule in it and those who owned subjection to them; from the importance of the work, as comprehending the preaching of the gospel, the administration of sacraments, and the maintenance of discipline; and from the names which the rulers of the church receive in Scripture,—it is argued that the presbyterate is not a work merely which any man may take upon him to perform as he deems himself competent for it, but an office to be exercised only by men specially called and ordained to it. Presbyterians accordingly agree with Episcopalians in denying that the private members of the church have a right to share directly in the government of it. Some of the arguments employed to this effect are to be found in the article Episcopacy.

3. The authority of the presbyter is entirely *ministerial*. His office, whatever sacredness it may possess as the direct institute of God, and however clearly discriminated from the ordinary privileges enjoyed by every member of the church, is at the same time under restrictions which, fairly observed, would effectually preclude spiritual despotism. The administration of elders is only binding so far as it accords with the rules prescribed in Scripture, which, by defining, limits their authority, while by the same principle it secures the rights of the individual conscience, as subject to Christ, its only Lord. The considerations by which this view of the office is sustained are founded on those statements of Scripture which expound the duties connected with it. The apostles, the highest office-bearers ever known in the Christian church, represent themselves as the servants of Christ, entitled to obedience only as they acted under his instructions, and without any claim to "dominion" over the faith of the church. (2 Cor. i. 24.) More especially in regard to Presbyters, the injunction is given, that they should act not as "lords over God's heritage, but examples to the flock." The power to regulate ecclesiastical proceedings and religious worship, so as to prevent confusion on points where no express rule is prescribed, may be regarded as vouchsafed to them under the general precept, that all things should be done "decently and in order." Presbyterians, however, protest against the notion, that the church has any authority to institute new rites and ceremonies for which no warrant from Scripture can be adduced. Even in the highest exercise of their authority, when assembled as a judicatory, and called to issue decisions on matters of faith, the rulers of the church can exercise only a ministerial function: "It belongeth to synods and councils *ministerially* to determine controversies of faith and cases of conscience." (Westminster *Confession of Faith*, xxxi. 3.)

4. The duration of the office must correspond with the existence of the church that needs its services; in other words, it is *perpetual*. It is not, like the apostleship of the new, or the prophetic order under the old dispensation,

---

[1] Under this article are comprehended notices of the various Presbyterian churches formerly dispersed throughout this work under the initial letters of their designations. The notice of the United Presbyterian Church is the article Seceders of the last, remodelled and abridged for the present edition by the author, the Rev. James Taylor, D.D., Glasgow.

[2] See *Divine Right of Church Government*, by London Ministers, chap. x.

instituted in provision for a special emergency or condition of the church. The instructions bequeathed in inspired epistles for the guidance of presbyters imply the permanence of their office to the end of time. No intimation occurs that the presbyterate is ever to cease; whereas the requirement by which it was essential to the office of an apostle that he should have "seen the Lord," involved obviously its discontinuance when the generation of his contemporaries should have passed away. The very ends for which the Christian church exists require a commissioned agency for the due accomplishment of them. The government and spiritual edification of its members, together with the obligation resting upon it to seek the conversion of all beyond its pale, involve labours too important to be left merely to the waywardness of private zeal. A special agency destined to continue so long as the necessity for it exists, is required for the work. Directions, moreover, are expressly given respecting the qualifications which the presbyter must possess, and the method by which he must be ordained, in such terms as imply the permanence of his office in the church.

5. Finally, according to the Presbyterian system, the presbyterate is *the highest standing office* in the church. This position, of course, is in collison with the distinctive principle of Episcopacy, which asserts that the bishop is an ecclesiastical functionary not merely of a different order, but of a higher grade as compared with the presbyter, and that it is exclusively the prerogative of the former to govern and to ordain. On the contrary, Presbyterians hold that the distinction between bishop and presbyter is invalid; that by their commission all ministers are equal in official rank and authority, and that the ultimate appeal in cases of dispute and discipline must be made, not to the single president of a diocese, but to a court of presbyters. In support of this view, they have been accustomed to show that the grounds on which the claim of the bishop to a separate and superior office is maintained are without weight, that the identity of the bishop and presbyter is clearly recognised in Scripture, and that the rise of diocesan Episcopacy can be historically traced on patristic testimony to no divine and apostolical appointment, but to usages which were engrafted on the primitive simplicity of the church.

No scriptural warrant for an episcopal order

There are five leading arguments urged in support of Episcopacy, the cogency of which the Presbyterian feels that he cannot acknowledge. The appeal made to *the analogy* of the Jewish hierarchy in support of a threefold order in the ministry, may be met by the reply, that the alleged analogy has no foundation in Scripture; that the New Testament never speaks of the rulers of the church as a priesthood, but as a ministry; and that such predictions as are contained in Ps. cxxxii. 16, Is. lxvi. 21, and Jer. xxxiii. 18, even though proved to intimate the blessings which the church would enjoy under the Christian dispensation, come far short of announcing that a threefold hierarchy would exist in it. The typical language employed in such predictions no more proves that priests, in the proper sense of the term, are to officiate in the new economy, than that burnt-offerings are to be presented in it; while all the passages usually quoted from prophecy in support of the parallel between the temple priesthood and the Christian ministry may refer to no office higher than the ordinary priesthood, the antitype of which may be found in the presbyter. Moreover, not merely is it destitute of a scriptural warrant; the analogy fails either by excess or defect. It proves too much if we assume as true the premises of the syllogism, as it would involve the supremacy of a single head in correspondence with the high priest over the whole church, not a body of prelates enjoying an independent jurisdiction. But it is in truth extremely defective; for of the three alleged grades in official dignity, the high priest did not belong to an order distinct from the priests, while the Levites, in no sense, were invested with sacred orders. Not more conclusive is the argument founded on *the distinction* between *the twelve apostles and seventy disciples*, for the latter discharged only a temporary service; and at the best two orders only would thus be established, unless, in despair of otherwise vindicating the analogy, the Episcopalian is prepared to maintain that the Lord himself represented the episcopal order,—a hypothesis the reverse of advantage to those who urge it; for if we overcome our repugnance to the presumption which it seems to breathe, and concede for the moment its validity, it follows that, as our Lord has never abdicated his office, the Episcopal order must be confined to his own person still. Nor are the *functions exercised by Timothy and Titus as evangelists* any foundation for the belief that a permanent office superior to presbyters should now be recognised. Timothy is expressly declared to have been an evangelist, while Titus, from the analogous work he performed, held the same status. They are never described as bishops respectively of Ephesus and Crete; their continual journeyings from place to place are inconsistent with the idea of a resident bishopric; they did nothing for which a presbyter, especially on the high authorization of an apostle, was incompetent; the injunction given to ordain elders does not absolutely imply that they were to do it alone without other presbyters, while, if they did it alone, because no presbyters previously existed in the place, it was an extraordinary conjuncture, yielding no precedent in ordinary circumstances, and but a specimen of the prerogative which a presbyter in every similar conjuncture may exercise; the reference that the apostle makes to the gift which Timothy had received through "the laying on of the hands of the presbytery," is inconsistent with the belief that he had received ordination to a higher dignity,—episcopal consecration to the episcopal order, for in this case the appeal would surely have been made, not to the lower, but to the higher ordination; and lastly, if it be inferred that he must have been superior to presbyters in virtue of a permanent office and not of a special commission, because he was to instruct presbyters, it would follow that Paul held a higher office than Timothy, who took instructions from him, and that Timothy as a bishop was no successor of the apostles, although the succession of the bishops to the apostleship, in respect of jurisdiction, is a main plea in favour of Episcopacy. Great stress cannot be laid on the argument from the *apocalyptic angel.* The precise functionary referred to cannot be easily determined, opinions varying on the point, from that of De Wette, who understands by the term "the guardian angel of the community," down to that of Ewald, who understands by it an official no higher than a clerk or sexton; the most plausible method of fixing the nature of the office intended is the analogy drawn by Vitringa, Bengel, and Delitzch, in virtue of the name "angel," from the presiding officer in the Jewish synagogue, whose chief duty was to conduct public devotion, and whose office, therefore, corresponded more with that of a presbyter than of a diocesan bishop. When it is argued that, since the term is singular, and many churches must have existed in these cities, each church having its separate presbyter, it must therefore denote an officer enjoying a common relation to all those churches and superintendence over all those presbyters; it is urged in reply, that, even considering an individual to be meant, we may regard him as the moderator in the court of presbyters; that the word "angel" may refer to a collective body,—"the consessus, or order of presbyters," as even Stillingfleet supposes,—for since they are declared to be the "stars" giving light to these churches, surely the presbyters, as well as any diocesan bishop, subserved this purpose, and the same term "angel" is obviously employed under a similar collective signification in Rev. xiv. 6, where it must denote the whole body of officers commissioned to preach the gospel; and that nothing occurs in all that is said of these angels attributing to them a rank and power above the presbyter. But the defence of Episcopacy is sometimes chiefly based on an alleged *succession from the apostles.* To state the argument fairly, it is not contended that, in respect of miraculous gifts, bishops could represent the apostles after the age of miracles had closed, but in four different respects,—the power of ordination, the exercise of rule, the preaching of the Word, and the administration of the sacraments,—the official functions and dignity of the apostleship might be transmitted to bishops. Now, in disposing of this crowning plea for Episcopacy, Presbyterians submit various considerations which may in substance be included under four positions,—*First*, in the apostleship viewed as a whole, qualifications are discovered so peculiar as to forbid any reference to it as the prototype of the episcopal order in the primitive church, for it was required of an apostle that he should have seen the Lord, possess the gift of inspiration, and have power to work miracles. These qualifications did not constitute him an apostle, for they might have been predicated respectively of several private members of the church; as, for instance, "of the five hundred brethren at once" who saw Christ, of Philip the evangelist, who wrought miracles, and of his daughters, who were inspired to prophesy. But without such qualifications he could not be an apostle; and accordingly an office to which they were essential is absolutely intransmissible. *Secondly*, Even in the functions common to an apostle with any successor, there was a peculiarity which bars appeal to the former as a precedent for Episcopacy; in preaching, the apostles spoke with the authority of inspiration, in ruling and ordaining they acted by commandment from the Lord, and more especially in all they did they sustained a relation, not to a diocese, but to the world. *Thirdly*, Separate the ordinary functions of their office from this peculiar element attaching to it, and there is nothing in them which a presbyter, according to Scripture, may not perform. Presbyters preached, governed, dispensed the sacraments, and, as in the case of Timothy, ordained. *Lastly*, If bishops are the substitutes for infallible apostles, submission to their authority must be essential to salvation. One apostle tell us, "He is not of God who heareth not us." If there be no salvation beyond the pale of Episcopal jurisdiction, neither can there be any faith, any holiness, any true religion. A theory must be erroneous which, by logical necessity, involves a conclusion at variance with the facts of history and observation as well as the dictates of Christian charity.

The identity of bishop and presbyter.

On such grounds, Presbyterians contend that no office corresponding to a diocesan bishopric has the sanction of Scripture. They go further, and maintain that there is the clearest evidence of the identity of the bishop with the presbyter in the apostolic church. For, in the first place, the titles of presbyter and bishop are used indiscriminately and convertibly in reference to the same persons. Thus, in Acts xx. 17–28, the "elders" whom Paul sent for to Miletus, are addressed by him as "bishops;" and among the qualities required of "the *presbyters*" whom Titus, under the instructions of the same apostle, was to ordain, it is said "a *bishop* must be blameless." (Tit. i. 5–7.) This convertibility of the two terms continued, according to Neander, till far on in the second century. Reference also is made (Phil. i. 1) to "bishops and deacons." Unless in this salutation to the bishops presbyters are addressed, how are we to explain the omission of the intermediate office, while a plurality of "bishops" in one church is incompatible with the idea that any diocesan jurisdiction belonged to each? In the epistles of Clemens Romanus, the same enumeration of but two offices in the church occurs. To the same effect is another argument, that the office-bearer who receives the name ἐπίσκοπος in Scripture is uniformly represented as superintending, not presbyters, but the congregation; "take heed to all the *flock* over which the Holy Ghost hath made you *bishops* (ἐπισκόπους)." (Acts xx. 28; 1 Pet. v. 2, 3.) Moreover, the same qualifications are exacted both of bishops and presbyters. It is only needful to compare 1 Tim. iii. 2–7 with Tit. i. 6–10, in order to feel persuaded that the apostle speaks of the same office under the title bishop in the former case, and presbyter in the latter; and hence the reasoning of Jerome (*Ep.* 83, *ad Oceanum*); "in both epistles, whether bishops or presbyters (although among the ancients *bishops and presbyters must have been the same*, for the one name is expressive of rank, and the other of age), the husbands of one wife are required to be chosen to the sacred office." In the apostolic church bishops and presbyters had a common ordination (Acts xx. 17–28; Tit. i. 5–7). Their duties, too, are identical; the terms expressive of the highest rule being applied to the presbyters (Heb. xiii. 7, 17; 1 Thess. v. 12; Acts xx. 28); while not only did they administer the ordinances of the church, but they occupied a place in its highest councils (Acts xv. 23). Nor is it difficult to prove that presbyters in the church of the apostles had full power to ordain. Nowhere in the manifold directions given to presbyters does a single inhibition occur against the exercise of this right. There is nothing in the nature of it on account of which presbyters should be deprived of it. The employment of six different terms in the New Testament to express ordination is inconsistent with the supposition that it denotes anything more than simply setting apart to official duty, or that it is an act so very peculiar as to require a particular and superior office in order to its performance. To adduce instances in which apostles and evangelists ordained, is not to prove that presbyters were prohibited from doing so; while in the case of Apollos (Acts xviii. 27), and even of Paul himself, whether at Damascus or at Antioch, no trace whatever of a diocesan bishop appears as the source of the official commissions which on these occasions they received. But the ordination of Timothy is directly traced to the court of the presbyters. (1 Tim. iv. 14.) Calvin, at first doubtful as to the import of the term "presbytery," and disposed in his *Institutions* to leave it uncertain whether it denoted an office or a court, comes ultimately, in his commentary on the passage, to a decided conclusion in favour of the latter meaning. Should it signify an office, and if we are to read in connection "the gift of the presbyterial office," it destroys the argument for Episcopacy from the functions of Timothy. He was after all a presbyter and no bishop. But it is an admitted canon in exegesis that we must interpret any term according to the analogy of the other instances in which it occurs. "Presbytery" never signifies an office; twice elsewhere it signifies a council. Its application to presbyters in their associated capacity is therefore perfectly natural and legitimate. It might be added that, by several incidental allusions, yielding inferences not less strong because indirect, the character and authority of the presbyterial office as supreme and permanent are strikingly confirmed: no bishops are mentioned in connection with the council at Jerusalem; collections for the poor in that city are transmitted not to bishops, but to "presbyters;" and apostles, when they indicate their status in regard to the common standing offices of the church, deem it an honour to be enrolled in the rank of presbyters. (1 Pet. v. 2.)

Rise of Episcopacy.

Presbyterians do not shrink from the admission, that diocesan Episcopacy began early, spread rapidly, and seems to have obtained general prevalence before the civil establishment of Christianity in the Roman empire. Before the expiration of the apostolic period, a much more serious departure from the simple order and purity of the primitive church was noticed and denounced both by Paul and John (2 Thess. ii. 7; 1 John iv. 3). It is not so very wonderful, therefore, that, as regards this part of ecclesiastical polity, the craving for pre-eminence, so natural to the hu-

Theory.

man bosom, should have speedily suggested and introduced innovations upon the original parity of the eldership. Meeting occasionally for deliberation on the interests of the several churches within a city or province, the presbyters would adopt the mode common to all assemblies of securing order by appointing a president. Talent, weight of character, and mature experience, would be the gifts likely to determine their choice. Successful presidency in one meeting might establish a claim to re-election in subsequent meetings, till elevation to the chair on such occasions become a dignity for a lifetime. Other elements came into play as the church pursued its course of degeneracy: ambition tempted the clergy to swell by adventitious pomp the importance of their office; the claim to priesthood was preferred; and ecclesiastical arrangements took shape from the gradation of offices which the Jewish Church seemed to exhibit, and from the difference of rank in the cities where a pastorate was exercised, till the whole system, beginning with parochial episcopacy as the first step, was completely developed in the spiritual monarchy of Rome.

Nor is this explanation of the rise of Episcopacy reckoned a mere theory by the friends of Presbytery. It rests, in their judgment, upon authenticated facts and the testimony of the early fathers. Passages could be cited from several fathers, and from the decrees of councils, from which it is undeniable that the episcopate could not have originally extended beyond one church. In a single territory of small extent, so many bishops are represented as labouring and teaching, that their jurisdiction could not have exceeded the limits of a parish; for in Africa alone, according to Du Pin, 690 bishoprics are specified in ancient documents; and some bishops had nothing more as their diocese than a small village, a single fortress, or a solitary monastery, or cities even where no Christians at all permanently resided. Upon this humble rudiment of ecclesiastical authority, the higher pretensions and wider rule of prelatic supremacy were established. Presbyterians appeal to Augustine and Hilary in support of their views, but more especially to Jerome in his commentaries on Titus i. 5. The following is an analytic review of the contents of the important statement which that learned father makes:—“1. Jerome expressly denies the superiority of bishops to presbyters by *divine right*. To prove his assertion on this head, he goes directly to the Scriptures, and argues, as the advocates of parity do, from the interchangeable *titles* of bishop and presbyter; from the *directions* given to them, without the least intimation of difference in their authority; and from the *powers* of presbyters, undisputed in his day. 2. Jerome states it as an *historical fact*, that this government, by *presbyters alone*, continued until, for the avoiding of scandalous quarrels and divisions, it was thought expedient to alter it. 3. Jerome states it as a *historical* fact, that this change in the government of the church, this creation of a superior order of ministers, took place not at once, but *by degrees*—‘*paulatim*,’ says he, ‘little by little.’ 4. Jerome states as *historical facts*, that the elevation of one presbyter over the others was a *human contrivance;* was not imposed by authority, but crept in by custom; and that the presbyters of his day knew this very well. 5. Jerome states it as a *historical fact*, that the first bishops were made by the *presbyters themselves*, and consequently they could neither have nor communicate any authority above that of presbyters.” (See Dr Mason's *Works*, vol. iii.) The words of Jerome are very pointed when he urges the antithesis between the origin of the episcopate and those ordinances, the divine authority of which was not questioned; he opposes the “consuetudo ecclesiæ” to “dispositionis dominicæ veritas”—the custom of the church to a real enactment of our Lord. It is a weighty circumstance, moreover, not to be overlooked, that in his reasoning he does not found upon any individual opinion of his own, but upon facts of which he speaks as universally admitted and beyond denial.

To meet this remarkable corroboration of the Presbyterian theory respecting the origin of Episcopal jurisdiction, three arguments have been commonly advanced by the defenders of Episcopacy,—1. That the gradual process of which Jerome speaks was coincident with apostolic times, and the change, therefore, had apostolic sanction; 2. That Jerome elsewhere, in a letter to Evagrius, reserves for bishops in ancient times the right of ordination, and so concedes the essential distinction between their office and that of the presbyter; and 3. That, at the close of the latter passage, he seems to allude to some parallel between the threefold order in the Jewish hierarchy and the different offices of the ministry under the new dispensation. Presbyterians have felt no difficulty in obviating the force of all these pleas. The premiss of the first has been peremptorily denied. Jerome could not mean a process transpiring under the eye and authority of the apostles. To prove the original identity of bishops and presbyters, he quotes from three epistles of the New Testament. The fact of such identity must have existed in the age when the apostles wrote them; but the force of his reasoning would have been thoroughly neutralized if the change by which the bishop was advanced above the presbyter took place in the same age, and claimed as high a sanction as the previous condition of parity. One of the epistles cited bears a very late date in the history of Paul. As to the alleged reservation by Jerome of the Episcopal prerogative in respect to ordination, the clause upon which the allegation is founded occurs in his letter to Evagrius, where he argues the duty of the deacon to be subject to the presbyter on the high ground that, by express apostolical arrangement and commission, the presbyter originally had as much power as the bishop. Even as to the existing usage of the church in his own day, he affirms that there is no difference between the offices, except as to the prerogative of ordination. “Quid *facit*, excepta ordinatione, episcopus, quod non faciat presbyter?” To suppose that the affirmation implied in this query relates to the primitive church, and not exclusively to the church of his own day, is inconsistent with the mere grammar of the words, as well as with the basis of his whole argument—the complete identity of the two offices in primitive times. And, lastly, as to the clause in the same letter,—“Seeing we know that the apostolical traditions were taken from the Old Testament: what Aaron and his sons and the Levites were in the temple, that let bishops and presbyters and deacons claim to be in the church,”—it is clear that, since the whole drift of the letter is to prove that bishop and presbyter were the same originally, and that the distinction arose not as an *apostolical tradition*, but from the *custom of the church*,—the two offices of presbyter or bishop, and deacon, as a divine institute, are here represented as corresponding with the offices of the priesthood and the Levites under the old dispensation. In any other sense, the statements of the learned father would embrace an unaccountable contradiction.

The representation of the people in presbytery.

II. If, in the office of presbyter, the Head of the church has made provision for its due government, in the representative element, there is a sure guarantee for its liberty. As the church is not a democratic mob, so it is as remote from being a despotic autocracy. It is the remark of Bunsen, that in all congregational and ecclesiastical constitutions, Christian freedom, within limits conformable to Scripture, constitutes the first requisite for a vital restoration. How far the Presbyterian system embodies the needful securities for freedom as well as order, must be briefly indicated.

1. Presbyterians deny that all church power vests exclusively in the clergy. The clergy exist for the church;

the church does not exist for the clergy: "unto this catholic visible church Christ hath given the ministry." (West. *Conf. of Faith*, xxv. 3.) While they believe that the proper and primary subject of church power is the eldership, and that it comes to them in immediate donation from the Head of the church, still the power is to be exercised for the good of the church; government is a blessing conferred upon it as a whole; and in all that relates to the formation of symbols, liturgical service, the enactment of canons for the ends of order and harmony, and the administration of discipline the people are entitled to a share in the government, real and substantive, although indirect, and under the two formal limitations, that it be in consistency with Scripture, and exercised through regular office-bearers duly qualified and appointed.

2. Such a recognition of the people is sanctioned by the spirit of numerous references to them in Scripture, according to which they, not the clergy, are the church; the Spirit dwells in them, as in the clergy, for light and guidance; "the whole church," as well as the "apostles and elders," is represented as giving certain commissions, and transmitting certain decrees (Acts xv. 22, 23; 2 Cor. viii. 19); they are held responsible for the teaching to which they listen (Gal. i. 8), and for the character of the members admitted to the privileges of the church (1 Cor. v. 4).

3. Provision for the expression of this influence, and the fulfilment of this responsibility, is made,—*first*, in the terms on which the pastoral tie is formed; and, *secondly*, in the existence of a ruling, as distinguished from the teaching eldership. In regard to the former, the degree of popular control over the appointment of ministers varies. In all churches, where the state does not interfere, the privilege of choosing the minister is left with the people. Even when election by suffrage has not been the rule, the intrusion of an unacceptable minister has been condemned, as, for instance, in the Second Book of Discipline, prepared for the Scottish Church in 1581. Such a right in behalf of the people has been argued from the essential genius of presbytery, from the general tenor of Scripture in all the passages which narrate the appointment of ecclesiastical office-bearers (Acts i. 15–26; vi. 1–6; xiv. 23), as well as those in which the nature of the bond between the rulers and the ruled is described; and from the historical fact that, however rapidly corruption spread in the church, the right of the people to an effective share in the appointment of their ministers withstood for ages the swelling tide of clerical encroachment. On this last point the best authorities on ecclesiastical history are quite at one. "Cyprian," Neander tells us, "conceded to the community the right of choosing worthy bishops, or of rejecting unworthy ones. This conceded right of approving or rejecting was not a mere formality." *Secondly*, The existence of the ruling eldership serves also to elicit the mind of the people in the practical administration of ecclesiastical affairs. That a ruling is distinguished from a teaching eldership in Scripture, though the distinction involves nothing more than two functions in the same office, appears from the emphasis with which the duty of the ruler is particularized (Rom. xii. 6–8); from the separate place it holds in the inspired enumeration of gifts and offices in the church (1 Cor. xii. 28); from the express discrimination instituted in 1 Tim. v. 17; and from the plurality of elders admitted to have existed in the primitive churches. Neander states that, as the faculty of teaching and the talent for administration are distinct gifts, "the function of teaching, and that of church-government, were originally distinguished and held separate from each other." It is added, "in the first epistle to Timothy (v. 17), those of the presbyters who, to the talent for government could unite also that of teaching, are accounted worthy of double honour, and the prominence given here to each may be regarded as another proof that the two were not *necessarily* and *always* united." An historical argument for the ruling eldership is also urged from various statements in the fathers. Such a class of functionaries, chosen by the people, and identified with them in all the affairs of common life, are an absolute prevention against the rise of a clerical oligarchy, with supreme and unchecked power over the church.

Provision for the unity of the Church

III. There are certain rights, in the possession of which each congregation must not be disturbed. It has the power of discipline and the right of jurisdiction within itself; so that, in the case of a congregation standing alone, where circumstances do not admit of connection with other congregations in the form of subjection to a common and superior jurisdiction, it has the free use of all its powers for the purposes of edification and extension. When united, too, with other congregations, the authority to which it becomes amenable is not privative in the sense of curtailing its privileges, but cumulative in the way of increasing them. In virtue of the spiritual life animating the members of the church, and just in proportion to the intensity with which it operates, there will be the instinctive desire of association in common bonds and duties. It is believed that the general theory of the church to be gathered from all in Scripture relating to it, leads to the conclusion, that it is not to be a congeries of separate and detached communities, but one body, and that certain general principles are indicated through which the formal exhibition of this unity may be rendered obvious to the world. As the ethics of Scripture supply us only with leading principles for our guidance, and waive minute questions of casuistry; so, in the polity of the church, the arrangements for the manifestation of its external unity are indicated by some fundamental considerations which may require skill and caution in the proper evolution of them; but, in their generality, leave us some measure of freedom in the adjustment of ecclesiastical polity to local wants and temporary exigencies.

Among the arguments adduced in proof of the obligation to promote and secure this outward manifestation of unity, it is common to insist upon *the nature of the church*. It is not merely represented as one,—one in creed and privilege, and hope,—but the oneness attributed to it springs from the workings of the same Spirit into which all its members are baptized. As the vital principle seeks at once embodiment and development in an organism appropriate to its special ends and instincts; so the saints, as the instinctive dictate of their spiritual nature, entwine their affections around each other in a common brotherhood; and the same principle which induces them to coalesce in one locality for public acts of faith, binds them to seek union on the basis of a more extended confederacy. The principle is of importance, as tending both to check the pride of sectarian isolation and to discriminate the true church from the false. Wherever there is an indisposition to acknowledge true membership,—real connection with the body of Christ,—in a character rich in the best fruits of faith, because, in deference to the higher principles of unity, such a Christian repudiates some nominal badge of it, imposed merely by human authority, the first law of Christian order is violated which enjoins us to establish Christian fellowship upon one basis—"the unity of the Spirit in the bonds of peace." In other words, the denial of the reality of Christian character, however clearly attested, beyond our own pale, is schism and something worse. Surely, therefore, some constitutional provision must exist in the church by which an isolation, practically tantamount to so great an error, is avoided, and Christians in other congregations besides our own may be recognized as such. *Secondly*, The *duties enjoined* upon the members of the church imply reciprocal obligations and common action beyond the limits of a single congregation. In witnessing for the truth, in the endeavour to secure a well-qualified ministry, in the jealous vigilance that must be exercised to secure purity of communion, and in the diffusion of the gospel, especially among the heathen, the same law which obliges us, for the sake of combined action, to defer to the judgment of brethren in one congregation, binds us to the same exercise of self-control in regard to all the congregations which may be willing to associate with us. It is impossible to see how some of these ends can be promoted, except by subordination to a common jurisdiction, either permanent and authoritative, or special and by agreement; but to meet an abiding necessity, it holds to reason that the constitution of the church should embody a standing provision. *Thirdly*, All *the views given us of the primitive church* proceed upon the supposition of a unity pervading it, and linking its members, not to one congregation in Jerusalem, but to all congregations on the earth. The apostles exercised a common authority over them all, and so constituted them from the first that they were not separate and independent, but so united as to be capable of being denominated one church. This, in the judgment of Presbyterians, is obvious, from the single fact that, though in Jerusalem, Ephesus, and Corinth, there were several congregations, all believers in these cities are sometimes spoken of as one church (1 Cor. i. 2; xiv. 34). *Fourthly*, The precise form in which this unity was practically realized was *through courts of review* (Acts xv). The main features of the transaction there recorded are,—a reference from a particular church to a council assembled elsewhere, a decree passed as the result of consultation, and the obligation asserted of that decree upon all churches. The inquiry, as indicated by the narrative and the decision, related not to a matter of fact on which information was sought, but to a question of principle on which the council assumed its own authority to pronounce. Nor is the decree to be explained merely as the utterance of inspiration; for on this ground the dispute could have been settled at once by Paul at Antioch. The transaction is best understood as the warrant by which a new privilege was conferred on the church, and a new development of its organic power was sanctioned in accordance with the obvious necessities of its growth,—namely, unity, in the form of several congregations ranged under a common jurisdiction.

History of Presbyterianism.

In the belief of Presbyterians, it was only after the lapse of two centuries that diocesan Episcopacy became the prevailing form of government in the Christian church. The instances of the Presbyterian government in succeeding centuries belong rather to the department of the historical argument in its favour, and involve details, the full review of which is beyond our limits.

Middle ages.

On the authority of Philostorgius, it is alleged that the Gothic churches, till the time of Ulphilas, were under Presbyterian government. The case of Bavaria has sometimes been adduced as a decided instance in which this form of government obtained from the year 540 till the pontificate of Zachary in 740. In his letter, still extant, to Boniface Moyunt, Zachary seems to affirm that, before he had imposed Vivilo upon that province as its bishop, the presbyters in it had not received Episcopal ordination. The expressions of Zachary, however, may be interpreted as signifying little more than that it was uncertain by whom the Bavarian presbyters were ordained. Lechler[1] holds that the Presbyterian system was not borrowed by the Reformers from the Waldenses, inasmuch as no trace of the eldership can be proved to have existed amongst them in ancient times. This position is scarcely tenable; for the essential character of Presbyterianism is not absolutely dependent upon the existence of this class of functionaries, even on the supposition, which has been denied, that, as it exists amongst the Waldenses now, it is an innovation upon their ancient polity; while, on the testimony of their own historians, as well as according to the earliest Romish authorities, Reinerus, Seyssel, Æneas Sylvius, and Bellarmine, it is clear that they distinctly repudiated a hierarchy—any grade of office superior to the presbyter. Seyssel, the first archbishop of Turin, describes their system in a treatise which he published in 1520, after he had visited that part of his diocese, and his testimony clearly excludes all higher authority than the presbyter:—"Those whom they judge to be the best amongst them, they appoint to be their priests (that is, presbyters), to *whom* upon all occasions they have recourse, as to the vicars and successors of the apostles." "They deny," says Æneas Sylvius, "the hierarchy; maintaining that there is no difference among the priests by reason of dignity of office." The letter of Morel, a Waldensian minister, to Œcolampadius, in 1530, mentions a general council of these presbyters, by which the ecclesiastical affairs of the community were regulated.

Germany.

In the various countries to which the influence of the Reformation extended, the constitution of the Protestant churches was modified by the degree of freedom which they enjoyed. In proportion as they were left free from the control of the state in establishing their polity and order, the tendency in the first instance was to the Presbyterian model. The Lutheran churches mostly in the end adopted the consistorial system; the Reformed churches the Presbyterian system; but the statement must be qualified by the admission of some exceptions. At Zurich, the church, though one of the Reformed, was scarcely Presbyterian; while in Saxony the Reformers yielded only to the pressure of circumstances in accepting the consistorial system. There is accordingly a difference between the theoretic views of Luther, and their practical development. Proceeding upon the principle of the universal priesthood of believers, he held that ecclesiastical rights and functions pertained primarily to the church; in the exercise of discipline, he procured the co-operation of lay members as advisers; and in 1523 he counselled the Bohemians to elect their own pastors and bishops. Such, however, was the general ignorance of the times, that his chief object was to institute meanwhile a system for instruction in sound doctrine. He derived greater assistance from the princes and the magistrates in settling and governing the church than from the people, who as yet were scarcely so enlightened as to be entrusted with the responsibilities of government. Nothing can be more emphatic than Luther's condemnation of magistratical interference with spiritual affairs; but the arrangement to which he submitted, as all that was practicable at first, became the rule for the organization of the church. The civil authorities were slow to surrender the control they had thus acquired over it. The consistories, moreover, though originally church-courts for ecclesiastical affairs, gradually lost their strictly ecclesiastical character. At Leipsic, in 1547, it was decreed by an assembly of the estates that the consistories should administer secular as well as spiritual matters. The fundamental idea of the consistorial system is the transference from the Romish bishops to the civil ruler of all ecclesiastical jurisdiction, so far as consistent with liberty of conscience, and with the *jura ordinis* peculiar to the clerical office. On this principle, the members of consistories are appointed by the state. The consistorial system, therefore, has simply these two points of affinity with presbytery; it embodies indirectly a representation of the laity, and it is based upon Luther's rejection of any office superior to the presbyter; for, though to the present day, the Lutheran Church employs the services of superintendents, their office is based on mere expediency, not on the authority of Scripture or the precedents of antiquity; they confer only Presbyterian ordination; they do not necessarily continue in their position for life; and their reports as to the spiritual condition of their districts must be rendered to the consistories, from whom also they receive directions on all affairs of higher moment.

---

[1] *Geschichte der Presbyterial, und Synodal verfassung seit der Reformation*, Leiden, 1854.

The consistorial system was modified according to provincial exigencies, but we need only glance at those cases in which a greater approximation was made to the cardinal principles of Presbytery. Brenz, in 1526, erected in the free imperial city of Halle in Suabia a form of church-government, in which an eldership of pious men was conjoined with the pastorate in the superintendence of the congregations, but the right of appointing them to their office was left with the magistracy, if evangelical, in the German sense of that term,—in other words, if belonging to the Protestant church. At the synod of Homberg, in the same year, Francis Lambert proposed a scheme of provincial synods, consisting of the pastors and a deputy from each congregation. The system was synodal rather than presbyterial in character, and was never established, as Luther, on being consulted respecting it, deemed the people as yet incapable of self-government. In 1539, however, the office of elder was introduced into the Hessian church, but the circumstance did not lead to any representation of the popular mind and will in the higher ecclesiastical courts. After a lengthened struggle with the civil authorities, John à Lasco, in 1544, succeeded in erecting Presbyterian church-government at Embden, and the flourishing Reformed church of East Friesland was the result of his labours. The substance of his system may be gathered from the form of government drawn up for the German congregation in London, with which he was afterwards connected. He recognised only two offices, the eldership and the deacons; but the former comprehended two classes, the teaching and the ruling elders. From a leet nominated by the congregation the consistory elected those whom they regarded as fittest for office. The advance which à Lasco made upon Calvin's system, as established at Geneva three years before the erection of Presbyterian government at Embden, consists in the identification of the clerical office with that of the eldership, in the recognition of the consistory as the organ of the whole congregation, and in the power secured for the people in elections. The same accomplished Pole was afterwards called to Frankfort, and under his influence Presbyterianism gained a footing in that city. In the palatinate the accession of the elector Frederick III. to the Reformed confession, led to the introduction of a new ecclesiastical polity about the close of the sixteenth century. It was a combination of the consistorial and Presbyterian systems; each congregation had over it a presbytery, consisting of the pastor, and under his presidency, of censors, elected by the ecclesiastical authorities for the maintenance of order and discipline; over the whole national church a council, appointed by the elector, presided, composed of three divines and three civil councillors, and holding its meetings at Heidelberg; subordinate to this council were superintendents in each of the dioceses, and the clergy, along with the superintendents, met in conventions. The persecution of Alva drove from the Netherlands several refugees, who carried with them into the regions of the Lower Rhine their attachment to Presbyterianism. In 1566 a conference held at Wesel issued in the affirmation of the divine right of the eldership —a principle which was more formally enunciated anew by a great synod at Embden in 1571. Arrangements were also made for quarterly meetings of the presbytery, provincial synods annually, and general synods biennially. The system thus established continues in a great measure to the present day. To some extent Presbyterianism was introduced into Westphalia in 1588; and ten years earlier, the province of Nassau enjoyed the full benefit of Presbyterian government and discipline. The subsequent history of Presbyterianism in the German churches is too complicated and various to admit of concise explanation and detail. It is marked by the growing predominance of the consistorial element rather than by any changes in its territorial influence, and the system thus developed has proportionally less claim to be noticed in any historical review of genuine Presbytery. Although in 1835 Presbytery was restored to the churches in Westphalia and the Rhenish provinces, the consistory was engrafted upon the ancient constitution. As monarchy consolidated and extended its influence in Prussia, supreme power became more and more vested in the crown, while pure ecclesiastical authority sank into abeyance. To the extent in which it loses its authority, a church ceases to be representative in government, and by consequence ceases to be Presbyterian. From time to time voices have been raised in vigorous advocacy of the rights and claims of Presbyterianism; and amongst these defenders of the system Lechler specifies Spener, Schleiermacher, and Neander. Excluded from all share in the government of the church, the laity manifest indifference to its external interests. Any desire for the revival of the Presbyterian elements in its constitution has been ascribed more to political motives than to the conviction which chiefly enlisted the early Reformers in its favour,—namely, that when it was properly wrought, no system so effectually secured the church against the admission of the irreligious and unworthy into her communion.

Eastern Europe. Traces of Presbyterianism are to be found in the history of the churches which arose in consequence of the Reformation beyond Germany. The Slavic race indicated generally a preference for the doctrine and government of the Reformed rather than of the Lutheran Church. The first Polish evangelical synod met at Pinkzow in October 1550. According to the annotations of Comenius on the Book of Order, adopted by the Bohemian brethren in 1616, presbyter is a word applied by the apostles "not only to pastors, but to their assistants in watching the flock, who do not labour in word and doctrine;" while the Book of Order itself affirms that, according to the apostles, "presbyter and bishop are one and the same thing." On the same model the Moravian churches were constituted, with a slight admixture of Episcopacy, to the extent of preferring ordination by bishops, though ordination in the Reformed Church was deemed equally valid; and the bishops, far from enjoying the supreme direction of ecclesiastical affairs, were subordinate to a court of elders. In Hungary every congregation originally had a pastor and lay inspector, chosen by the suffrages of the members. There was a gradation of courts, senorial meetings, provincial conventions, and a general assembly. Synodal action of this kind has been in operation since 1564. But recently, since the abortive effort at emancipation from Austrian despotism, the liberties of the Hungarian Church have been suppressed. Its affairs are administered consistorially; in other words, by men whom the government nominates to the office.

Switzerland. In Switzerland the system of government, devised by Zwingle for Zurich, according to which ecclesiastical affairs were entrusted to the care of the magistrate, provided he was a Christian, so that practically the Council of Two Hundred, in the name of the church, administered its affairs, was extended to Berne, St Gall, and Schaffhausen. Œcolampadius proposed a scheme for Basle, in which elders, some of whom were elected by the people, were conjoined with the ministers for the purposes of discipline. After certain essential modifications by the state, so as to restrict still further the independent action of the church, it passed into a law. But in connection with Switzerland, it is of chief importance that we attend to the Presbyterian model as instituted by Calvin at Geneva. And here, too, as in the case of Luther, the difference must be noted between his theory of church-government as he expounded it theoretically, and as it was actually carried into effect or developed in practice. Two leading principles gave shape to the system of polity instituted by this great Reformer. He founded it upon a scriptural basis; and he saw clearly how indispensable a sound species of government was to the maintenance of order and purity in the church. Presbytery commended itself to him as the best form of rule for the preservation of discipline. His system is sketched in two paragraphs of his Institutes. Nothing can be more lucid and concise than his statement (*Institut.*, lib. iv., cap. xi., sect. 11), in which he unfolds the *primary object* of ecclesiastical rule, "ut scandalis obviam eatur,"—in other words, the purity of the church; the *precise character* of it as wholly spiritual, "ut a jure gladii prorsus separetur hæc spiritualis potestas;" and the *scriptural mode* of it by Presbytery, "ne unius arbitrio sed per legitimum consessum administretur." In reference to the second principle, he states expressly, "severissima ecclesiæ vindicta et quasi ultimum fulmen est excommunicatio,"—weighty and pregnant words indeed, as not only claiming independence for the church, but establishing on a solid ground all that is precious in religious liberty! All he asks is the right which must be conceded to every association established for a religious or benevolent purpose, that it should be left free to prescribe its terms of admission, and to enforce compliance with them in the case of flagrant and persistent contumacy by expulsion. He prohibits the church from resort to "mulctis, vel carceribus, vel aliis civilibus poenis." Still further, to guard religious liberty, he vests the jurisdiction of the church not in the clergy alone, but in a presbytery ("senatus presbyterorum") composed of two classes, the teaching and the ruling elders: "Alii ad docendum erant ordinati, alii morum censores duntaxat erant." These quotations are enough to fix beyond question what Calvin's theory of church-government really was, while they show the spirit in which he viewed the whole subject,—as involving the only system on which the seal of divine authority is impressed for preserving, in consistency with freedom and the rights of conscience, the interests of true religion and pure morality.

It is of no consequence to affirm that Calvin made no provision for synodal action. He states the essence of his theory, which by no means excludes a grade of ecclesiastical courts superior to the presbyteries or sessions; and he admits that much in the development of his theory must be left to circumstances. The scheme which he drew up for the French Church includes courts of review. Geneva was too small to require more than a presbytery. Nor is there the least ground for the allegation, that because he used the language of friendly compliment to the church of England, he ever departed from his own principles as early recorded in the Institutes. In his commentary upon Acts xx., one of his latest works, written not long before his death, he states that, "according to Scripture, presbyters differed in no respect from bishops, but that it arose from corruption and a departure from primitive purity, that those who held the first seats in particular cities began to be called bishops."

Calvin was sorely thwarted and trammelled in the endeavour to establish his system in Geneva. The civil authorities were jealous of any rival sway, however carefully discriminated from their own; while the spawn of error and corruption, which the disorders of preceding times had produced, had given rise to the party of the Libertines, who were determined to oppose any system which had for its main object the establishment of better morals. It is difficult to say what might have been the result had Calvin's theory been fully carried out, and had his great principle—the spiritual nature of church power—enjoyed full honour and free scope. The community, under the influence of this truth, would have been trained to feel that civil penalties are not the weapons by which error is to be met; and Servetus, in spite of Calvin, if we assume his direct complicity in the sad transaction, might have been saved from the flames. As a condition of his return to Geneva, Calvin stipulated for the institution of the eldership. The "ecclesiastical ordinances" which ultimately, in 1541, received the sanction of the council, recognised the office of the elders, the nomination of whom lay with the little council and the pastors, while their appointment to the actual exercise of the office, if the persons nominated were found worthy, was vested in the Council of Two Hundred. In two respects the arrangement deviated from the theoretical convictions of Calvin. There was a confusion of the civil with spiritual power in the control which the council thus retained over the election of the presbyters; and another restriction, according to which the members of the council only were eligible to the sacred office, still further violated the autonomy with which Scripture has invested the church. No claim can be urged for Calvin as first broaching the theory of Presbyterian rule; but the twofold merit which Lechler ascribes to him cannot well be denied. He first unfolded the idea of it as a lucid theory, or rather a practical system; and secondly, at the cost of a severe struggle, established it in actual operation in Geneva. The sphere of its influence in that small community might not be great; but the reformation of manners, which, by the verdict of all candid history, it wrought, is the best tribute to its praise; while, as the model upon which the Reformed Church in France and other countries was formed, its nature should be clearly understood.

France. The Reformed Church spread rapidly in France, and from the first it was Presbyterian. So early as 1561 no fewer than 2150 congregations belonged to it; and according to L'Hopital, one-fourth of the nation had seceded from the communion of the Church of Rome. In the year 1555 a meeting of the Protestants in Paris took place; they agreed to elect a minister, elders, and deacons. The example was followed in other towns of importance. In spite of extreme danger, under the very shadow of the gibbets reared for their destruction, deputies belonging to eleven churches of the Reformed faith met in a general synod at Paris. They agreed on a Confession of Faith, and a form of government: the authorship of the latter is ascribed to Calvin. According to this constitution, each congregation had its consistory of elders, the members of which were in the first instance elected by the congregation. Vacancies, however, were filled up by the consistory itself, though the approval of the congregation was essential in every appointment. The election of the pastors was entrusted to the colloquy or provincial synod, subject to a similar check on the part of the people. "If any objection is made," says De Felice, "it must be laid before the bodies who are charged with the choice of the pastors. In no case can an appointment be made in opposition to the vote of the majority." Colloquies met twice a year, embracing one pastor and one elder from each church represented. Provincial synods, comprehending the churches of a wider district, but similarly constituted, assembled once a year. The national synod was composed of two pastors and two elders from each of the inferior synods. The first national synod was held at Paris in 1559; the twenty-ninth, or last, at Loudun in 1669. Permission to assemble has never been granted since. By the law of the 18th Germinal, 1802, five or six churches were placed in subordination to a consistory, nominated in the first instance by the five-and-twenty Protestants of the district who contributed most to the public taxes. No right of election or of veto was reserved for the people. Instead of provincial synods, synods "d'arrondissement" were established, consisting of deputies from five of these consistories. One only—at La Drome, in 1850

—has ever met. Considerable changes were made by the decree of March 10, 1852. Instead of the consistory presiding over five or six churches, there is appointed by the decree a *presbyteral council* for each parish, consisting of a pastor as president, and not less than four or more than seven elders, elected by the people. In the principal towns of a district, general consistories are held, composed of all the pastors and a certain number of delegates chosen by the parishes. Both in regard to the presbyteral councils and the general consistories, half the members comprising them are subject to re-election every three years. There is above all these courts a central Protestant council, composed of the two senior pastors in Paris, and fifteen members nominated by the state in the first instance. The property qualification previously required is abolished. In the year 1858 there were 617 pastors of the Reformed Church in France; the number adhering to the Confession of Augsburg was 273. The funds assigned for the support of the Protestant churches by government amounted to 1,375,936 francs. Besides the churches supported by the state, there are about 120 pastors of other congregations, 27 of whom are connected with "the Union of Evangelical Churches," which are Presbyterian in their forms of government and discipline.

Holland.

The first Dutch provincial synod was held in 1574 at Dort. It adopted the Embden Articles, which conjoined elders with pastors in the government of the church. The state, however, withheld its sanction, and for a long period there was a struggle between the two; the state seeking Erastian control, the church intent on acquiring freedom of action for spiritual ends. The result was, that in despair of establishing a comprehensive national system, each province erected an ecclesiastical constitution for itself, according to the influences that chiefly preponderated in it. Presbyterianism universally prevailed, but it was Presbyterianism in express subjection to civil magistracy. The co-ordinate jurisdiction of the Calvinistic theory was never realized. The synod of Dort in 1618, among the other questions which it had been convened to discuss and settle, took up the point of church government, and emitted a strong declaration in favour of Presbytery. Down to 1795 there were seven distinct ecclesiastical republics more or less under the power of the state, with no organic bond of connection but correspondence by deputations in the provincial synods. In 1816, under royal sanction, a constitution for the whole church was established, embracing provision for a national synod. Some changes ensued in 1852; but the general result has been, that the national church is now divided into forty-three *classes*, under ten provincial circuits, comprehending in all, according to the census of 1850, 1273 churches, 1508 ministers, and 1,661,661 souls.

England.

Presbyterian writers mention a considerable variety of facts in evidence that their ecclesiastical polity is coeval with the primitive Christianity of Britain, and they exhibit a succession of testimonies in its favour, among others that of Wickliffe, down to the times of the Reformation. No doubt can be entertained that many of the founders of the Anglican Church had leanings to it. Cranmer held the identity of bishop and presbyter, and proposed at one time the erection of courts corresponding to the kirk-sessions and provincial synods afterwards established in Scotland. The martyr Lambert, in 1538, testified for ministerial parity. *The Institution of a Christian Man*, a book published in 1536, and not only recommended but subscribed by two archbishops and nineteen bishops, declares that there are "but two orders of clergy, and no one bishop has authority over another, according to the Word of God." The testimony of à Lasco is occasionally cited, in which he affirms that it was the intention of Edward VI. to alter and remodel the English Church according to apostolical purity; while the context clearly shows that, in the judgment of à Lasco, apostolical purity was substantially Presbyterianism. Presbyterian ordination was freely acknowledged by the English divines of the period. Archbishop Grindal, in 1582, appointed Morison, ordained by the Church of Scotland, to pastoral duties within the diocese of Canterbury. When Bancroft, in 1588, first urged the plea of divine right for the superiority of bishops to presbyters, the learned Rainolds, in a letter to Sir F. Knolleys, declared that the contrary doctrine of their equality was "the common judgment of the Reformed churches," and after naming them, he adds, "and our own." The early Puritans of England for the most part held Presbyterian views, though their dispute with the Established Church turned more upon certain rites and ceremonies in its worship. On the accession of Elizabeth, so early as 1566, several excellent divines, disappointed in their hope of a more thorough reformation, agreed "to break off from the public churches, and to assemble as they had opportunity in private houses and elsewhere, to worship God in a manner that might not offend against the light of their consciences." In the preamble to this conclusion, they allude, in evident concurrence with its principles, to "the book and order of preaching, administration of the sacrament, and *discipline*, that the great Mr Calvin had approved of." At length, in 1572, resolved on a more complete organization of their party, fifteen divines, with several influential laymen, met at Wandsworth, a village on the Thames, about four miles from London. Eleven elders were chosen, and their offices described in a register which is commonly known as "the orders of Wandsworth." In spite of the secresy observed, the meeting of this presbytery came to be known. The members of it, however, could not be discovered. Associations on the same model were formed elsewhere. The clergy also, who were inclined to Presbyterian sentiments within the church, held voluntary meetings for mutual advice in associations perfectly akin to presbyteries and synods. The number pursuing this course amounted in 1586 to 500. There is less difficulty in determining the form of Presbyterian sentiment which at this time prevailed than its relative strength in the British community. A book, high in esteem among the Puritans, drawn up by Travers, printed at Geneva in 1574, and entitled *Disciplina Ecclesiæ sacra ex Dei verbo descripta*, affords a clear and full exposition of their views. It suggests the erection of sessions composed of ministers and elders chosen by the people, and upon this inferior court is based a provision for provincial and national synods. By a singular feature in such documents, it proposes an ecumenical council comprehending representatives from every national synod. In proof of the extent to which an inclination for the Presbyterian polity prevailed, appeal has been made to a dialogue published in the reign of Elizabeth, according to which 100,000 are said to have been favourable to it. Of the three parties, Roman Catholic, Church of England, and Puritan, Hallam reckons that the Church of England was "the least numerous of the three." On the other hand, Fuller, in his graphic description of the state of parties, would lead us to a conclusion in favour of the Church of England as stronger than the Puritans. "Now, if Rebecca found herself strangely affected when twins struggled in her womb, the condition of the English Church must be conceived sad which at the same time had two disciplines, both of them pleading Scripture and primitive practice, each striving to support itself and to suppress its rival,—the *hierarchy* commanded by authority, established by law, confirmed by general practice, and continued so long by custom in this land, that had one at this time lived to the age of Methuselah, he could not remember the beginning thereof in Britain; the *presbytery*, though wanting the stamp of authority, claiming to be the purer metal, founded by some clergymen, favoured by many of the gentry, and followed by more of the common sort, who, being prompted with that natural principle that the weakest side must be most watchful, what they wanted in strength they supplied in activity. But what won them most repute was their ministers' painful preaching in populous places; it being observed in England that those who hold the helm of the pulpit always steer people's hearts as they please."[1] It is admitted that the strength of the Presbyterian interest was greatly increased through the reaction excited by the policy of Laud. Arminianism, distasteful to the mass of the clergy, obtained favour under his administration. The Calvinistic clergy, feeling that they could put no reliance on the bishops or the state, in order to check its spread, were the more eager to secure the erection of a Presbyterian polity, according to which the general mind of the church might obtain free expression and due influence. At length Presbyterianism was in the ascendant. In 1642 Episcopacy was abolished. The Westminster Assembly, convened by the Parliament in 1643, declared in favour of Presbytery after long and patient discussions. A struggle was made to procure from Parliament the recognition of it as of divine origin and authority; the Parliament contented itself with the acknowledgment of it as "lawful and agreeable to the Word of God." By a parliamentary order of March 1646, ruling elders were to be chosen in all the English congregations, while ecclesiastical judicatories were also to be created. The system was next year carried into effect in London and Lancashire. In 1648, with the exception of chapels for the king and peers, "all parishes and places whatsoever" were declared to be under Presbyterian government. On the accession of Cromwell to supreme power, the strength of Presbyterianism declined. It had a brief revival in 1660, when it was established anew by Parliament. On the Restoration, it gave place to Episcopacy, and more than 2000 ministers, nearly all Presbyterians, refusing to comply with the Act of Uniformity, were in 1662 expelled from the Established Church. Ever since this date Presbyterianism has been a distinct communion in England.

In common with other Dissenters, Presbyterians sustained no small persecution till the Revolution, when the Toleration Act in 1689 secured them considerable freedom. Their cause sprang elastic from the previous depression, and in less than thirty years they had more than 800 congregations in England, Yorkshire alone containing no fewer than 59. They represented fully two-thirds of the Dissenting interest. Various causes have been assigned for the rapid declension which, in the course of the next century, took place in their numerical strength. Arianism, ripening fast into Socinianism, spread amongst them, partly because subscription to the standards of the church was not enforced, and partly because Presbyterian government was not brought into complete and efficient operation. Such are the reasons at least commonly assigned for this lapse into heterodox tenets, but it must have had connection with some wider causes then at work by which all evangelical churches in Europe were similarly and at the same time affected. In London, at a meeting in Salters Hall, out of 110 present, 53 only voted in favour of requiring from ministers subscription to the doctrine of the Trinity. A division ensued,—one party exacting adherence by subscription to the first article of the Church of England, together with the fifth and sixth questions in the Shorter Catechism; the other resisting the imposition of any such term of communion, although they would commit themselves to no denial of the divinity of Christ and the doctrine of the Trinity. In Northumberland alone, where Presbytery continued to be most efficiently wrought, Socinianism was completely excluded from its congregations. The influence of such men as Lardner and Priestley naturally led their brethren in the ministry to make an avowal of Arian or Socinian views with the same boldness which marked the opposition of these distinguished men to orthodox doctrine. In proportion as Socinianism came to be freely published and declared from the pulpit, and the forms of Presbytery sunk into desuetude, multitudes in the Presbyterian congregations found, in the evangelical preaching to which they listened elsewhere, an attraction before which any regard for another polity was felt to be of subordinate importance. The spiritual activity of other churches, Methodists and Independents, absorbing into its own channel the life and zeal which found no scope elsewhere, contributed still further to reduce the strength of the Presbyterians. The number of their congregations, both orthodox and Unitarian, was estimated in 1812 as amounting to 270. In 1850 there were 217 Unitarian congregations; but as they have neither sessions over particular congregations, nor courts uniting them under a common jurisdiction, they cannot properly be designated Presbyterian. In the national census, they rank under the title "Unitarians." Still there are many congregations, especially in Northumberland, who trace their origin up to 1662, when they were formed under the labours of ministers ejected by the Act of Uniformity. But the chief form under which Presbyterianism now appears in England is in connection with Scotch churches of the same doctrine and polity. About 15 are in connection with the Established Church of Scotland, and 60 with the United Presbyterian Church, to the extent of being represented in its annual synod. A still larger body, numbering about 90 congregations, though it maintains friendly relations with the Free Church, made a declaration in 1844 claiming to be a separate and independent church, with its own theological seminary and supreme court. Never ecclesiastically incorporated with any other church, and abiding by the Westminster Standards, it represents the old Presbyterianism of England, however much its membership may be sustained by immigration from the north. Proposals have been sometimes made for a union between the two last-mentioned bodies, but hitherto without success. In Wales, the large body of the Welsh Calvinistic Methodists, with upwards of 800 chapels and nearly 60,000 communicants, are substantially Presbyterian.

Scotland. The first General Assembly of the Church of Scotland was held in 1560. Of the 40 members, 6 only were ministers. The same ministers who drew up the Confession of Faith, which the Parliament had already ratified, were appointed to prepare a scheme of government and discipline for the church. It was presented to the Assembly, which met early in 1561, and cordially adopted; but on being submitted to the Privy Council, though several nobles and burgesses in Parliament subscribed it, it was never ratified by the authority of the state. The church, however, continued to be guided by it, and a simple review of its provisions will show that the subsequent Presbyterianism of Scotland has always in substance embodied the leading elements of the system described in it. The ordinary offices established by it are four in number,—pastor, doctor, elder, and deacon. The duties of the pastor only differed from those of the doctor in the difference of the sphere in which they were exercised; the former relating chiefly to the interests of a particular congregation, while the latter office was rather exercised in schools and universities. The elder was the assistant of the pastor in government and discipline. Upon the deacon devolved the care of the poor and of the revenues of the church. Two extraordinary offices were also appointed:

---

[1] Fuller's *Church History*, xvi., cent. A.D. 1588.

readers, who, on the strength of a common education, could read the Scriptures to their ignorant neighbours, and who received the higher appellation of exhorters, if they were found qualified to follow up the reading of Scriptures with a plain and pious address. The other office was that of the superintendent, whose duty was to itinerate over a province, preaching the gospel, planting churches, and watching over the conduct of the pastors and readers. The election of the minister is distinctly entrusted to the people. Provision is made for the erection of four ecclesiastical courts: the kirk-session, consisting of pastor, elder, and deacon; a meeting called a prophesying, which afterwards merged into a presbytery, and which took under its charge several congregations of a district; provincial synods; and the General Assembly, in which ministers and elders, representing all the presbyteries throughout the kingdom, met for the administration of ecclesiastical affairs. It will be observed that, though so far as it was Presbyterian, there could be no essential difference in this system from what had been instituted twenty years before in Geneva, there is really ground for the assertion of Row, that the Scotch Reformers "took not their example from any kirk in the world,—no, not from Geneva!" It was national rather than municipal in its scope and design. The device of superintendents, too, as "expedient for the time," to use the words of the Book of Discipline, indicated that the founders of this polity were not so trammelled by implicit deference to Genevan arrangements as to overlook the necessity of special adaptation to the wants and circumstances of their own country. Nor is there any ground for regarding these superintendents as in any sense bishops. Elected by the people, ordained by presbyters, acting only in concert with provincial synods, responsible for all their proceedings to the General Assembly, and ceasing when presbyterial organization throughout the land was sufficiently complete to supersede the necessity for such temporary office-bearers, they really bore no character and exercised no functions analogous to Episcopal authority. It is only due to the sagacity of the early founders of the Scottish Church to mention another distinctive feature of their system. They saw that the people might be the worst enemies to their own privileges if they were not trained to the proper use of them; and hence, besides a scheme for the administration of the church, it embraced, as essential to its proper working, an elaborate plan of national education. With the exception of the superintendents and the readers, the Presbyterian churches of Scotland to the present day exhibit substantial conformity to the scheme of Knox, so far as relates to the different offices and to the courts of review. The single question, however, raised by the appointment of ministers has given rise, with but one exception, to all the Presbyterian churches existing in a state of separation from the Establishment. In the latter the people have only the right of stating objections to a presentee, whereas in the former the full liberty of election is conceded to them.

This accordance of Scottish Presbytery with the original scheme devised by Knox and his associates renders it necessary only to mention the steps by which its establishment was secured. The various branches into which it came to be subdivided belong to another department of this article. Meanwhile, attention is called to the history of the system, rather than of the churches adopting it. The First Book of Discipline did not receive formal ratification from the state. The true motive on account of which this was refused transpired in the endeavour on the part of the nobles to secure the property of the church. The courts of presbytery proved so strong an exposition of public feeling as to hold in check aristocratic rapacity. A natural leaning to Episcopacy was thus produced in the higher circles of society, under an impression that bishops, owing their titular dignity to civil patronage, would evince readier subserviency to the designs of the court. A convention of superintendents and ministers, under the influence of Regent Morton, met at Leith in 1572, and passed a decision by which Episcopal titles were retained in the church. So soon as this point was gained, the titles were bestowed on such as consented to receive benefices on the condition of restoring to the patron the best portion of their annual revenues. This simoniacal arrangement was stigmatized in popular wit as *tulchan* Episcopacy, from the practice in the country of placing before a cow, that it might yield its milk freely, an image with the skin and in the shape of a calf. Even according to the scheme sanctioned at Leith, these nominal dignitaries were declared to be subordinate to the Assembly, a feature of vital difference from common Episcopacy. In 1580 the Assembly declared the office of bishop to be without scriptural authority, and charged such persons as held it to demit it immediately. In the light of these facts, the Second Book of Discipline will be properly understood; which, adopted by the Assembly in 1581, and, partially at least, recognised by the state in 1592, best illustrates the type of Scottish Presbyterianism in this age. Ecclesiastical jurisdiction is formally based on dogmatic grounds, the headship of Christ; so that, blending with the highest articles of the Christian faith, it could not cease to be an obligation on the conscience so long as Christianity itself was embraced. In proportion to the weight and sacredness of such a claim, it needed the more careful discrimination from civil authority at once to prevent abuse and to appease the jealousies of the state; and hence the Second Book of Discipline insists upon the distinction between civil and ecclesiastical power. Warned by the recent struggle of the church against a pseudo-Episcopacy, the framers of this book omitted all reference to the extraordinary offices, the superintendents and exhorters, mentioned in the system of discipline adopted in 1560. Not content with this, they inserted a special protest against the notion of any superiority on the part of a bishop as above the presbyter. They desire the abolition of patronage, as it "cannot stand with the order which God's word craves." The spirit of the whole book may be described as evincing the utmost anxiety to establish, in the first place, an efficient discipline in each congregation for the purity of the church; secondly, a firm bond of unity in courts rising in succession to one that sustained a relation to the whole church, and of last resort in all cases of discipline and points of controversy; and lastly, harmonious co-operation with the civil authorities, under no compromise of the rights or interference with the functions respectively belonging to church and state. Hence, in the language of the German historian Lechler, the Church of Scotland, "by its earnest and persevering struggle for the complete independence of the church in contradistinction to the state, and by the prominence assigned to the most important and practical truth, that Christ is the only Head of the church, shows itself beyond question in advance of all the Reformed national churches."

Although the Second Book of Discipline was not formally and in express terms ratified by the act of Parliament in 1592, there can be no doubt that it was the system of government observed at the time by the Scottish Church; and the act incidentally recognises, and so far by recognition sanctions, "the jurisdiction and discipline of the church as the same is used and exercised within this realm." The state, however, speedily resolved upon another policy than that to which it seemed committed by the provisions of this enactment. It strove to re-establish Prelacy; and the plan taken to accomplish this object was the control, with a view to the ultimate suppression, of the church's prerogative of meeting in free assemblies. Gradually the power of the crown made way in spite of the heroic resistance of the clergy, and the moment seemed close at hand when, by a single stroke, the state might venture to consummate a long course of policy, and abolish the last vestige of Presbyterianism. It is only the more educated class that can be expected to appreciate the value of a sound theory of government in a church. Worship appeals directly to the individual conscience. The zeal of Laud, more impetuous than discreet, insisted on the introduction of the Liturgy. It was the spark on the dry grass of the prairie. The nation was at once inflamed with indignation. The issue of the various struggles and conflicts which ensued was Presbyterianism—not merely restored to Scotland, but established in England; not by an act of Parliament only, but by the oath of the three kingdoms,—the Solemn League and Covenant.

From 1638 to 1649 the Church of Scotland enjoyed perfect exemption from the control of the state. Not only so, but the Scottish Parliament ratified willingly all the Westminster standards of faith, the Confession, and the form of church government,—in this respect outstripping the English Parliament, which, while it ratified and approved of the doctrinal part of the Confession of Faith, "recommitted" the chapters described as "the particulars in discipline." In 1653 the Assembly was interrupted and dissolved at the instance of Cromwell; nor had it ever liberty to meet again during his life. The type of Presbyterianism which the Scottish Church thus received from the English divines contained no point of essential difference from that exhibited in the Second Book of Discipline. There are the same three essential offices—minister, elder, and deacon; for though, as in the Scottish scheme, we read of pastors and doctors, the account given of them indicates a division of labour, and not a distinction of office. There is the same gradation of courts. The only point of difference is the apparently lower degree of privilege conceded to the people in the settlement of ministers. The presbytery is to proceed to ordain, if there be no just exceptions against the presentee. Still there is no absolute denial to the people of the right of election; for, at the outset of the regulations on this head, it is supposed that he may be "nominated by the people." In Scotland, by the act of 1649, he was to be nominated by the session. At the Restoration the system of government thus established was overthrown, and Episcopacy for twenty-eight years again enjoyed the favour and support of the state. Finally, when the Revolution occurred, all legislation in favour of Presbyterianism was found to be buried under rescissory acts. The government of William did not cancel the acts rescissory, but simply, in the Act of Settlement, made a statutory recognition of the Confession of Faith, "voted and approven by them as the public and avowed confession of this church;" they further revived and confirmed the act of 1592, and having reserved the question of the appointment of ministers for further consideration, they gave the privilege to the heritors, but latterly, in 1711, it was given to the ancient patrons. It is this question which has since produced the greatest changes in the external aspect and position of Scottish Presbytery. No essential divergence in respect either of doctrine, government, worship, or discipline, has taken place from the Westminster deeds to the extent of a formal and avowed renunciation of them, except that in one denomination adherence to the articles on the power of the civil magistrate has been somewhat qualified. For three hundred years the avowed faith of the Scottish people, both in regard to the doctrine and the polity of the church, has been, amid all the countless vicissitudes of speculation, unchanged. The key-note struck by Knox has never ceased to find an echo in the ear and heart of his nation.

reland.

Escaping from Scotland and England, many Presbyterians sought in Ireland some relief from the persecution which they experienced in the former countries. The ministers amongst them were permitted to exercise their office and share emolument in the Established Church, till they were ejected and silenced in 1634, when Laud insisted on the Book of Canons, and substituted for the Irish articles of 1615 the Thirty-Nine Articles of the Church of England. Direct persecution was put in force against them; but the freedom they enjoyed after the rebellion enabled them to establish the Presbyterian system, not in Ulster only, but in other parts of Ireland. In 1642 the first regular meeting of presbytery was constituted at Carrickfergus. At the Restoration, 61 ministers were not only expelled from their benefices, but deposed from the ministry. Heavy penalties were threatened if they dared to preach or baptize; harsh and angry proceedings, in which Jeremy Taylor tarnished the lustre of a brilliant name, and all the more ungenerous that the Presbyterians of Ulster had stood so fast by the royal cause at the lowest ebb of its fortunes, that afterwards, in 1672, the crown, in recognition of their services against Cromwell, was constrained to honour them with an annual grant of money. However discountenanced, Presbyterianism held its own in Ulster. The Revolution found it with nearly a hundred congregations, under the care of five presbyteries and a general synod. It partook in Ireland of the same changes which mark its history in England. A large proportion of its ministers became imbued with Arian and Socinian views. In 1727 the presbytery of Antrim seceded on this ground from the general body; and more recently, in 1829, a similar rupture took place, in consequence of which the Remonstrant Presbytery was formed. Together with the presbytery of Munster, which dates from 1660, these two bodies form "the General Nonsubscribing Presbyterian Association of Ireland." From the times of the persecution some Presbyterians had protested against the acceptance of any indulgence. Their principles were transmitted from generation to generation, till they appear embodied in "the Reformed Presbyterian Church of Ireland." The Secession in Scotland had also its representatives in Ulster, who latterly, in 1840, effected a junction with the synod of Ulster, and both parties became merged under the common name of "the Presbyterian Church of Ireland." The present condition of the Presbyterian interest may be gathered from the statistics of the various bodies composing it. The Presbyterian Church of Ireland has 559 ministers and 514 congregations. In connection with the Reformed Presbyterian Synods there are about 30 ministers and 40 congregations. The Secession is represented by 15 ministers, and as many congregations.

America.

American Presbyterianism has a manifold but honourable origin. The main stream of immigration by which it has been fed from the beginning of last century has been from Ireland and Scotland. Before the close of the seventeenth century the greater number was from the latter country. The Presbyterians of Ireland, however, long after the Revolution, continued to labour under disabilities, from the operation of the Sacramental Test Act, and from the peculiar tenure of land, which induced emigration to a greater extent from Ireland than from Scotland. Before the middle of last century 12,000 annually left Ireland for the New World. New Jersey, Pennsylvania, Virginia, North and South Carolina, were the parts of America to which Presbyterian emigrants directed their course. Four other sources may be specified whence important accessions have been derived to the general body of American Presbyterianism,—The Puritans of England, the Reformed Church of Holland, the Protestants of Germany, and the Huguenots of France. Philadelphia was the seat of the first presbytery, which was organized in 1705, and consisted of seven ministers. In 1716 a synod was formed; and at length, as the church increased, the body was divided in 1787 into four synods, under a general assembly. In 1729, by a formal act, the Confession of Faith and Catechisms of the Westminster Assembly were adopted. For more than a hundred years the harmony of the church was not disturbed by any controversy on the subject of doctrine. Three causes have been assigned for the disruption of 1838, through which it divided into Old School and New School Presbyterians,—*first*, an admixture of Congregationalists from the New England States, who naturally leant to their old ecclesiastical usages; *secondly*, the spread of erroneous sentiments on such points as original sin, election, and efficacious grace, or at least attempts to obviate the objections to them philosophically on principles that seemed to concede the doctrines themselves; and *lastly*, a preference by some for voluntary societies, rather than ecclesiastical action, as the proper method for the advancement of religious objects. The Old School were attached to the previous views and system of the church on all these points. The New School has experienced since 1857 a similar division,—the southern portion espousing a position of entire neutrality on the question of slavery, and practically abetting it; while the northern congregations are disposed to countenance an opposite line of policy. According to an official statement in 1858, at the end of May the Old School had 33 synods, 159 presbyteries, 2468 ministers, 3357 churches, and 259,335 communicants; while its contributions of various kinds for the year had amounted to 2,632,717 dols. The New School, on the other hand, has 26 synods, 120 presbyteries, 1613 ministers, 1686 churches, 143,410 communicants; its contributions for religious purposes last year amounted to 273,952 dols. The body seceding from the New School in 1857 have taken the name of "The United Synod of the Presbyterian Church," and numbers 113 ministers. There is also a Free Presbyterian Church, which refuses communion with slaveholders, and has 43 ministers.

There are other bodies which from the first have held a separate standing in America. The *Dutch Reformed*, almost from the middle of the seventeenth century, had a footing in the States. They were under the government, however, of the classis of Amsterdam till 1772, when they obtained regular and independent organization under five classes, subordinate to a general synod. In doctrine this church is purely Calvinistic. It has about 330 ministers.

The *German Reformed*, moreover, has enjoyed an independent constitution since 1792, and has 350 ministers.

Since 1752 the *Reformed Presbyterians* had assumed organization as a distinct body in the States; but their first presbytery was constituted in 1774. In 1833 they divided upon the question of their relations to the civil government of the United States,—one party holding that, in consequence of the constitution supporting slavery and not recognising Christianity, it could not receive their conscientious support; the other contending that it was not formally opposed, but rather favourable on the whole to true religion, and that slavery was an unconstitutional abuse, which they did not despair of seeing rectified. There are now synods belonging respectively to each of these parties,—the former, styling itself the Synod of the Reformed Presbyterian Church, has 53 ministers; the latter, called the General Synod of the Reformed Presbyterian Church, has the same number.

About the year 1754 the *Associate Synod* of North America had its commencement, representing the Secession Churches of Scotland; and on a junction between some of its members and some members of the Reformed Presbyterian Synod, the Associate Reformed Church was in 1782 originated—the attempt to unite two churches having issued in the formation of three. In the course of 1858, however, the Associate Synod and the Associate Reformed effected a union, under the designation of *The United Presbyterian Church*, which is distinguished from the main body of American Presbyterians by three points,—opposition to slavery, attachment to an inspired psalmody, and dislike of secret societies, connection with which excludes from their communion. Its ministers are 429 in number.

A large body, the *Cumberland Presbyterians*, dates its existence from 1803. It arose from a proposal to license and ordain laymen who had the gift of public utterance, in order to meet a want of regularly-trained ministers. It professes a modified Calvinism, embracing the doctrine of universal atonement, but rejecting that of eternal reprobation, and qualifying that of election. It engrafts upon its extreme Presbyterianism the itinerating system of the Methodists. It is represented by 588 ministers.

The *Lutheran* Church, now containing upwards of 400 ministers, had for its first minister Jacob Fabricius, who reached America in 1669. It received more effective organization about the middle of last century. It is essentially Presbyterian, but differs from Lutheranism in Europe by no longer insisting on the bodily presence of the Saviour in the eucharist.

Canada. In Canada, under three different synods, respectively connected with the Established, the Free, and the United Presbyterian Churches in Scotland, there are 290 ministers. In Nova Scotia and New Brunswick there are fully 120 more, under different synods; while in other British dependencies in America, such as Jamaica and Guiana, about 50 more fall to be reckoned.

Australia Presbyterianism has obtained an extensive footing in Australia, and is represented by nearly 100 ministers in connection with the three largest denominations in Scotland. In New Zealand there are about 20.

Presbyterian Churches in Scotland.

ESTABLISHED CHURCH. I. *Established Church.*—The legal position of this church, as fixed at the period of the Revolution, depends upon three acts,—a statute, 1689, c. 2, by which Episcopacy was abolished, and the Presbyterian church restored to its privileges and emoluments; another, 1690, c. 1, by which the act in favour of the royal supremacy was repealed; and a third, the most important of all, 1690, c. 5, ratifying the Confession of Faith, and establishing Presbyterian church government in Scotland. By a separate act, the right of patronage was cancelled, a pecuniary compensation awarded to the patrons, and the presentation to vacant churches assigned to the Protestant heritors and to the elders of the parish, subject to the approval or rejection of the whole congregation. The Act of Security, passed and adopted in 1707, as the basis of the treaty of union, declared the Presbyterian church government "unalterable," and "the only government of the church within the kingdom of Scotland." In 1712 the Patronage Act became law, by which the rights of lay patrons were restored. The application of this enactment in a way which, in the judgment of the Seceders, wholly neutralized the rights of the people in the appointment of ministers, gave rise to the Secession. The enforcement of it, to the extent not merely of interfering with the rights of the people, but with the spiritual jurisdiction of the church, was the reason assigned for the Disruption of 1843, by those who constituted themselves as a separate communion into the Free Church.

Two parties gradually arose after the Revolution within the pale of the church,—the one distinguished by their attachment to popular interests and liberties, and by a predilection for those doctrines which stand opposed to the theory of Arminianism; the other avowing, as the essence of their policy, "the steady and uniform support of lay patronage," and suspicious of the doctrinal views of their opponents, as tending, in their judgment, to Antinomian excess. The Marrow controversy, which turned upon the merits of a book, evangelical in the opinion of the former, Antinomian in the opinion of the latter, elicited a discordance of view amounting to an open rupture. The party intent upon enforcing the law of patronage acquired the mastery. When Mr Stark had been settled at Kinross against the wishes of the parishioners, several ministers made a representation against this course of policy. The Assembly refused to hear the petition, and dismissed the complaint against the settlement at Kinross. Feeling specially aggrieved because he had not been allowed to enter his dissent, the Rev. Ebenezer Erskine, in a sermon before the Synod of Fife, denounced the corruption of the church. His brethren sentenced him to a rebuke for his conduct; and on appeal to the Assembly, that supreme court confirmed the sentence. Mr Erskine accordingly, along with three other brethren, protested, and left the church. In spite of an attempt at conciliation by the Assembly of the following year (1734), the four brethren adhered to their position, and exerted themselves in the formation of the *Secession* church. In 1752 the Rev. Thomas Gillespie was deposed for contumacy, in refusing to assist at the ordination of an unacceptable presentee at Inverkeithing. The *Relief* church arose in consequence. Minuter details of these proceedings will be given under the account of the United Presbyterian Church. Principal Robertson, by whose resolute leadership the Assembly had been guided in them, retired from the management of the church about 1780; but the party he represented was so powerful that for a long period after his retirement they had the chief sway in the councils of the church.

The next event of importance in the history of the Established Church was a movement in favour of its extension by the erection of chapels of ease in 1795. It gave occasion to a controversy, in which the popular party conceived it sufficient to leave with the presbytery the power of deciding whether such erections should be sanctioned; while their opponents insisted on retaining for the General Assembly the final decision in every case. Another discussion arose which in successive Assemblies elicited singular powers of eloquent debate on the part of their members, till it was terminated in 1824 by an enactment against plurality of offices, inhibiting any minister from combining with a parochial charge the duties of a professorship in a university. The same year is memorable in the annals of the Assembly by the proposal of Dr Inglis to institute a mission to the heathen. The result was the important and successful mission to India, conducted ever since by the Established Church. After a brief controversy in reference to a heresy which took its name from the parish of its origin (Row), and which embraced as its chief tenet the doctrine of universal pardon, the church was agitated in 1832 by the renewal of the old struggle against patronage, through means of an overture introduced into the Assembly craving the restoration of the call, or the right of the people to a share in the appointment of their pastors, by a real and effective instead of a formal and nugatory expression of their concurrence in their settlement over them. The overture, however, was rejected. In 1833, at the instance of Dr Cook, certain churches, built and partially endowed by Parliament, were elevated to the full standing of parishes so far as ecclesiastical privileges were concerned, and their ministers admitted to the complete exercise of their official rights in the courts of the church.

In the Assembly of 1834 Dr Chalmers became convener of the committee for the extension of the church. He devoted to the scheme all the energy and resources of his character; so that, by the next Assembly he could report new places of worship, completed or in course of erection, to the number of sixty-four, while the liberality of the church had responded to his appeals by a sum of L.66,000. Within a period of seven years about 205 churches were erected. In 1836 a scheme for providing ministers and churches to the colonies was instituted. Two years later, a mission to the Jews was undertaken. The circumstances under which the Free Church arose fall to be detailed in connection with the notice of that body which follows. The church, after a prolonged and severe controversy with those who separated from it at the Disruption in 1843, justified its adherence to the position which it had assumed principally on three grounds,—the constitution of the church as regulated by the law of patronage, the decisions of the civil courts as confirming the interpretation which it put on the bearings of that enactment, and the act of the legislature, denominated Lord Aberdeen's Act, according to which, it was supposed, sufficient scope was given to the ecclesiastical courts to reject a presentee if the reasons urged against him were in their judgment valid. Within the last two years some dissatisfaction has sprung up at the working of this act, and changes have been proposed,—by one party on the act itself, by others upon the ecclesiastical regulations for carrying it into effect.

Standards. It is singular that all the Scotch Presbyterian churches owe their *symbolic books* to a convention mainly composed of English divines—the Westminster Assembly. The doctrinal standards of the Church of Scotland, as recognised by act of Parliament (1690), are simply the Westminster Confession of Faith. In some acts of Assembly the Catechisms, Larger and Shorter, receive ecclesiastical sanction, and so far as the church connects itself with the church of the first and second Reformation, it can make use of the Form of government and Directory for worship, together with the First and Second Books of Discipline, though the exact amount of authority due to these latter documents has been sometimes matter of dispute. In 1707 the Form of Process for the regulation of discipline became the law of the church.

Constitution. The *constitution* of the Established Church embraces a fourfold gradation of courts. The *kirk-session*, under the superintendence of the minister, takes charge of the spiritual interests of the parish, nominating new elders to supply vacancies in its number; but these nominees are ordained only after opportunity has been afforded to the congregation to intimate any objections to them. The *presbyteries*, 82 in number, consist equally of ministers and elders. Theological professors, when resident within the bounds, have a seat in these courts. The duties of the presbytery are, to watch over the conduct of the ministers, to examine students, to ordain to vacant parishes, and to try the qualifications of schoolmasters. In regard to secular interests—questions regarding church property,—the presbytery, according to law, is viewed as a different court, and acting in a civil capacity. The *synods*, sixteen in number, include several presbyteries. They are chiefly occupied in the duty of reviewing, in the case of appeals, any decisions of the inferior court. The *General Assembly* is the supreme court, possessed of the highest executive authority, and the source of legislation. It is representative in its constitution, consisting not of all the ministers of the church, with a corresponding elder, but of persons nominated chiefly by the various presbyteries. The presbyteries elect to serve in it 200 ministers and 89 elders, the royal burghs 67 elders, the universities 5 ministers or elders, and the churches in India 1 minister and 1 elder. There are thus in every Assembly 363 members. In every Assembly, too, a Lord High Commissioner appears as the representative of the sovereign. By an act of Assembly in 1697, an important restriction is laid upon its powers, known as the Barrier Act, by which every measure seriously affecting the forms of government and discipline must descend as an overture to the presbyteries, and can only become law when it has been approved of by a majority of them. The object of the act is to secure the church against the dangers of precipitate legislation.

Extent. The Established Church embraces 963 parish churches, including collegiate churches as one parish, 42 parlia-

Churches in Scotland

mentary churches, and 147 chapels of ease and *quoad sacra* churches. According to Sir James Graham's Act, when the concurrence of a majority of heritors has been obtained, and a competent endowment has been secured, any *quoad sacra* church may be raised to all the privileges of a regular parish. Under the operation of this act, parochial churches have been increased from 963 to 1006. Since 1843 the work of extending the church has been prosecuted with great zeal and energy, and several new churches have been erected. The large sum of L.326,406 has been raised for the purpose of endowing them, the subscriptions in order to accomplish this object amounting, in 1857 alone, to L.61,188.

Endowments.

The provision for the support of the ministry in the Established Church embraces a manse, a glebe, and stipend. Ministers in rural parishes and royal burghs have generally manses, but in cities it is otherwise. The glebe consists of arable land, generally exceeding four acres. The stipend is raised on the basis of the old system of teinds or tithes, which, when seized by the crown at the Reformation, were burdened, and continue burdened to this day, with the support of the parochial minister. The court of teinds determines the amount of land-produce to be allotted for the purpose; and under a subsequent process, or *decreet of modification*, landholders are proportionally assessed, in order to raise the whole amount thus declared to be due to the minister. Every twenty years, by an application to the Court of Session, if he can prove that the resources of the parish have increased, he may secure an augmentation of his stipend. Since 1810, by an act of Parliament, all stipends are made up out of the Exchequer to L.150. In parishes recently constituted the stipend depends upon an endowment through a fund raised by voluntary contributions.

Theological education.

The last regulations on the subject of the education required for the privilege of license and admission to the ministry are contained in an act of Assembly (1856). All the classes necessary for the degree of Master of Arts must be attended in four successive sessions,—Greek and Latin in the first session, logic and moral and natural philosophy, separately, in the three following sessions. Mathematics must be studied in a university at least for one session before the student enters the class of natural philosophy. The theological course is completed in four sessions; attendance is required for two sessions in the classes of church history, Hebrew, and biblical criticism, if such classes exist in the university to which the student belongs; while, in regard to systematic theology, he may attend three regular sessions and a partial one, or two regular, with three partial sessions.

Schools.

The care of the parochial schools has been entrusted to the Church of Scotland, as from the first the church devised and promoted the system of national education pursued in them. The right of electing the schoolmaster is vested in the minister of the parish, and all heritors in possession of land to the amount of one hundred pounds Scots. The schoolmaster is responsible for his moral conduct and professional diligence to the presbytery. According to a report submitted by the inspector to the Privy Council in 1854, the five classes of schools which follow, with the numbers of each respectively, are in connection with, and more or less under the care of the Established Church:—Parish schools, 1049; sessional, 119; General Assembly, 179; Christian Knowledge Society, 232; and Gaelic School Society, 52.

Missions.

The Church of Scotland has a mission in India, with separate stations in Calcutta, Madras, and Bombay. The missionaries, foreign and native, are about 10 in number. It maintains also missionary operations, through means of 12 labourers, among the Jews in Karlsruhe, Salonica, Cassandra, Smyrna, Voorla, Constantinople, and Alexandria.

Colonial churches.

In connection with this church there are synods in England, Canada, Nova Scotia, New Brunswick, New South Wales, and Victoria, together with presbyteries in Tasmania and Guiana, and separate congregations in different parts of the world.

Free Church.

II. *Free Church.*—This denomination—the next in size among the Presbyterian churches of Scotland—assumed distinct organization in May 1843, though it claims to represent the Church of Scotland as recognised by the state in the acts of 1592 and 1690. The causes which led to the disruption of the Established Church in 1843 are somewhat various. The movement of which it was the consummation was characterized by two stages,—the former being simply a struggle for popular rights, and the latter an assertion of the intrinsic spiritual jurisdiction of the church against what was deemed an invasion by the civil courts of its independence. It is not difficult to trace the origin of the movement. The theory of Presbyterianism implies a certain amount of deference to the popular mind: historically, the policy of the great leaders of the church, Knox, Melville, and Henderson, had been to base it upon the affections of the people, as the best safeguard against royal encroachment or aristocratic domination; and the traditional conviction of its members for generations, confirmed by the explicit doctrine of the First Book of Discipline, had been, that it was the privilege of the people to elect their ministers. Conspiring with the influence of these facts to awaken a demand for the restoration of the privilege, were the revival of evangelical feeling within the pale of the church and the rapid growth of dissent beyond it. So soon as the former spread so far as to influence the majority of the church, concession to popular right could not but follow if the evangelical party were true to their own principles, while the danger arising from the latter became more obvious when the question was distinctly raised and keenly debated as to the lawfulness of any alliance between church and state. In the controversy which arose on this point it was pleaded by the advocates of Established churches that alliance with the state was a cumulative, not a privative arrangement,—one which, without the least abatement of its liberties, simply added to all the privileges enjoyed by the church the express and formal sanction of the state; so that an Established church possessed a security for its freedom beyond any Dissenting community. It was in vain to urge this theory, however, when the yoke of patronage all too plainly indicated the thraldom under which the church was labouring. The zeal of its champions was naturally in these circumstances led to devise, as indispensable for the safety of the church, some scheme of relief from the yoke. The practical measure to accomplish this end bore the name of the Veto, and was first proposed in the Assembly of 1833 by Dr Chalmers. Since the *call*, or invitation from the people to the presentee that he should accept and fulfil the office of pastor over them, had all along been recognised as among the established forms and usages of the church even under the law of patronage, it was believed that it was still more within the power of the church to ascertain how far the people concurred in the proposed settlement, not by a positive call, but by a simple dissent. It was only, however, in the ensuing Assembly of 1834 that the motion in favour of the Veto was carried. The principle embodied in the motion is thus expressed:—"If, in moderating in a call to a vacant pastoral charge, the major part of the male heads of families, members of the vacant congregation and in full communion with the church, shall disapprove of the person in whose favour the call is proposed to be moderated in, such disapproval shall be deemed sufficient ground for the presbytery rejecting such person, and he shall be rejected accordingly." The competency of the Assembly to pass such an enactment was speedily tried before the civil courts. When a presentation to Auchterarder was issued, the call to the presentee was signed only by 3, while a protest against his settlement was signed by 287 out of 330 persons on the roll of communion. In obedience to the regulations of the Assembly, he was rejected by the presbytery. The patron ultimately took the case into the Court of Session. The discussion turned on the points, whether it was competent for the Assembly to pass such an enactment as the Veto; and if this point fell to be decided in the negative, whether any other result could follow than the forfeiture by the church, during the lifetime of the presentee, of all the civil emoluments of the benefice. By a majority of seven against five judges, it was ruled, on March 8, 1838, that the Veto Act was illegal.

The struggle at this stage took a new form; it now became resistance to civil encroachment on the spiritual jurisdiction of the church, as well as the maintenance of popular rights. Resolutions in support of the independence of the church were passed in the Assembly of 1838, and it was agreed to prosecute the appeal against the decision of the Court of Session to the House of Lords. The supreme court confirmed the decision of the inferior. The course taken by the Assembly, when it met in the following May of 1839, was to enjoin "implicit obedience to the decisions of the civil courts in regard to *civil* rights and emoluments," while it adhered to the principle of non-intrusion as "an integral part of the constitution of the church." Several cases—Lethendy, Marnoch, and others—speedily occurred in which the collision between the civil and ecclesiastical courts was renewed. In the judgment of those who formed the majority of the Assembly at this time, and who afterwards organized themselves into the Free Church, according to their protest at the disruption, the effect of the decisions in the courts of law was—1. That the courts of the church, in their spiritual functions, were coerced by the civil courts to the extent of being compelled to intrude ministers on reclaiming congregations; 2. That civil interdicts could arrest the preaching of the gospel and the administration of ordinances by the church; 3. That spiritual censures could be suspended by civil courts; 4. That deposed ministers and probationers deprived of their license could be restored to their status by a civil mandate; 5. That the right of membership in ecclesiastical courts could be determined by the civil courts; 6. That a minority of the former, in defiance of a majority, could be authorized by the civil courts to exercise spiritual functions; 7. That processes of discipline could be arrested by the civil courts; and lastly, That without the sanction of the civil courts no provision could be made for the spiritual cure of a parish, although such provision left all civil rights and patrimonial interests untouched. Smarting under such grievances, the church composed a claim of rights, which, when presented to both houses of legislature, was rejected. Various ineffectual attempts to adjust the difference had been made, and bills proposed by Lord Aberdeen and the Duke of Argyle. Prolonged and intricate negotiations to secure relief had also failed. The Assembly of 1843 arrived; and, since the government still declined to interfere, Dr Welsh, as moderator of last Assembly, proceeded, immediately after prayer, to read the protest to which we have just alluded, signed by 203 members of the court, against the lawfulness of a court met under liabilities to civil coercion in its spiritual procedure, and announcing their intention to withdraw from the Establishment. Having read the protest, he bowed to the commissioner and retired, followed by all who adhered to it, amid the deep emotion of the spectators, who could not but reverence, whatever view they took of the questions at issue, the magnanimity of men thus laying on the altar of principle the costly sacrifice of their endowments.

Extent. The number of ministers who signed the deed of demission by which they renounced all claim to their stipends, was 474. A few more were subsequently added to the list. The increase of the church has been such, that it now has upwards of 800 ministers, under 71 presbyteries and 16 synods. The congregations amount to 867.

Support. The support procured for these ministers, and for the other objects of the Free Church, is one of the marvels of Christian liberality in modern times. Before the Disruption, the members of the church had undergone but a partial training for the maintenance of Christian schemes. All at once they took rank as among the foremost of Christian churches in contributions for the support and extension of the gospel. The ministry is supported from two sources,—a common sustentation fund, from which each minister draws an equal dividend, varying according to the amount of the fund annually; and the supplementary contributions which a congregation may feel it needful to give its pastor. By the former, provision is made against the caprice of a congregation, if disposed to interfere unduly with the faithfulness of a pastor in the exercise of his office; by the latter, a stipend may be adjusted to local necessities and peculiar claims. At the close of the financial year in March 1858, the former rose to L.110,254, yielding a dividend of L.138 to each minister on the fund; the congregational fund, from which the supplements are drawn, but which at the same time covers other expenses, amounted to L.52,556. The building fund, for the erection of new churches and manses, was L.46,896; and the fund for missions and education L.56,776; besides a fund for miscellaneous objects, amounting to L.25,386. Besides their stipends, a large proportion of the ministers—about 570—occupy manses provided for them by the church.

Standards. The *standards* of the Free Church are "the several formularies as ratified, with certain explanations, by divers acts of Assembly in the years 1645, 1646, and particularly in 1647." These formularies are,—the Confession of Faith, to which subscription is exacted from every office-bearer; the Catechisms, Larger and Shorter, which are enjoined as useful for catechising; the Directory for Public Worship; the Form of Church-government and the Directory for Family Worship; which are to be used as regulations rather than tests. The Sum of Saving Knowledge is also recognised. All office-bearers, on admission to office, must subscribe a formula binding them to the Claim of Right and the Protest.

Constitution. The *constitution* of the Free Church is not materially different from that of the Establishment. There is the same gradation of courts, the ministers are chosen by the members of the church, and the General Assembly is composed exclusively of representatives in a certain proportion from each presbytery,—240 ministers and 240 elders, with two professors from each of the three theological faculties.

Schools. There are now 614 schools under the care of the Free Church, along with two normal schools. The sum raised in support of them last year was L.16,673.

Theological education. The Free Church, in regard to the education of candidates for the ministry, adopts the same course in science, literature, and philosophy with the Established Church. It has, however, three theological halls,—one in Edinburgh, another in Glasgow, and a third in Aberdeen. In session 1857–8, 127 students attended the hall in Edinburgh, 36 in Glasgow, and 24 in Aberdeen. The general course of education in theology embraces the various departments of apologetic, systematic, and exegetical theology, together with Hebrew and church history. Four sessions of attendance at the hall are required. In regard to two of them, liberty of partial attendance is granted, though seldom, only on special application, and on the understanding that two years of enrolment are given in compensation.

Missions. There are in connection with the foreign missions of the Free Church 35 ordained missionaries: 20 at various stations in India—Calcutta, Chinsurah, Bombay, Madras, Puna, Sattara, and Nagpore, assisted by 10 ordained native missionaries; and 5 at four different stations in Africa. There are 9 missionaries labouring among the Jews in Constantinople, Amsterdam, Breslau, Pesth, Frankfort, and Galatz. Besides these schemes, the Free Church has instituted evangelical operations for the benefit of the large towns, the Highlands, and various localities in the rural districts of Scotland.

Affiliated churches. There are several synods,—in Canada, Nova Scotia, New Brunswick, Eastern Australia, Victoria, and New Zealand, together with presbyteries in South Australia and Tasmania, and separate congregations in Africa, the East and West Indies, and some important cities in Europe,—all of which are in close and direct connection with the Free Church of Scotland.

UNITED PRESBYTERIAN CHURCH. III. *The United Presbyterian Church.*—The causes which led to the first secession from the Church of Scotland had existed from the memorable era of the Revolution. The first Parliament which met after that event abolished Episcopacy, and the royal supremacy in ecclesiastical affairs, ratified the Westminster Confession of Faith, together with the Presbyterian form of church government and discipline, abolished patronage, and vested the election of ministers in the heritors and elders, with the consent of the congregation. But this ecclesiastical settlement was in various respects incomplete, and disappointed the hopes of the most zealous Presbyterians. King William, who had no strong predilection in favour of any one form of church government, was anxious to conciliate both Episcopalians and Presbyterians: while, therefore, he approved of the law which restored to their parishes the ministers who had been ejected at the Restoration, he was at the same time desirous that as many as possible of the present incumbents should be allowed to retain their position in connection with the new ecclesiastical establishment. The leaders of the Presbyterian party were easily induced to acquiesce in this policy; and accordingly the General Assembly, in 1694, opened to the Episcopal ministers a wide door of admission into the national church. Great multitudes of the "curates," as they were termed, were induced, for the sake of their benefice, to transfer their respect and obedience from the bishop to the presbytery, and were received "into ministerial communion" on merely acknowledging that "the church government, as now settled by law, is the only government of this church." The better class of the Episcopalian clergy refused thus to barter their principles for a mess of pottage; and the greater part of those who conformed, amounting to several hundreds, belonged to the class described by Bishop Burnet "as generally very mean and despicable in all respects, and the worst preachers he had ever heard." The admission of these time-servers into the new establishment exercised a very injurious influence both on its preaching and its polity, and laid the foundation of those measures which ultimately led to the Secession.

At the union of Scotland and England in 1707 the Protestant religion, as by law established, was ratified, together with the Presbyterian form of church government and discipline, and the unalterable continuance of both was declared to be an essential condition of the union of the two kingdoms in all time coming. In spite of this solemn pledge, that the constitution of the national church should not be tampered with by the British legislature, the right of the people to choose their pastors was wrested from them in 1712 by the Tory government, in resentment, it has been said, of the warm attachment which the Church of Scotland had shown to the Hanoverian dynasty. It is probable, however, that the real ground of the measure was a desire to secure a more complete control over the proceedings of the ecclesiastical courts, and to render the church subservient to the designs of the government. The oath of abjuration, which was imposed about the same time, proved a fertile source of discord both among ministers and people. This oath was regarded with great jealousy, and was peculiarly obnoxious to the Presbyterian clergy, both because its avowed design was the security of the Church of England, and because it seemed to imply an approbation of diocesan Episcopacy with the ceremonies of that church, and a recognition of the Queen's supremacy in matters of religion. About a third part of the clergy, including the founders of the Secession, positively refused to swear this offensive oath, though they were enjoined to do so on pain of ejection from their churches, and of paying an exorbitant fine.

For some time after the revival of patronage in 1712, the severity of the law was greatly mitigated by the general disinclination, on the part both of ministers and patrons, to avail themselves of its provisions in opposition to the feelings of the people. But after the lapse of a few years, patrons no longer hesitated to take advantage of their legal rights, and ministers were no longer disinclined to accept of presentations although given contrary to the wishes of the congregation. On the part of the people acts of resistance to the nominees of the patrons became more frequent and more obstinate, though they were almost uniformly unsuccessful; for the ruling party among the clergy were firm in their resolution that the law of patronage should be carried into effect. They found themselves, however, placed in circumstances of peculiar difficulty; for not only were the people loud in their remonstrances against violent settlements, but a considerable party of the ministers themselves strenuously opposed the intrusion of presentees upon congregations, and obstinately refused to carry into effect the decisions of the church-courts. To obviate this difficulty, in 1729 the Assembly appointed a committee of its own number to meet and ordain the obnoxious presentee; and for a period of twenty years this expedient was resorted to in cases where the presbytery proved refractory. The excitement of the people, and their resistance to the yoke of patronage, continued to increase; violent settlements prevailed in every part of the country; and in some cases the popular feeling was so strong that it was deemed necessary to employ an armed force to carry into effect the decisions of the church-courts. At the meeting of the Assembly in 1730, there were no fewer than twelve cases of appeals on the part of congregations against the intrusion of obnoxious ministers; but the dominant party were so determined to crush all opposition to their enactments, that they not only dismissed these appeals, but solemnly enacted, at this meeting of the Assembly, that henceforward no reasons of dissent "against the determination of church judicatures" should be entered on the record; thus in the most unconstitutional manner taking away the power even of complaint. The Assembly of 1731 followed closely in the footsteps of its predecessor. By the law of patronage it was provided, that if the patron suffered six months to elapse without exercising his right of presentation, the presbytery to which the vacant parish belonged was empowered to take steps for its settlement. The presbyteries in these cases frequently gave the people the right of choosing their ministers; and with the view of destroying this last remnant of popular election, an overture was laid before the Assembly of 1731, proposing that when the right of appointment devolved upon presbyteries, the power of election in vacant parishes should belong only to the elders and Protestant heritors, and, in royal burghs to the elders, magistrates, and town-council. This overture was transmitted to the different presbyteries, that, according to the regulations of the Barrier Act, their opinion respecting it might be given at next meeting of the Assembly; and though a great majority of those presbyteries from whom reports were received expressed disapprobation of the mea-

Churches in Scotland

sure, the supporters of the overture obtained a majority of the Assembly of 1732 in its favour.[1]

Mr Ebenezer Erskine and some other ministers protested against this decision as being unconstitutional, but the Assembly refused either to receive or record their protest. Forty-two ministers then addressed a memorial to the Assembly respecting these arbitrary enactments; but the document was not even allowed to be read; and a similar remonstrance, signed by seventeen hundred elders and laymen, was treated with equal contempt.

These violent and unconstitutional proceedings excited great indignation and alarm throughout the community; and a series of events which occurred at the same time showed that the dominant party in the church were not only ready to sacrifice the rights and liberties of the people at the shrine of authority, but were indifferent, if not hostile to the fundamental doctrines of evangelical religion. The conduct of the Assembly towards the Presbytery of Auchterarder in the year 1717, with regard to what has since been denominated the Auchterarder Creed,—the vindictive proceedings against the twelve ministers, known by the name of "Marrow men," who endeavoured to check the progress of error by reprinting and circulating a celebrated treatise of the sixteenth century entitled the *Marrow of Modern Divinity*,[2]—and the unqualified condemnation of the doctrines of that work by the Assembly in 1720, presented a chilling and melancholy contrast to the leniency shown to Professor Simpson of Glasgow, who, though found guilty of teaching from the chair of theology a system of combined Arianism and Pelagianism, was merely suspended from his ecclesiastical functions, and that with undisguised reluctance, while he was continued in the fellowship of the church, and in the enjoyment of all his official endowments.

The great body of the people, together with a section of the clergy, were indignant at this rapid declension of the national church both in doctrine and discipline. In the language of the times, "the carved work thereof was broken down, and the heritage was desolate." The breach between the dominant party and their opponents daily widened, and a crisis speedily came.

Among the opponents of the arbitrary measures of the Assembly in 1732, Ebenezer Erskine, minister of Stirling, held a prominent place. Though the son of an ejected clergyman in the days of the persecution, he was descended from the Erskines of Shielhill, a branch of the ancient and noble house of Mar. He thus, as Mr Burton remarks, united those two idols of the Scottish common people, which they regretted to see so seldom in conjunction, antiquity of blood and orthodoxy of creed. He was a scholar and a gentleman, as well as a popular preacher; and his talents and learning, his faithfulness in the discharge of his ministerial duties, and his intrepidity and zeal in the cause of truth and liberty, had secured him the respect and esteem of his brethren, as well as extensive influence among the people. In the various important questions which had been agitated after his entrance into the ministry,—the abjuration oath, the controversy respecting the *Marrow of Divinity*, and the process carried on against Professor Simpson,—he had shown himself an active and fearless opponent of the measures pursued by the ruling party in the church. He was not only one of those who signed the representation of grievances laid before the Assembly in 1732, but being a member of Assembly that year, he spoke and protested against its rejection. Being at that time moderator of the synod of Perth and Stirling, he opened the meeting at Perth, on the 10th of October following, with a sermon from Psalm cxviii. 22, in the course of which he remonstrated against the act of the preceding Assembly with regard to the settlement of ministers, alleging that it was contrary to the word of God and the established constitution of the church. These statements gave great offence to several members of synod, and after the court was constituted, and a new moderator chosen, a formal complaint was lodged against him, for uttering several offensive expressions in this sermon.[3] This was done accordingly, and Mr Erskine having been heard in reply, after a hot and keen debate of three days, the synod, by a majority of six votes, found Mr Erskine censurable for some expressions in his sermon, "tending to disquiet the peace of the church, and impugning several acts of Assembly, and proceedings of church judicatories." Against this sentence Mr Erskine protested, and appealed to the General Assembly. That venerable court, which met in May 1733, affirmed the sentence of the synod. Mr Erskine, however, declared that he could not submit in silence to the rebuke and admonition, and presented a written protest, to the effect, that as the Assembly had found him censurable, and had rebuked him for doing what he conceived to be agreeable to the word of God and the standards of the church, he should be at liberty to teach the same truths, and to testify against the same or similar evils, on every proper occasion. To this protest Messrs William Wilson, minister at Perth, Alexander Moncrieff, minister at Abernethy, and James Fisher, minister at Kinclaven, gave in a written adherence. The Assembly, in accordance with the arbitrary rule which had given so much offence, refused to permit the protest to be read, and the four protesters left the paper on the table and withdrew. Here the matter would in all probability have terminated, as at that period none of the four entertained any intention of separating from the national church. But an overruling Providence had ordered it otherwise. The court had proceeded to a different business, when the protest, which had fallen from the table, was accidentally picked up by a certain Mr James Nasmyth, minister of Dalmeny, designated by a contemporary "a fiery man in the corrupt measures of that time." Upon perusing the document, he rose with great indignation, and called the attention of the Assembly to the insult which he alleged had been offered to their authority. The protest being read, a great uproar ensued, and the Assembly ordered their officer to summon the four brethren to appear at the bar of the court next day. They obeyed the citation, and a committee was appointed to retire with them in order to persuade them to withdraw their paper. The committee having reported that their persuasions had produced no effect on the minds of the brethren, the Assembly ordered them to appear before the Commission in August following, and retract their protest; and if they should not comply, and testify their sorrow for their conduct, the Commission was empowered to suspend them from the exercise of their ministry, and even to proceed to a higher censure in case of their acting contrary to the sentence of suspension.

The Commission met in August accordingly, and the four ministers still adhering to their protest, were suspended from the exercise of their office. At the meeting of the Commission in November, they were severed from their respective charges, their churches declared vacant, and all ministers of the Church of Scotland were prohibited from employing them in any ministerial function. When this sentence was intimated to the four brethren, they protested that their ministerial office and pastoral relation should be held firm and valid, that they still adhered to the principles of the true Presbyterian Covenanting Church of Scotland, though they were now obliged to "MAKE A SECESSION from the prevailing party in the ecclesiastical courts, and that it should be lawful for them to preach the gospel and discharge all the duties of the pastoral office according to the word of God, the Confession of Faith, and the constitution of the Church;" and they concluded their dignified protest by an appeal to "the first free, faithful, and reforming General Assembly of the Church of Scotland."

---

[1] Reports were received from forty-nine presbyteries; six approved of the overture without alteration, twelve on condition that certain important amendments were introduced, while thirty-one gave it their unqualified condemnation. Eighteen presbyteries gave in no report.

[2] The author of this famous treatise was Edward Fisher of Brazenose College, Oxford.

[3] The persons who took the lead in moving for investigation were, Messrs Adam Ferguson, minister at Logierait; James Mercer, minister at Aberdalgie; James Mackie, minister at Forteviot, afterwards at St Ninians; and the Laird of Glendoig, ruling elder.

The Secession properly commenced at this date. A few weeks after their expulsion from the national church, the four brethren met at Gairney Bridge, a small hamlet in the neighbourhood of Kinross (5th December 1732), and formally constituted themselves into a presbytery. In the new and trying circumstances in which they were placed they conducted themselves with great caution and prudence. Anxious to avoid everything like rashness or precipitancy, they resolved to hold their meetings chiefly for prayer and religious conference, and to defer proceeding to any judicial acts till they should see whether the ecclesiastical courts would retrace their steps.

Meanwhile the harsh and unjust treatment of the four brethren had excited great agitation throughout the country. The mass of the people regarded Mr Erskine and his associates as sufferers for the cause of truth and religious freedom. Many of the clergy themselves sympathized with the Seceders, and the sentence against them had been carried only by the casting-vote of the moderator or chairman of the Commission. The ruling party felt that in their eagerness to crush opposition, they had gone too fast and too far, and they now saw the necessity of making some concessions in order to allay the public agitation, and prevent the spread of disaffection and schism. When therefore the Assembly met in 1734, it was seen that a considerable re-action had taken place in that body. When the Commission-book was examined, there was some marked reservations made in the approval of its proceedings. The act of 1730 forbidding church-courts to record dissents and protests, and the act of 1732 respecting the settlement of vacant parishes, were repealed. The Commission was directed to petition his Majesty and the Parliament for the repeal of the Patronage Act; and the Assembly authorized the Synod of Perth and Stirling to restore the ejected ministers to their respective charges and ministerial position.

It was supposed that the dispute between the Seceders and the Assembly was now amicably settled, and to show that the reconciliation was sincere, the Presbytery of Stirling elected Mr Erskine their moderator, and sent a deputation to request him to accept the office. The four brethren, however, were not satisfied that it was their duty to return to the bosom of the church from which they had been ejected. Their strong attachment to the church of their fathers had kept them within its pale, although feeling deeply day by day that it was rapidly degenerating both in doctrine and discipline. But now that they had been expelled from its communion for their fidelity to the cause of truth and justice, they at once took their stand upon the original constitution of the Scottish Establishment, and thus put an impassable gulf between them and the men who swayed the counsels of its degenerate successor. They were of opinion that the reforms which had been made by the Assembly of 1734 were dictated merely by policy and by no real regard for the cause of truth. The sentence against them had indeed been rescinded, not, however, because it was unjust, but simply because it was inexpedient, for the synod was expressly forbidden to "judge of its legality or formality." They were therefore treated merely as pardoned offenders, not as the vindicators of the principles and constitution of the church; and they had no security against a repetition of the unconstitutional and sinful acts against which they had testified. After long and careful deliberation, therefore, they were unanimously of opinion that it was their duty to remain in a state of separation till they should see unequivocal and decided evidence that the course of defection was in reality abandoned. "Some brethren call upon us to come in and help them against the current of defection," said Ebenezer Erskine, "but now that the hand of Providence has taken us out of the current against which we were swimming, and set us upon the reformation ground, by a solemn testimony and constitution, it would be vain for us to endanger ourselves by running into the current again, unless our reverend brethren who call for our help can persuade us that our doing so will turn the current and save both them and ourselves, and so preserve the Lord's work and testimony."[1] On forming themselves into a presbytery in 1733, they drew up what was termed an extrajudicial Testimony to the doctrine, worship, and government of the Church of Scotland, together with a statement of the grounds of their secession. But now assuming a loftier tone, they prepared a document setting forth the reasons of their refusal to abandon their separate position, and stating the terms on which they were willing to return to the bosom of the Establishment.

The proceedings of the Assemblies of 1735 and 1736 seemed to the seceding ministers fully to justify the opinions which they had formed respecting the measures adopted by the Assembly of 1734, and to dispel, for the time at least, all hopes of a reunion with the Established Church. They therefore proceeded to exercise "judicial powers" as a church court, published "A Judicial Testimony," and organized churches in various parts of the country. In 1737 the celebrated Ralph Erskine of Dunfermline, brother of Ebenezer Erskine, and three other ministers, abandoned the Establishment, and joined the "Associate Presbytery," which now consisted of eight clerical members. Numerous and urgent applications for supply of sermon having been received from nearly all the lowland districts of Scotland; and the Seceders having now renounced all hopes of a reunion with the national Church, resolved to adopt measures for extending and perpetuating the benefits of the Secession. Accordingly, Mr Wilson of Perth, a person of great ability and learning, was chosen professor of divinity, and entrusted with the education of candidates for the ministry. These measures necessarily produced a complete separation between the Seceding ministers and the Establishment. They were cited to answer for their conduct at the bar of the Assembly in 1739, and obeyed the summons, appearing before the court as a constituted presbytery, and formally declined the Assembly's authority. The court was startled at this "unparalleled boldness;" and though it declared the refractory ministers worthy of deposition, did not venture to pronounce sentence against them till next year, when they were all deposed, and ordered to be ejected from their churches. But though deprived of the position and emoluments connected with the Establishment, they all continued to discharge the duties of their office in their respective congregations, who zealously adhered to their ministry, erected places of worship for them, and provided for their support. Meanwhile, cases of violent settlements of ministers increased throughout the country; and the opposition of the parishioners was frequently so formidable and popular, and the excitement so great, as to render the attendance of a guard of soldiers necessary at ordinations. These contests had of course a powerful influence in swelling the ranks of the Seceders. Had they been men "after this world," skilful in devising and carrying out schemes for the organization of masses of men, there can be little doubt that, notwithstanding the hostility of the nobles and gentry, they might, by dexterous management, have induced the great majority of the middle and lower classes to abandon the Establishment and join the cause of the Secession. Even as it was, without any plan or organized system for the extension of their cause, it rapidly "grew and multiplied." New accessions were made to them from all quarters. Upwards of seventy applications for sermon were made to the Associate Presbytery during the years 1737–38. Young men were licensed to preach the gospel in connection with the Secession. Some even of the probationers of the Established Church joined the new body; and their theological hall was in such a flourishing condition, that in the year 1741 it was attended by a greater number of candidates for the ministry than any of the Scottish universities except Edinburgh. The presbytery speedily expanded into a synod, consisting of thirty settled congregations and sixteen vacancies, and held its first meeting at Stirling in 1745–46, the memorable year of the Rebellion.

---

[1] Letter from the Rev. Ebenezer Erskine to the Presbytery of Stirling.

The progress of the Secession, however, was greatly impeded by an unhappy controversy which arose at this time respecting the religious clause of the oath taken by burgesses in Edinburgh, Glasgow, and Perth. One party insisted that no Seceder should be allowed to swear this oath, as it was utterly inconsistent with the Secession Testimony; while the other urged that it should be made a matter of forbearance. "So sharp was the contention between them," that at the meeting of synod in April 1747, after several long and stormy discussions, an entire separation took place between the contending parties. Seldom has the truth of Father Paul's remark been more strikingly verified,—"In verbal contentions, the smallness of the difference often nourishes the obstinacy of the parties." Those who condemned the swearing of the burgess oath as sinful were called "Antiburghers," and the other party who contended that it should be declared not to be a term of communion were designated "Burghers." The latter made various attempts to bring about a reconciliation with the opposing party, but without success. The "Antiburghers" not only refused to agree to a proposal that they should hold a general meeting for prayer and friendly conference, but ultimately went the length of passing sentence of deposition and excommunication, with all due formality, on Messrs Ebenezer and Ralph Erskine, James Fisher, and the other ministers who had adopted the opposite views respecting the swearing of the burgess oath. A furious controversy raged between them for a number of years, both from the pulpit and the press. In the course of time, however, this hostility subsided; a feeling of cordiality gained ground; and after a separation of upwards of seventy years, the two bodies were again united into one.

These divisions among the Seceders afforded an excellent opportunity to the dominant party in the national church to have regained their lost influence with the people; but instead of availing themselves of it to check the progress of the Secession, they only became more hostile to the doctrines of evangelical religion, and more resolute in enforcing the law of patronage. "The language of the majority in Assemblies at this time," says the late Sir Henry Moncrieff, "universally was, that the secession from the church, instead of increasing, was on the decline, and that the superior character and talents of the Established clergy were gradually weakening its resources, and would ultimately exhaust them. Experience has not verified these sanguine expectations. At the distance of a few years after Dr Robertson retired, the people, disgusted with unsuccessful processes before the Assembly, relinquished the plan of their predecessors, and came seldom to the Assembly with appeals from the sentences of the inferior courts appointing the settlement of presentees whom they resisted. But they began to do more quietly, or with less observation than formerly, what was not less unfriendly to the Establishment. In ordinary cases they now leave the church courts to execute their sentences without opposition, and set themselves immediately to rear a meeting-house, which very frequently carries off a large portion of the inhabitants of the parish."[1] This state of comparative quiescence, however, was not produced without long and severe struggles for many years: the disputes in the church courts respecting the settlements of ministers were incessant. In the year 1751, an unpopular minister having been presented to the church and parish of Inverkeithing, the great body of the parishioners protested against his settlement amongst them, the presbytery of Dunfermline refused to induct him, and the synod of Fife proved equally refractory. The case was brought before the Assembly of 1752, and, mainly through the influence of Dr Robertson, it peremptorily enjoined the Presbytery of Dunfermline to proceed with the settlement of the presentee, and ordered all the members of presbytery to attend on that occasion. Six ministers who absented themselves, from conscientious scruples, were brought to the bar of the Assembly; and one of them, Mr Thomas Gillespie, minister of Carnock, near Dunfermline, was immediately deposed; three others were deprived of the power of sitting in all church courts except their own sessions. This tyrannical and most disgraceful proceeding led to another secession from the Established Church. Mr Gillespie, notwithstanding his deposition, continued his ministrations in the neighbouring town of Dunfermline; and a few years after, he and a son of the celebrated Thomas Boston of Etterick, and a Mr Collier, formed themselves into a presbytery, and became the founders of that numerous and respectable body of Dissenters entitled the *Synod of Relief* (now merged in the United Presbyterian Church), formed for the purpose of giving RELIEF to oppressed Christians from the yoke of patronage and the tyranny of the church courts.

The downward progress of the Established Church, both in doctrine and in discipline, still continued. The fundamental doctrines laid down in its standards were denied by many of its ministers, and Pelagian and Socinian errors were openly taught by them, both in the pulpit and through the press. At length Principal Robertson himself became alarmed at the proceedings of his followers, and retired from the leadership of the Assembly in 1781, partly at least, if not mainly, because a section of the "moderate party" insisted on getting rid of the Confession of Faith altogether. In these circumstances it is not to be wondered at that the spirit of disaffection continued to spread among the members of the Establishment, and that the Seceders rapidly increased in numbers, in spite of the strife that prevailed among themselves at this period. Not only did the Associate Synods steadily extend their influence in Scotland by the accessions which they were constantly making to the ranks of their adherents, but they sent preachers to England, to Ireland, and even to America, and erected a considerable number of Secession congregations in these countries.

Towards the close of the eighteenth century the tranquillity of the Associate synods was again disturbed by a controversy respecting the power of the civil magistrate in matters of religion, and the perpetual obligation of the national covenant. A great majority in both synods abandoned the old ground held by the early Covenanters; denied the right of the civil magistrate to interfere with the church, and of the church to accept the support of the state; declared that the power of the church is wholly spiritual, while the end of civil government is the public and temporal good of civil society; that neither of these kingdoms has power over the other; that the church has no civil authority, and the magistrate no spiritual jurisdiction. These principles, thirty years later, led to what is called the "voluntary controversy," which raged fiercely for several years, and has exercised a most momentous influence upon the religious condition of Scotland. In consequence of these "New Light" views, as they were termed, a small party who held the opinions stated in the Confession of Faith respecting the right and duty of the civil magistrate, seceded from both synods. Dr M'Crie, the able and learned biographer of Knox and Melville, and several other ministers, quitted the Antiburgher Synod on this ground in 1804, and formed themselves into a distinct presbytery. A few years earlier the Burgher Synod agreed not to require from their ministers an approbation of those "parts of their standard-books which have been interpreted as favouring compulsory measures in religion," or of "the obligation of the national covenants upon posterity." Three ministers protested against this decision, constituted themselves into a distinct presbytery, and became the founders of the "Original Burgher Synod," which in 1839 returned into the bosom of the national church. An attempt was made by these separatists to obtain possession of the property of the synod, on the alleged ground, that the latter had abandoned the principles which their predecessors in the Secession had always maintained. An appeal to the courts of law was made on this point by one of the ministers and a portion of the Associate congregation of Perth, who had joined the "Old Light" party, and claimed the exclusive possession of the manse and place of worship. After a long and expensive litigation, in the course of which the process was carried from the inferior courts to the House of Lords, and thence remitted back to the Court of Session, it was ultimately decided that the pursuers had separated from the congregation to which they belonged without any sufficient cause, and that they had consequently no right to disturb the defenders in the possession of their property. The question was one of great importance, and the principle laid down in this instance by Lord Chancellor Eldon as the ground of judgment has ever since been regarded as the settled law of the country in all similar cases.

---

[1] Appendix to *Life of Dr Erskine*, by Sir H. Wellwood Moncrieff, Bart., p. 464.

No other event of much importance occurred in the history of the Secession Church till the period when the two great branches of which it was composed were again happily united into one on the 8th of September 1820, in Bristo Street church, Edinburgh,—the spot where, seventy-three years before, the separation had taken place. Ten ministers of the General Associate, or Antiburgher Synod, refused to concur in the union, and soon after formed a junction with Dr M'Crie, Professor Bruce, and the other ministers who withdrew from the same synod in 1806. This highly respectable body assumed the name of "the Associate Synod of Original Seceders," and ultimately consisted of four presbyteries and thirty-six congregations.

The only other incident that remains to be noticed is the union between the Secession and Relief Churches. Negotiations for this purpose were commenced in 1835. A scheme of union was agreed on in 1840; but it was not consummated till the 13th of May 1847 in Tanfield Hall, Edinburgh,—the scene, four years previously, of the first Assembly of the Free Church of Scotland. The designation of the combined bodies is the United Presbyterian Church. The United Presbyterian Church has the same standards, the same Confession of Faith and Catechisms, the same form of government and ritual, as the Established Church. It has also lay elders, sessions, and presbyteries; but instead of a General Assembly, its supreme court is a general synod, composed of all the ministers having charges, with an elder from each session. The conditions of membership are a credible and intelligent profession of the faith of Christ, accompanied by a corresponding character and deportment. All the members of the church, without distinction of office or rank or sex, have a right to vote in the election of ministers and other office-bearers, and in the management of congregational affairs. Only members in full communion are permitted to observe the Lord's Supper, which is celebrated at least four times a year in nearly all the congregations. Baptism is administered in the church, unless in special cases, and only to the children of members in the full possession of their privileges. A formula, closely resembling that of the Established and Free churches, is employed at the licensing of the preachers, and the ordination of the ministers, of the United Presbyterian Church; but they "are not required to approve of anything in the standards of the church which teaches, or is supposed to teach, compulsory or persecuting and intolerant principles in religion."

Theological Education.

The education of candidates for the ministry has always been reckoned a matter of the greatest importance by the United Presbyterian Church. The course of preliminary training is very nearly the same as that adopted by the Establishment. Students must attend at least four sessions at one of the national universities, and the course of preparatory study includes Latin, Greek, logic, moral philosophy, mathematics, natural philosophy, and Hebrew. The divinity hall meets annually in August, and continues for eight weeks. There are five chairs of theology,—viz., sacred languages and Biblical criticism, hermeneutics and evidences, exegesis, systematic and practical theology, and ecclesiastical history, comprehending the history of doctrine, ritual, and government. The term of study is five years. During the vacation, the students are under the superintendence of their respective presbyteries, who examine them as to their progress in their studies, and hear and criticise their trial discourses. The number of students attending the hall is nearly 200. The United Presbyterian Church consists at present (1859) of 32 presbyteries and 528 congregations; the membership amounts to 152,622, the attendance in the churches to 181,279, the annual baptisms to 8603. Including children, about a fifth part of the population of Scotland is connected with this church.

The annual congregational expenditure is L.122,890, and the expenditure for missionary and benevolent purposes is L.39,310; making together L.162,200.

Finance.

There are 1350 Sabbath-schools and Bible-classes, attended by 76,942 scholars.

The sum of L.15,541 was raised last year, and L.170,000 during the last twenty years, for the liquidation of debt, while nearly L.120,000 has been contributed during the same period for the erection of new churches and manses. The stipends of the ministers vary from L.100 to L.550 a year. In nearly all the country congregations a manse is also provided.

Affiliated Churches.

There is a large and prosperous branch of the United Presbyterian Church in Canada, consisting of 7 presbyteries and upwards of 60 congregations, with a theological seminary of its own. In connection with the United Presbyterian Church there are also a considerable number of missionary congregations in Jamaica, Trinidad, Old Calabar, and Caffraria. Upwards of a dozen congregations have recently been established in Southern Australia; and four missionaries are about to be sent to India. The Irish branch of the Secession Church, consisting of 9 presbyteries and 134 congregations, was merged some years ago in the Presbyterian Church of Ireland.

EFORMED PRESBYTERIAN HURCH.

IV. *Reformed Presbyterian Church.*—This church has sometimes been known by the designation "Cameronians," from Richard Cameron, which, however, it rejects, as he was in no sense the founder of the body. On the contrary, in virtue of its adherence to the principles of the covenants, it claims connection with the earliest Presbyterianism of Scotland. By an act of Parliament in 1649, and by a corresponding act of the General Assembly in the same year, allegiance to the king was conditioned on his faithful adherence to the principles on which he should receive the crown, and according to which he should engage to rule. It is declared in the latter deed that he could not be admitted to the exercise of his government until he had given satisfaction in regard to the religion and liberties of the kingdom. He agreed accordingly to take the covenant, and to establish Presbytery. Afterwards, when he established Episcopacy, and put the covenants under the ban of the acts rescissory, a large body of the Presbyterians conceived that, having broken compact with the nation, he could no longer be regarded as a constitutional sovereign, and had forfeited all claim to their obedience. To this effect they issued a declaration at Sanquhar in 1680. It was with them, accordingly, a struggle for constitutional government, as clearly appears from a similar document subsequently issued at Lanark, in which, after declaring, "although we ought to take in good part whatever God in his infinite wisdom hath, for the punishment of our sins, carved out to us, and although we always ought to acknowledge government and governors as ordained by him, in so far as they govern according to the rules set down by him in his Word and *the constitutive laws of the nation*, and ought to cast the mantle of love on the lesser errors of governors, and give the best countenance to their administration, that the nature of their actions will bear; yet when all these laws, both of God and the kingdom, conditional and constitutive of the government, are cassed and annulled," they proceed, having enumerated their grievances, to affirm that, to yield "implicit submission" to the royal will, as "an absolute and sovereign rule," would be "to destroy themselves and betray posterity." In 1681 they were organized into various societies, maintaining close correspondence. When the ministers to whose preaching they listened were cut off by the sword of unrelenting oppression, James Renwick was sent to receive ordination from the Dutch clergy. On his return, he wielded considerable influence over the societies. Endowed with no common gifts of winning eloquence, together with fervent piety and amiable dispositions, he secured the attachment of his followers, and revived the enthusiasm of the nation in behalf of the principles of the Reformation. The only document of authority issued by the societies—the Informatory Vindication—was prepared chiefly by Renwick; and it is but fair that their opinions should be judged of from it, rather than from the hasty and unauthorized expressions of individuals,—the more especially as in this very document they complain that prejudices had been created against them in this way, by the "extravagances" into which some of their number had fallen through "overmuch rigidity and strictness." As to their relations to the government, they intimate their intention to take up arms only in self-defence; and as to the abettors of the prevailing tyranny, they affirm, "not that we would martially oppose and rise up against all such, but by our profession, practice, and testimony, we would contradict and oppose them; we positively disown, as horrid murder, the killing of any because of a different persuasion and opinion from us." They have been blamed, moreover, for narrow views and extreme bitterness of feeling towards brethren from whom they separated, and towards the members of other churches. On the contrary, they speak of men who had complied so far with the demands of the government as brethren "whom they love in the Lord, and acknowledge to be ministers of his church," and "with whom they would not refuse accidental or occasional communion, as brethren and Christians;" and on the subject of communion they express sentiments which would be accounted generous and catholic, even when tested by the light of modern opinion. Discriminating ecclesiastical from catholic union, they enunciate the broadest views in regard to the latter, expressing a willingness to associate in common religious enterprises, "with some as *Christians*, holding the same fundamentals;" "with others, on stricter conditions, as *Protestants;*" "and with others, on yet stricter conditions, as *covenanted* brethren." The statement applies to "saints, whether they be natives or foreigners." So far were these men from holding, as has been alleged, that Calvinistic and Lutheran churches abroad were little better than synagogues of Jesuits.

It was from the ranks of this body that, at the Revolution, the armed companies were derived to which the Convention of Estates owed its safety and undisturbed freedom in the prosecution of its deliberations. They held in check the violence and plots of Claverhouse, and when disbanded, they received for their intrepid services the public thanks of the convention. "As these people," says the historian Crookshanks, "however reproached by their enemies as the cold, antimonarchical, enthusiastic, lunatic Cameronians, were among the first in Scotland who took up arms for the Prince of Orange, so they were the first men in Scotland that petitioned the Convention of Estates to place the crown of Scotland on the head of their deliverer King William." At a later period, in a single day, "without beat of drum or expense of levy-money," they raised a regiment of 800 men, who, marching under Cleland to Dunkeld, defeated General Cannon at the head of 5000 soldiers, and by their gallant defence of that village, retrieved the disgrace of Killiecrankie. On mature consideration, however, the societies did not feel themselves at liberty to accede to the church, as established by law at the Revolution. They went so far as to petition the General Assembly to take into consideration the difficulties under which they conscientiously laboured. The Assembly refused to allow their petition to be read. On several grounds, such as the continuance on the statute-book of the acts rescinding the second Reformation, the undue control exercised by the state in the settlement of the church, and the restrictions which, in their belief, were laid upon the liberties and the independence of the latter; they held aloof from the Established Church, while the re-establishment of Prelacy in England and Ireland, as an essential part of the civil constitution, together with the absence of such a formal guarantee as the covenants for the rights and liberties of Presbyterian Church, kept them from entertaining such confidence in the government that they could take oaths to it of unqualified approbation and support. To the present day, their descendants labour under similar difficulties. The Reformed Presbyterian Church, it will be seen, is not founded merely in antagonism to other churches on account of evils in their constitution or administration, because in date it precedes them. Its position is determined by a question of doctrine. Its adherents, while repudiating, even in documents so early as the Informatory Vindication, the error that dominion is founded in grace, attach importance to the headship of Christ over the nations, and believe that whatever civil constitution is not adjusted in harmony with this scriptural principle is to that extent without a claim upon their allegiance. They find that the British constitution, since the statute of Henry VIII., invests the monarch with perfect control in the government and discipline of the Anglican Church, and involves, in the language of the German historian Gervinus, the anomaly of "a royal Pope," with the single reservation of sacerdotal powers and functions. As it is upon the footing of adherence to the coronation oath, in which the monarch engages to uphold this system, that the oath of allegiance is sworn, Reformed Presbyterians can neither, as consistent Presbyterians, take it themselves, nor employ others as their representatives in taking it. Hence their distinctive and peculiar standing among the churches of the land.

The Rev. John M'Millan, minister of the parish of Balmaghie, was deposed in 1707, with summary rigour, for holding principles akin to those of the societies. Repudiating the validity of his sentence, he joined them, and, after a long interval, a presbytery was formed in 1743. The church increased, till, in 1811, a synod was constituted, under which there are 6 presbyteries, with 36 ministers and 45 congregations. The membership may be estimated at 6000. The annual contributions for religious purposes reported at last synod, and exclusive of congregational funds not reported, amounted to L.6000. The standards of the church are the Westminster Confession of Faith, the Catechisms, Larger and Shorter, and a Testimony authorized and issued by the synod in 1839. It has three missionaries to the heathen in the New Hebrides, and one to the Jews in London. In Ireland there are two synods, holding identical views with the Scotch synod; while in America there are two synods, and in Northern India a presbytery, bearing the same designation, and professing the same views. All these synods have separate theological halls. In Scotland, the general curriculum for the students is the same as in the other Presbyterian churches. In theology, systematic and exegetic, they must attend five complete sessions, of two months each, in successive years, under two professors.

V. *Original Secession.*—In consequence of the rupture in the Secession Church of 1747, on the subject of the burgess oath, one division had assumed the name of "The General Associate or Antiburger Synod," as opposed to "The Associate or Burgher Synod." In 1806 four ministers, among whom is the honoured name of the historian M'Crie, left the former body, on the ground that, in a Narrative and Testimony recently emitted, they had somewhat compromised the duty of the magistrate in support of religion. On effecting a union with some brethren who could not accede to the union of the two main bodies of the secession in 1820, they assumed the name of "The Associate Synod of Original Seceders." By a narrow majority, this synod resolved to merge in the Free Church, and in the course of 1852 was received into its fellowship. The minority continues a distinct body, under the name of "The Synod of United Original Seceders." They adhere to the original principles of the Secession, and attach such importance to the covenants, as to decline all ecclesiastical fellowship with churches which do not recognise their descending obligation on posterity. The synod comprehends 4 presbyteries, with 22 ministers and 29 congregations. They hold by the Westminster standards, and the Testimony originally adopted by the synod in 1827. Their divinity hall is in Glasgow. Although circumstances have prevented them from instituting a mission to the heathen, it is from no lack of zeal in such a cause, and they are committed to resolutions in its favour, on which they are ready to act as soon as an opportunity for carrying them into effect transpires.

(W. H. G.)

PRESCOT, a market-town of England, in Lancashire, 8 miles E. of Liverpool, and 198 N.E. of London. It stands on an eminence, and is a straggling place, consisting of one long street on the road between Liverpool and Manchester. The parish church, an ancient building with a lofty modern spire, is a very conspicuous object, not only in the town, but in the whole of the adjacent country. The Primitive Methodists, Wesleyans, Independents, and Unitarians have also churches in the town. A grammar school (founded in 1792, and having in 1852, 90 pupils), a girls' school, and an infant school, are the principal educational establishments here. Prescot has also a town-hall, a prison, several alms-houses, and a mechanics' institute. The principal manufactures of the town are those of watch-making tools, and the more delicate parts of watch machinery, for which Prescot has long been famous; files of excellent quality and engravers' tools, as well as coarse pottery, are also made; and there are here rope-works and cotton-spinneries. Coal mines are worked in all parts of the surrounding country. The chief supply of coal for Liverpool is obtained from these collieries. Markets are held here twice a week, and there are also several fairs. Pop. (1851) 7393.

PRESCOTT, William Hickling, a famous American historian, born at Salem, Massachusetts, on the 4th of May 1796. The first of the family of whom any record remains was John Prescott, an English blacksmith and millwright, who settled at Lancaster, New England, in 1640, and who used to take the field against Indian marauders in a helmet and breast-plate which he had brought with him from home. His grandson Benjamin was a man of influence and consideration in the colony of Massachusetts, and long represented Groton in the colonial legislature. William, the second son of Benjamin, after serving in his youth for a few months in the French war, spent the greater part of his life in farming his paternal estate at Pepperell. On the breaking out of the war of independence, at the age of forty-five, he quitted the plough for the sword, and fought in the republican ranks, where he attained the rank of colonel. He had the honour of leading his countrymen at the battle of Bunker's Hill, and of being called by Washington "Prescott the Brave." His only son William followed the legal profession, and both as an advocate and as a judge was esteemed one of the most eminent lawyers of his day. By his wife Catherine, daughter of Thomas Hickling, long United States consul at the Azores, Judge Prescott became the father of the historian. In 1808, when the boy was in his twelfth year, the family removed from Salem to Boston. In the latter city young William Prescott was placed in the academy of Dr Gardiner, a pupil of the famous Dr Parr. In 1811 he entered Harvard College, and graduated there in 1814. The classical attainments acquired through his university career gave promise of future excellence. His studies were, however, interrupted by what, to many men, would have proved a severe calamity. In the college dining-hall, a playful classmate threw at him a crust of bread, which struck one of his eyes. With that eye he never could afterwards do more than distinguish light from darkness. By the injury, the other eye was also sympathetically affected, and for many months he was shut up at home, suffering great pain, in a dark room. "In all that trying season," said his mother in after years, "I never groped my way across the apartment to take my place by his side, that he did not greet me with some hearty expression of good cheer, as if we were the patients, and it were his place to comfort us." Although the injury to the destroyed organ became in time hardly perceptible, the remaining eye was permanently weakened; and Prescott, finding himself unfit for any pursuit in which strong eyesight was indispensable, relinquished his intention of adopting the law as his profession. His father having inherited a sufficient fortune, which his practice at the bar had greatly increased, he was happily in a position of social independence. Soon after leaving college he was recommended to travel for advice, and for the benefit of his health. Crossing the Atlantic, he visited London and Paris, and consulted the best oculists there; but found that his case was one which their art had little power of relieving. From the pleasures and advantages of travel the weak state of his eyes in a great degree debarred him; but he went over a considerable portion of England, France, and Italy; and he resided for several months at Rome and Naples, where he chiefly employed himself in examining the remains of antiquity, and in reviewing the classical reading of his youth. Excepting Belgium, he never beheld with his bodily eye any of the countries, either in Europe or America, which his pen has painted so well, and with which his name will be inseparably connected. After an absence of two years, he returned to Boston in improved general health, but with eyesight, as was now obvious, permanently impaired. He soon after married Susan, daughter of Thomas C. Amory, one of the most eminent merchants of Boston, and settled down in his father's family. From 1817 Judge Prescott inhabited till 1844, when he died, an old-fashioned house in Bedford Street. It was a square edifice of brick, and painted yellow, standing alone amongst some fine elms and chestnut trees. Here the future historian commenced a life of literary labour which was rarely interrupted. "I had early conceived," he said, in a letter to a friend in after years, "a strong passion for historical writing, to which perhaps the reading of Gibbon's autobiography contributed not a little. I proposed to make myself an historian in the best sense of the term, and hoped to produce something which posterity would not willingly let die. In a memorandum-book dated so far back as the year 1819, I find the desire intimated; and I proposed to devote ten years of my life to the study of ancient and modern literature, chiefly the latter; and to give ten years more to some historical work. I have had the good fortune to accomplish this design pretty nearly within the limits assigned." In the pursuance of this plan, he was very methodical in the apportionment of hours as well as years, and rarely allowed his arrangement to be interfered with. He rose early, walked for half an hour before breakfast, and dined at half-past two. Five hours a day he passed at work in his study; three hours, broken by half an hour's walk before dinner, and two in the evening, from six to eight. He took a good deal of exercise on foot and on horseback, generally walking and riding alone; a peculiarity which he shared with his father. Although social in their habits and tenderly attached to each other, it was observed that the judge and his son, in setting out at the same moment for a walk or a ride, generally went different ways.

For some years after his return home Mr Prescott employed himself in the study of French and Italian literature. Of Italian literature he became exceedingly fond, and for some time he contemplated undertaking its history; a scheme which, however, he eventually abandoned on account of the great amount of reading which it involved. The valuable papers which he contributed to the *North American Review*, and which have several times been printed in a collected form, in some degree mark the amount of his studies. The first of these was an essay on "Italian Narrative Poetry," published in October 1824; the last, a review of Mr Ticknor's *History of Spanish Literature*. He also wrote in 1834, for Sparks' *American Biography*, a pleasing Life of Charles Brockden Brown, which likewise appears amongst his *Critical and Historical Essays*.

To the serious study of the language, literature, and history of Spain he did not devote himself until 1825, when he began to lay the foundation of that fine series of historical writings upon which his fame rests. After much reading and deliberation, he fixed upon the reign of the Catholic sovereigns Ferdinand and Isabella as the subject of his first work. These great rulers, under whose wedded sceptres Castile and Aragon became one monarchy, the remarkable group of personages who surrounded their thrones, including Cardinal Ximenes, the great captain, and Columbus, and the spirit-stirring events which made their reign so glorious for Spain and so important in the annals of the world, might at that time have been said almost to have escaped the notice of English writers. The story of Columbus had indeed been told by Robertson with a grace which compensates the defects of a narrative, of which the meagreness and inaccuracy are to be ascribed to the want not of diligence but materials. But the rest of the field was ground almost untrodden by English, French, or German writers. What little had been written on the subject in these languages had been taken almost exclusively from Italian authorities. To the rich materials afforded by the neglected Spanish chronicles of the fifteenth and sixteenth centuries there had been lately added many new and valuable stores, the fruits of the patient toil of several modern Spaniards, who were rather makers of historical collections than writers of history. Mr Prescott's choice was therefore eminently happy, both as regards the interest and the freshness of his subject, and the abundance of choice materials. He commenced his work in 1827. The remarkable difficulties which lay in his way, and the patient resolution with which they were overcome, renders this work memorable in literary history. Its progress may therefore be traced with some minuteness in the language, as far as possible, of a letter written by Mr Prescott himself in later years, when that slow and painful progress had become a portion of his triumph. For some years his eyesight had been sufficiently strong to admit of his using it for several hours a day in reading. He had already accumulated a considerable number of books and manuscripts relating to the period of which he was about to treat. A still larger number purchased for him in Europe were on their way to Boston. "But just before these materials arrived," he wrote, "my eye had experienced so severe a strain that I enjoyed no use of it again for reading for several years. It has indeed never since fully recovered its strength, nor have I ever ventured to use it again by candle-light. I well remember the blank despair which I felt when my literary treasures arrived from Spain, and I saw the mine of wealth lying around me which I was forbidden to explore. I determined to see what could be done with the eyes of another. I remembered that Johnson had said, in reference to Milton, that the great poet had abandoned his projected History of England, finding it scarcely possible for a man without eyes to pursue a historical work requiring reference to various authorities. The remark piqued me to make an attempt.

"I obtained the services of a reader who knew no language but his own. I taught him to pronounce the Castilian in a manner suited, I suspect, much more to my ear than to that of a Spaniard; and we began our wearisome journey through Mariana's noble *History*. I cannot even now call to mind without a smile the tedious hours in which, seated under some old trees in my country residence, we pursued our slow and melancholy way over pages which afforded no glimmering of light to him, and from which the light came dimly struggling to me through a half-intelligible vocabulary. But in a few weeks the light became stronger, and I was cheered by the consciousness of my own improvement; and when we had toiled our way through seven quartos, I found I could understand the book when read about two-thirds as fast as ordinary English. My reader's office required the more patience; he had not even this result to cheer him in his labour.

"I now felt that the great difficulty could be overcome, and I obtained the services of a reader whose acquaintance with modern and ancient tongues supplied, so far as it could be supplied, the deficiency of eyesight on my part. But though in this way I could examine various authorities, it was not easy to arrange in my mind the results of my reading, drawn from different and often contradictory accounts. To do this, I dictated copious notes as I went along; and when I had read enough for a chapter,—from thirty to forty, and sometimes fifty pages in length,—I had a mass of memoranda in my own language which would easily bring before me at one view the fruits of my researches. Those notes were carefully read to me; and while my recent studies were fresh in my recollection, I ran over the whole of my intended chapter in my mind. This process I repeated at least half-a-dozen times; so that when I finally put my pen to paper it ran off pretty glibly, for it was an effort of memory rather than creation. This method had the advantage of saving me from the perplexity of frequently referring to the scattered passages in the originals, and it enabled me to make the corrections in my own mind which are usually made in the manuscript, and which with my mode of writing, as I shall explain, would have much embarrassed me. Yet I must admit that this method of composition, when the chapter was very long, was somewhat too heavy a strain on the memory to be altogether recommended.

"Writing presented me a difficulty even greater than reading. Thierry, the famous blind historian of the Norman Conquest, advised me to cultivate dictation; but I have usually preferred a substitute that I found in a writing-case made for the blind, which I procured in London forty years since. It is a simple apparatus, often described by me for the benefit of persons whose vision is imperfect. It consists of a frame of the size of a piece of paper, traversed by brass wires as many as lines are wanted on the page, and with a sheet of carbonated paper, such as is used for getting duplicates, pasted on the reverse side. With an ivory or agate stylus the writer traces his characters between the wires on the carbonated sheet, making indelible marks, which he cannot see, on the white page below. This treadmill operation has its defects; and I have repeatedly supposed I had accomplished a good page, and was proceeding in all the glow of composition to go ahead, when I found I had forgotten to insert a sheet of my writing-paper below, that my labour had been all thrown away, and that the leaf looked as blank as myself. Notwithstanding these and other whimsical distresses of the kind, I have found my writing-case my best friend in my lonely hours, and with it have written nearly all that I have sent into the world the last forty years.

"The manuscript thus written and deciphered—for it was in the nature of hieroglyphics—by my secretary was then read to me for correction, and copied off in a fair hand for the printer. All this, it may be thought, was rather a slow process, requiring the virtue of patience in all the parties concerned. But in time my eyes improved again. Before I had finished *Ferdinand and Isabella* I could use them some hours every day; and thus they have continued till within a few years, though subject to occasional interruptions, sometimes of weeks and sometimes of months, when I could not look at a book. And this circumstance, as well as habit (second nature), has led me to adhere still to my early method of composition. Of late years I have suffered not so much from inability of the eye as dimness of the vision; and the warning comes that the time is not far distant when I must rely exclusively on the eyes of another for the prosecution of my studies. Perhaps it should be received as a warning that it is time to close them altogether."

Thus ten busy years rolled away. During that time appeared the *Life of Columbus* and the *Chronicles of the Conquest of Granada*, the brilliant works of Washington Irving; and it is probable that Mr Prescott felt a natural pang at thus finding himself forestalled by a formidable and already popular rival in two of the most attractive passages of his *History*. After ten years of toil, however, the *History* was completed. Of the work, as it proceeded, four copies were printed in a large type, to enable the author to refer to it with ease, and with ample margins for annotation. It was submitted to the judgment of his father, Mr Ticknor, Mr Sparks, and other friends, and received their cordial approbation. For some time, however, Mr Prescott hesitated to publish it; and it was eventually given to the world in consequence of the urgency of his literary advisers. It appeared (in 3 vols. 8vo) towards the end of 1837, both in Boston and in London. On both sides of the Atlantic its success was great. An article in the *Edinburgh Review* (No. cccxxxviii., 1839), written by Don Pascual de Gayangos, than whom no man was better qualified to judge of its merits, and whose English is no less elegant than his Castilian, pronounced it "one of the most successful historical productions of our time." In the *Quarterly Review* (No. cxxvii., 1839), Mr Ford also expressed his high admiration of a work on which no Englishman was better fitted to pass a judgment than himself, and bade Mr Prescott welcome to the high place which he had at once achieved in English letters. He characterized the book as "by much the first historical work which America has yet produced, and one that need not fear comparison with any that has issued from the European press since this century began." Germany, France, and Spain acknowledged the merits of the new historian by transplanting his work into their respective languages; and the Spanish Royal Academy of History did him and itself honour by enrolling him amongst its members.

Six years later, in 1843, *The Conquest of Mexico* (in 3 vols. 8vo), and in four years more, in 1847, *The Conquest of Peru* (in 2 vols. 8vo), proved that the industry of Mr Prescott was stimulated by success, and that his skill was considerably heightened by practice and experience. In these histories Mr Prescott had not been forestalled by any popular writer; and he led not only his English readers, but the readers of the various European countries into whose languages the works were almost immediately translated, into what were to most of them fresh fields and pastures new. Both *Mexico* and *Peru* were received with immense applause. Like *Ferdinand and Isabella*, they have been frequently reprinted; and they bid fair to remain, for many an age to come, the standard histories of some of the most interesting and eventful periods of human action and enterprise. Their merit obtained for the author unsolicited election into many of the chief literary societies in Europe and America. Amongst other learned bodies, the Institute of France placed his name in 1845 on the list of its corresponding members. The sale of his writings became a source of income, of which the author's share has been estimated at from L.4000 to L.5000 a year.

Peru accomplished, Mr Prescott turned to collect materials, or rather to complete the large stock of materials already collected, for the *History of Philip II.*, the work which he intended to be the great achievement of his later life, and the crown of his historical labours. While preparing for this extensive work, embracing the world's history during the last forty-five years of the sixteenth century, Mr Prescott indulged himself with a short visit to England. He arrived here in the summer of 1850. Many years before, he had passed through England as a young and comparatively unknown traveller; he now returned to it the American whom, of all others perhaps, intelligent Englishmen were most desirous to see and converse with. During his sojourn in London Mr Prescott was one of the most observed and popular personages in a society ever "to famous wits native or hospitable." In truth, he did not need his fame to aid his social success. His fine presence and countenance, his pleasing conversation, and his perfect manners, would have ensured him a welcome even as a nameless stranger. He had the happy gift of at once adapting himself to his company, and catching its best tone; and his varied stores of knowledge, his wide acquaintance with men, quick observation of character, and his even and genial flow of spirits, enabled him, without pause or effort, to find some common ground of thought and sympathy with every one with whom he was brought into brief and casual contact. In the course of a few weeks he became the friend of all the most distinguished members of London society. The university of Oxford conferred upon him the honorary degree of LL.D. In the early autumn he also visited some of his friends at their country houses, and made a brief tour in Scotland. He also crossed the Channel, for the purpose of consulting some of the libraries in Belgium, and of examining some of the more remarkable historical monuments and sites of that interesting country.

Four years afterwards, in 1854, two volumes of *Philip II.* were ready for the press. Mr Prescott had made an arrangement with an English publisher, by which he was to receive L.1000 for each volume of the work, which it was supposed would extend to six volumes. This bargain was, however, subject to the decision of the House of Lords in a case then pending, which involved the question of international protection to literary enterprise. That decision, affirming a previous judgment of the Barons of Exchequer, declared that no American, not domiciled in England at the time of the publication of his book, could claim the benefit of our copyright law, and therefore put an end to the transaction. The letter containing this unpleasant news reached Mr Prescott while he and an English guest, Mr C. R. Weld (who has recorded the circumstance in his *Vacation Tour*, 8vo, London, 1855), were deep in argument on the copyright question. The historian mentioned the new illustration of the hardships to which the state of our international law exposed authors—the annulment of a bargain by which he lost L.6000—with perfect equanimity. If Mr Prescott had thought proper to have resided in England during, and for a certain time before and after, the publication of the book, he might have reaped the full benefit of its great success on both sides of the Atlantic. But he would not take this course. At a great pecuniary sacrifice, he preferred to present the world with one signal example more of the injustice to which the writers of England and America are exposed by the want of a reasonable system of international copyright,—a want for which the American legislature appears to be wholly responsible.

Two volumes of *Philip II.* appeared in 1855. The year following, Mr Prescott supplied to an edition of Robertson's *Charles V.* a sequel, in which he related, in his usual agreeable style, the true history of the emperor's retirement and death; events upon which recently-discovered documents have thrown so much light. In the same year, 1856, he contributed to an American periodical called the *National Portrait Gallery*, a graceful biographical sketch of his old friend Abbott Lawrence, one of the most successful merchants, ablest statesmen, and worthiest citizens of the United States; a sketch which was afterwards published in a separate quarto form.

Mr Prescott's literary labours were carried on during six winter months at Boston, in summer at his marine villa at Nahant, and in autumn at his country house at Pepperell. Soon after the death of his father, which took place in 1844, he removed his town residence from Bedford Street, where the old mansion was soon afterwards pulled down, to 55 Beacon Street, a spacious house overlooking the common, and commanding a fine view of land and water. To the back of this abode he added a noble room to contain his library. Over its western bay window hung two crossed swords: one of these had been worn at Bunker's Hill by his grandfather, Colonel Prescott; the other had been also drawn in that battle by the grandfather of Mrs Prescott, Captain Linzee, who commanded the British sloop Falcon, one of the naval squadron which severely galled the lines of the republicans. The collection of books was extensive and valuable, and related chiefly to the subjects of Mr Prescott's own writings. His own study was a smaller room above, and communicating with this library. The abode at Nahant, in which, during twenty years, he passed the hotter months, was a cottage of two storeys, with a broad verandah, perched on a cliff overlooking the ocean, and washed by its stormy spray. "It is," he said, "the coolest spot in New England; it is called the Fitful Head; and Norna's was not wilder." During the last six years of his life his summers were spent at another house in the same neighbourhood, but less romantically situated, at Lynn Beach. His autumnal retreat at Pepperell was 42 miles from Boston, on the border-line of Massachusetts and New Hampshire. The estate, consisting of some 250 acres, and called the Highlands, lies in a fine undulating country bordered on the N.W. by a wild mountain range. It has been in the family about a hundred and fifty years; and is wooded with fine avenues and groves of oak, chestnut, walnut, and maple. The mansion, an old-fashioned, rambling, roomy farmhouse, with white walls and green blinds, is seated on a gentle eminence overlooking the clear windings and rich pastures of the beautiful Nissitisset. A garden, an orchard, fish-ponds, and green lawns shaded by some noble butternuts, surround the house; and near it a grove of stately oaks leads into a venerable fragment of the primeval forest. Within the porch, the low ceiling and spacious fireplaces, the old furniture, and a closet full of old books, are relics of the simple, homely habits of the past century.

On the 4th of February 1858 Mr Prescott's labours at Boston were interrupted by a slight paralytic shock; but he soon rallied from the effects of it, and his family and friends were under no apprehension of further consequences. From that time he lived wholly on a vegetable diet, and used wine even more sparingly than before. He took less pleasure also in general society, and spent his leisure hours more constantly at home and with his grandchildren, of whose innocent company he was never weary. His sight was for some time a good deal weakened, but it gradually returned to its usual condition, and he was able to resume his literary pursuits for two or three hours a day. Towards the end of the year the third volume of *Philip II.* appeared, and was received both in England and America with the applause to which the author had now been long accustomed.

On the 26th of January 1859 he was at home at Boston. On the evening of that day a friend from New York, the Rev. William Milburn, called upon him. They had not met since Mr Prescott's illness. The guest observed that his host entered the library to receive him with a slower and heavier step than had been his wont in former years, and that in speaking his utterance was occasionally somewhat thick and imperfect. His manner, however, had lost nothing of its accustomed warmth; and he spoke of old friends, living and dead, with his usual feeling and cordiality. Of his own stroke of paralysis he likewise talked with perfect calmness, said it had weakened him and affected his sight, but that he was now able again to take exercise and pursue his work for two or three hours a day. Mr Agassiz, and the interruption of his scientific labours by injured eyesight, were mentioned, and led Mr Prescott to express his sympathy, and to speak of an infirmity which was common both to himself and his guest, Mr Milburn being also partially blind. "These men with eyes," said he, "have us at a serious disadvantage. While they run, we can only limp. But I have nothing to complain of, nor have you. Providence has singularly taken care of both, and by compensation keeps the balance even." He spoke also with warm affection of England, which Mr Milburn had lately visited, and of their friends there. On being asked when he was coming to New York, he replied, "I suppose the days of my long journeys are over, and that, like Horace, I must content myself with my three houses. You know I go at the commencement of summer to my cottage by the sea-side at Lynn Beach; and at autumn to my patrimonial acres at Pepperell, to sit under the trees I sat under when a boy; and then with winter come to hibernate in this house. This is the only travelling, I suppose, I shall do until I go to my long home." These words were spoken almost on the threshold of that final abode. On Friday, 28th January, he was so well that, although the morning was wet, he proposed to take a walk at his usual hour, between seven and eight, to inquire after a sick relative. With some difficulty Mrs Prescott prevailed on him to remain within doors. After breakfast she read to him, as was her habit, the morning papers. She then left him with his secretary in his study. Some time afterwards, about half-past twelve, he rose and went into an adjoining apartment. In a few minutes the secretary, hearing a groan, followed, and found him dead to all consciousness, smitten with a second stroke of paralysis. Medical aid proved unavailing; he never spoke again; and about two in the afternoon he expired.

According to his wish, his body was laid for a while in his library, near the hearth of his affections, amongst his well-beloved books, and beneath the portraits of those to whom his pen had given new life. From thence, on the 31st of January, it was borne to the vault of the Prescott family in St Paul's Episcopal church. It was followed to the tomb by a company such as the death of no man of letters had ever before assembled in America, paying to his great name and noble nature a tribute of tears and mourning "which," as one of themselves remarked, "would have been dearer to his heart than all the intellectual triumphs of his life."

Mr Prescott left behind him a widow, two sons, and a daughter. He never, at any period of his life, took any active part in public business or in politics. Born and educated in the Unitarian persuasion, he adhered to it through life; although for may years he attended the services of an Episcopal congregation of which his old tutor and friend Dr Gardiner was the minister. Of his face and person several excellent memorials remain in the portraits executed in America by Mr Ames and Mr Whipple, and in England, in 1850, by Mr H. W. Phillipps and Mr Geo. Richmond. These, as well as several photographs, have been engraved. Tall and slender in figure, he had a countenance singularly comely, expressive, and engaging. His fresh complexion and his waving brown hair, scarcely tinged with grey, gave him until the last a very youthful appearance. His eminence as a writer was not more cordially recognised than the remarkable worth and beauty of his character as a man. In the management of his affairs, as in the disposal of his time and the arrangement of his study, book-shelves, and writing-table, he displayed a strong love of method and order. Prudent and considerate in small things as well as great, he was liberal in all his dealings, and open-handed in his unostentatious benevolence. Adored by his family and familiar friends, he was hardly less esteemed by the whole society of his native city. In his successes, literary and social, almost every American with whom his friends in Europe conversed appeared to take a personal interest and to feel an honest pride. Amongst the organs of the press, and at the meetings of various literary societies, his death elicited the most touching expressions of regard and respect from many of the most distinguished of his countrymen. "All who knew him," said Mr Bancroft, "will say that he was greater and better than his writings. Standing as it were by his grave, we cannot recall anything in his manner, his character, his endowments, or his conduct, we could wish changed." Mr Ticknor remarked, "that he was loved of all who knew him for the transparent sincerity of his nature, his open and warm sympathies, and for the faithful affections to which years and the changes of life only added freshness and strength." "Of all men whom I have known," said his classmate, Dr Walker, president of Harvard university, "I have never known one so little changed by the hard trial of success and prosperity. At college and on the morning of the day he died he was the same in his disposition, the same in his outward manners, the same in his habit of thought and feeling, the same, to a remarkable degree, in his attitudes and looks. He was one of that happy few whom all love to hear praised."

As a writer, Mr Prescott occupies a distinguished place in the first rank of English historians. His fidelity and industry—qualities which form the foundation of historical merit—are universally acknowledged. It has been doubted, and it is doubtful, whether his powers of philosophical analysis were equal to his skill in synthetical arrangement; whether he could penetrate to vital principles as happily as he could marshal facts and picture events. It is certain that the latter portions of the duty of an historian were those to which he specially applied himself. His practice may be justified on the ground of the subdivision of literary labour which at present obtains, greatly to the advantage of the accuracy of our knowledge. To describe clearly what was done in a particular age, and how it was done, is in itself an important and difficult task; to show why it was done, by discovering the hidden causes which shaped and coloured events, belongs perhaps more properly to writers who take a more comprehensive view of the chart of the world's history. In the art of narrative Mr Prescott has few rivals—very few equals—in our language. So pure and idiomatic is his English that it is rarely indeed that the most critical ear detects, in the use of a word or the construction of a phrase, the transatlantic origin of the writer. The Introduction to the *History of Ferdinand and Isabella*—a review of the early annals and political constitution of Castile and Aragon—is one of the most comprehensive surveys of a great subject ever presented to the historical student. The condition and relations of the crown, the nobles, the clergy, the cities, and the commons, are painted with a masterly hand, and are presented in a picture at once clear, concise, and complete. The wily, able Ferdinand and the good Isabella, the model of womanly heroism, are portrayed with consummate skill and delicacy; and neither Robertson nor Irving has excelled in easy grace the narratives of the siege of Malaga and the crowning conquest of Granada. In the *Conquest of Mexico* and the *Conquest of Peru*, and especially in the chapters on the civilization of the Aztecs and the Incas, Mr Prescott displays great sagacity in assorting the scattered fragments of social edifices, which were destroyed before they could be intelligently delineated, and in recalling to their living forms the dry bones of the extinct races which inhabited them. He also appears to have shaken off the diffidence of a stranger in the historical field. His style betokens more self-confidence, and is bolder and more animated. His descriptions of scenery, in which he is always happy and never redundant, are more full and vivid, and are elaborated with the greater care which was required by the strangeness of unfamiliar lands. Mexico spreads her matchless valley, her lake, and her imperial city before our eyes; we wander through the royal gardens, beneath the giant cedars of Tezcuco; the golden halls of the Inca and the blazing temples of the sun unfold themselves before us; we follow the silver-shod cavalry of Pizarro through the flowery dales of the Cordilleras; or we ascend through the pastures of the llama or the stern regions where the condor hovers in the tropical sun around the peaks of the Andes. The account of the *triste noche*, the rueful night, in which, after the death of Montezuma, Cortes and his band retreated across the lake and along the broken causeway, cutting their way through a nation in arms, is one of the finest pieces of modern historical painting. In the *Reign of Philip II.* unflagging strength and unabated fire are displayed in the treatment of the troubles in the Low Countries, the siege of Malta, the rebellion of the Mexicos, and the battle of Lepanto.

Mr Prescott's chapters on manners and literature are not less lively and picturesque than his record of contemporary events which these chapters illustrate. Of modern historians he was one of the first to acknowledge and to exhibit the importance of this kind of illustration, which his immediate predecessors had been too much in the habit of neglecting. In another respect also his works set an example well worthy of general adoption. Not content with embodying the result of his own researches, he constructed a road to the fountains from whence he had drawn and the mines in which he had toiled, in order, to use his own words, "to put the reader in a position for judging for himself, and thus for revising and, if need be, of reversing, the judgments of the historian." Of all his chief authorities he has left us elaborate biographical notices, showing their means of obtaining a true knowledge of facts, the circumstances and influences to which they were exposed, the complexion of their minds, and the value of their evidence. Were this method of writing history general, we should lose some ingenious books, but we should also escape the noxious influence of many dishonest ones. On those who read critically Mr Prescott's plan must have already had a wholesome effect. From him many such readers must have learned to distrust even the most brilliant of the writing craft who withhold the grounds of their faith and facts, who cite sparingly and loosely, and impudently tell the world that they have drawn materials, perhaps for caricatures of the past and slanders on the dead, from sources so numerous as to defy specification.

As a critic and essayist, Mr Prescott would have attained great eminence had he pursued that path of letters. His essays on Cervantes, Molière, Scott, and Italian narrative poetry are written with much taste and with a just appreciation of their subjects. His reviews are none of them examples of the slashing style of criticism. When he turned aside from his own chosen course, it was for the purpose of throwing some fresh light upon the old masterpieces, or of bidding an unknown fellow-labourer welcome to the temple of Fame. If a blockhead was to be lashed or a knave exposed, he left them to critics who loved to perform such operations. It was very characteristic of his gentle and genial nature that he prefaced his volume of essays, which most readers will be disposed to regard as eminently calm and candid in tone, with the wish "that some of his critical judgments had been expressed in a more qualified and temperate manner." When those who knew and loved Mr Prescott shall have passed away, his memory will still be cherished by his countrymen, not only for the sake of works which will always rank amongst the chief monuments of American literature, but also for the sake of his pure and graceful life, which did honour to the literary calling. (W. S.)

PRESCRIPTION, in *Medicine*, signifies much the same with what in common language is called a *receipt*, being a form of direction for the preparation and administration of some compound medicine. These medical receipts are commonly called *formulæ* by physicians; and the term *prescription* is applied to what is written by a physician on seeing his patient, instructing the apothecary what medicines are to be prepared, how they are to be composed, and how administered to the patient. In this sense, a prescription may contain two or more *formulæ*. These prescriptions are almost always written in Latin, and are expressed in a peculiar style, which, though well known to physicians and apothecaries, may require the illustration of an example. The following is a specimen of a modern prescription as it would be written by a physician, according to the nomenclature of the pharmacopœia:—

For Mr Middleton.
℞. Pulv. Rad. Rhei palmati gr. xxv.
Tartratis Rotassæ ʒij.
Tincturæ Sennæ compositæ,
Syrupi Rosæ centifoliæ āā ʒij.
Aquæ Menthæ piperitæ ℥iss.
M.f *Potio summo mane sumenda.*
Jan. 31, 1859.

From the above example, it will be seen that a prescription, properly so called, contains several circumstances beside the *formulæ* or receipts, as the name of the patient for whom the prescription is written; the signature of the physician, as J. B. for John Balfour; and the *date of prescribing;* none of which should be omitted, as the prescriptions are carefully preserved by the apothecary for future reference.
